

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

Vol. XXVIII.

New York, U. S. A., Thursday, July 6, 1911.

No. 2

WILLYS AND GARFORD JOIN HANDS

They Form a New Selling Corporation with Willys as President—Garford Cars for Overland Agents.

While other matters of moment have been shaping themselves in the industry, John N. Willys and Arthur L. Garford, who have left such plain marks in it, have not been idle. Each saw wherein he could be of benefit to the other, and after some two months of negotiation, the Willys-Garford Corporation has been brought into being, the transaction finally having been consummated yesterday.

It is an important transaction, and one that will cause widespread surprise, but it does not entail all that the title of the new company suggests, for the Willys-Garford Corporation will be a selling company pure and simple, and has for its purpose the marketing of Garford cars and trucks through the Willys-Overland agents. The Garford Co. and the Willys-Overland Co. will remain separate and distinct entities, and each will continue to conduct its manufacturing operations in its own way.

The Willys-Garford Corporation, whose headquarters will be in Toledo, will have a nominal capital of \$10,000, held share and share alike by Willys and Garford, but the actual conduct of its affairs naturally will be in the hands of the Willys staff. John N. Willys himself will be president of the corporation, George W. Bennett, his right hand man, will be vice-president and general manager, and Walter Stewart, treasurer of the Willys-Overland Co., will be secretary and treasurer.

Without conflicting with existing Garford agents they will market the entire product of the Garford factory and the arrangement will give to the Willys-Overland agents the big, impressive cars and commercial vehicles which, with the Overland line at lower prices, will permit them to meet any demand which may arise. In fact, most of

the Overland agents have felt the need for such cars in limited numbers and hitherto have been forced to turn away such orders; with Garford cars and trucks at their command they need do so no longer, and as all of the Garford productions are thoroughly seasoned and of the highest class and as the Willys-Overland agency system is one of the most extensive in the industry, that the transaction should prove mutually attractive is not wholly strange.

Banker Meyer Becomes U. S. Director.

Eugene Meyer, Jr., of Eugene Meyer & Co., has been elected a director and chairman of the finance committee of the United States Motor Co., succeeding Richard Irvin in the latter position. Eugene Meyer & Co. are the New York bankers who organized the syndicate which underwrote \$6,000,000 of the recently authorized debentures issued by the United States Motor Co. and who also had to do with the purchase of the E. R. Thomas Motor Co., of Buffalo, by the new company of that name.

May Make French Carbureter Here.

As the result of a visit to this country by Antonin Boulade, general manager of the Societe du Carburateur Zenith, the Zenith Carburetter Co. has been organized under the laws of Michigan, with \$10,000 capital, and has established a temporary office in the Volksblatt building in Detroit. Later it is probable that a plant will be secured and the carburetter manufactured on this side of the water. Victor R. Heffer will be the manager of the American company.

American Distributing Gets Barnes Gear.

The American Distributing Co., of Jackson, Mich., has taken over the sales agency for the products of the Barnes Gear Co., of Oswego, N. Y. Previously the account was handled by the Centaur Motor Co.

Ford, of Canada, Pays 100 Per Cent.

The Ford Motor Co., of Canada, which operates in Walkerville, Ont., has again declared a 100 per cent. cash dividend. It paid the same amount last year.

TWO ADOPT THE KNIGHT ENGINE

Stearns and Columbia Make Formal Announcements—Stearns Abandons Poppet Valve—Equipments Featured.

After several years, the Knight engine has found honor in its own country. Two of the four American manufacturers whom The Motor World several months ago indicated were preparing to make use of the engine have made formal announcement of the fact. They are the F. B. Stearns Co., of Cleveland, Ohio, and the Columbia Motor Car Co., of Hartford, Conn., and the Stearns company thinks so highly of the sliding sleeve principle that, as evidence of faith, it has burned all of its bridges behind it; which is to say that it has wholly cast out the poppet-valve motor and henceforth will employ only the Knight engine. The Columbia company, on the other hand, will continue to produce cars mounting the poppet valve; the Knight engine model will constitute but one car in its line.

The Stearns motor, which is of the long stroke type, will be rated at 28 horsepower, but will develop 50; the Columbia is rated at 38, but will develop 70. While the latter will be made from imported castings and will be a duplicate of the Knight-Daimler, the Stearns engine will be made wholly in the Stearns shops and will include several features which the Stearns people themselves originated. They are dealt with elsewhere in this issue. The Stearns car will be listed at \$3,500; the Columbia at \$4,500, and these prices include unusually generous equipment. In the case of the Stearns it includes demountable rims, top, windshield, Klaxon horn, trunk rack, electric generator and a complete equipment of electric lamps, including even a tonneau lamp. The Columbia-Knight will be provided with demountable rims, shock absorbers, power tire pump, trunk rack and electric lights.

While the adoption of the Knight engine by both of these well-known companies nat-

urally has created a great wave of comment, the radical action of the Stearns company in entirely casting loose from the poppet valve has caused a general "sitting up."

"Our action speaks for itself," said President Stearns, when the fact was remarked. "We would not dare burn our bridges behind us did we not know our engine and know that it has abundantly and convincingly proved itself. We were doubters when first we took it up, and we have been convinced beyond our will. But two years' experience with it, during which we ourselves spent \$75,000 in perfecting it, has left not a trace of doubt of its superiority in our minds. We believe we have an engine which is not short of wonderful and are certain the future will demonstrate it."

Despite the persistency with which the Knight engine has been kept before the public during the last five years it is still comparatively unknown in this country. Abroad it is better known, six manufacturers at present having it in use. They are the producers of the English Daimler and Rover cars, the German Mercedes, Belgian Minerva, French Panhard and Italian Daimler cars. In Canada it also is used in the Russell cars. This development has taken place within the last three years, during at least two of which a number of American concerns have been studying the qualities of the Knight construction and testing the performance of the engine in various ways.

While much of the credit for its introduction has been claimed by the Daimler Motor Co., Ltd., of Coventry, Eng., the Knight engine really is an American product. Charles Y. Knight, its inventor, is a Chicagoan, or was for many years, and in February, 1906, the Silent Knight car first made its appearance at the Chicago show. This car was equipped with the original Knight engine and was made by the firm of Knight & Kilborne. The following year the car again made its appearance at the Chicago show, its construction having been slightly modified in the meantime. During the two years, 1906 and 1907, the activities of Knight & Kilborne were carried out in a very limited way, a few cars being made and the machine being exploited with fairly creditable results in a number of local hill-climbs.

Within a year of the second appearance of the Silent Knight at the show, however, Knight himself packed his trunk, rolled up a lot of blue prints and took ship for England. There he found the Daimler company willing to listen to his project and eventually succeeded in persuading it to adopt the engine, and incidentally to employ him to develop its construction. When its decision to make the Knight engine a standard feature was announced in September, 1908, the Daimler directorate apparently was in an extremely venturesome mood, for it also declared its intention of producing a front drive motor cab, which, however, failed to make its appearance.

SIX MONTHS OF GENERAL MOTORS

Financial Statement for that Period Indicates Flourishing Condition—New York Exchange Lists Notes.

Concurrent with the listing of its first lien 6 per cent. four year notes on the New York Stock Exchange, the General Motors Co., has made public its financial condition for the six months which ended March 31, 1911. The consolidated statement of profit and loss for that period is as follows:

	Gen. Mot. Co.'s Stockholding Total Proportion	
Gross profit	\$4,387,968	\$3,829,542
Selling, administration, and general expenses	1,142,394	1,068,217
Operating profit	3,245,573	2,761,325
Other income	182,166	170,714
Total income	\$3,427,739	2,932,039
Interest on S. K. notes.....	450,000	450,000
Surplus	\$2,977,739	2,482,039
Previous surplus		1,349,789
Miscellaneous income		183,816
Total		\$4,015,644
Preferred dividends		890,267
Sundry charges		327,883
Profit and loss surplus.....		\$2,797,494

The condensed consolidated balance sheet of the company and its subsidiaries as of March 31, 1911, follows:

Assets.	
Real estate, plant and equipment.....	\$15,253,870
Patents, agreements, etc.....	1,815,719
Miscellaneous investments	506,140
Cash in banks and on hand.....	3,718,521
Notes and accts. receivable.....	4,230,347
Deferred charges	40,976
Manufactured products, finished or in process, materials and supplies.....	23,860,276
Good will, excess of appraised value over book value of stocks of subsidiary companies owned	14,853,855
Total	\$64,279,709

Liabilities.	
Preferred stock issued.....	\$18,038,400
Less in treasury:	
Gen. Motors Co. \$1,882,000	
Subsidiary cos. 1,734,100	3,616,100
Common stock issued.....	19,874,030
Less in treasury:	
Gen. Motors Co. \$3,728,500	
Subsidiary cos. 321,900	4,050,400
Five-year skg. fd. 6% gold notes	15,000,000
Outstanding capital stock...	1,510,270
Surplus to same.....	1,216,239
Notes and accounts payable.....	6,508,185
Reserves	7,001,590
Surplus	2,797,493
Total	\$64,279,709

The company has already paid to the Central Trust Co. under the mortgage agreement \$1,000,000 in advance of the actual sinking fund requirements of \$1,500,000 due next October, and has \$5,000,000 cash in hand which is being used to take advantage of discounts in purchasing materials.

Actual receipts from the sale of cars have

averaged well over \$1,000,000 every week from January 1 to June 16, the latest reported, and orders on hand as of the latter date, for immediate cash delivery, totaled more than \$4,000,000.

It is estimated that the gross sales for the fiscal year ending October 1, 1911, will be \$59,000,000 and the net profits, \$9,500,000. For the same period of 1910, the sales amounted to \$58,500,000 and the profits to \$10,266,322. For 1909, the totals were \$34,000,000 and \$9,257,151, respectively.

Changes Among Prominent Tradesmen.

Paul Picard has been appointed western sales manager for the Fiat Automobile Co. He will make his headquarters in Chicago.

Alexander Dow, former president of the Dow Rim Co., has joined the staff of Wyckoff, Church & Partridge. He will be attached to the New York sales department.

H. W. Bigelow, who for the past two years has been chief accountant for the Hartford Auto Parts Company of Hartford, Conn., has been promoted to the position of supervisor of purchases and sales.

N. H. Minter, formerly special representative of the Stromberg Motor Devices Co., of Chicago, who is "away up" in carbureters, has been advanced to the post of sales manager. E. N. Hynes, who previously was connected with the Stewart & Clark Mfg. Co., has been made chief auditor of the Stromberg company.

Tracy Lyon has been appointed production manager of the General Motors Co. and will have direction of all the plants included in that organization. Lyon at one time was general superintendent and later assistant general manager of the Chicago & Great Western Railway, but more recently and for nearly five years, was production manager for the Westinghouse Electric & Manufacturing Co.

James C. Young, secretary-treasurer and general manager of the Madison Square Garden Co., has been elected vice-president and general manager of the company controlling the new Grand Central Palace in New York. He succeeds Marcus Nathan, resigned. Since their inception, Young has been intimately connected with all of the automobile shows held in the Garden, and now that that historic building is to be demolished, the transferral of his activities to Grand Central Palace conveys its own significance.

A. E. Morrison has been appointed factory director of the Cole Motor Car Co., of Indianapolis, and will rank immediately next to J. J. Cole, president of the company. A few years ago Morrison was widely known in the East, when he first was sales manager for the Peerless Motor Car Co., in Cleveland, and later manager of its New England branch in Boston. His health required that he seek the California climate, since which time he has been sales manager for the Pacific Motor Car Co., of San Francisco, the Cole agents in that city.

NO SIGNS OF EXPORT SHRINKAGE

Statistics for May Show Increased Appreciation of American Cars—Canada Nearly Doubles Its Purchases.

Continued soaring on the part of American automobiles and parts brought the total value for the month of May, last, up to \$1,857,426, of which \$1,513,547 represents the value of 1,466 cars, while \$343,879 is the worth of component exported. The total is \$150,000 more than that for May, 1910.

Canada continues to be the heaviest purchaser of American cars, its takings during May, \$1,107,106, exceeding that of the United Kingdom, the next largest buyer, by more than \$900,000, and representing an increase over May, 1910, requirements of \$442,699. While the United Kingdom still remains second in line, however, its demand fell off to the extent of \$280,000, in round numbers. British Oceania, on the other hand, required \$97,570 more automobile wares than during May, 1910, while the South American market has appreciated to the tune of some \$83,000. The West Indies and Bermuda and the group "other countries" also increased their purchases. Heavy losses were sustained by France and Germany, while Italy, "Other Europe," Mexico and Asia and "Other Oceania" also reduced their purchases.

During the 11 months ending with May, 10,249 cars were exported, as against 5,942 in 1910 and 2,607 for the corresponding period of 1909. The total value of \$13,481,471 was greater by \$4,186,056 than that of the corresponding period of 1910, and greater than that of 1909 by \$8,605,135. In the 11 months' comparison all of the territorial divisions except France, Italy and the West Indies and Bermuda reveal gains. Canada's increase is the greatest, approximating \$2,200,000. British Oceania's gain of roughly \$287,000 is next in order, and that of South America third. In the aggregate the losses of the three falling markets were more than counterbalanced by British Oceania's gain; i. e., Italy, \$122,927; France, \$90,231, and West Indies and Bermuda, \$35,684. The report in detail:

Abbott Increases Capital to \$1,000,000.

The Abbott Motor Co., of Detroit, has increased its capital stock from \$300,000 to \$1,000,000, more than \$500,000 of the new issue being immediately subscribed by the present shareholders. Most of it was taken by the syndicate of eastern capitalists who own the controlling interest in the Abbott company, comprising C. W. Jamieson, president of the company; Senator F. M. Knapp, first vice-president; H. M. Preston, second vice-president, all of Warren, Pa., and W. S. Hoskins, of Weston, W. Va. The board of directors, however, remains the same, viz., C. W. Jamieson, president; F. M. Knapp, first vice-president; H. M. Preston, second vice-president; W. S. Hoskins; Wade Millis, secretary; M. J. Hammers, treasurer and general manager.

May not a Merry Month for Imports.

Only 75 foreign automobiles were imported into the United States during the month of May last, as against 83 for May, 1910. The total value of imports for the month, including parts, was \$205,892, as against \$251,649 lyast year. France has experienced the greatest market shrinkage, sending 26 cars last May, as against 43 in May, 1910, while the United Kingdom sent in 19 cars this year, as compared with only five one year ago. This was the only exception to the "shrink rule," however. During the 11 months ending with May, 771 cars, valued at \$1,642,329, were received at American ports, as against 1,359 cars, valued at \$2,618,217, which were sent in during the corresponding period of last year.

Kissel Prepares to Enlarge its Plant.

The Kissel Motor Car Co., of Hartford, Wis., has purchased another acre adjoining its present property and already has let contracts for the first of two additions, which will be made to its plant. It will be a four-story brick structure, 100x200 feet, which will be ready for occupancy by November 1.

Cartercar Enlargement in Progress.

Work has been commenced on a brick and steel addition to the plant of the Cartercar Co., in Pontiac, Mich. It will afford 10,000 square feet of floor space.

FOR SHORTENING OF SHOW SEASON

Representative Manufacturers Express Approval of Proposal—One Week in New York and Chicago Sufficient.

That the trade has wearied of the long show season which is visited upon it each winter and which seriously interrupts and disturbs the regular order of business for nearly two months, and will welcome any one or anything that promises relief, was fairly well known to those in touch with the trade. But until the Motor World, in its issue of June 22nd, presented the ideas of some of those who believe that action of some sort looking towards the shortening of the season is imperative, the real strength of opinion on the subject largely was a matter of speculation.

That these opinions are likely to lead to the concentration of the shows in New York and Chicago into one week each is quite probable, for those responsible for the suggestion that the cars and the trucks be exhibited during the same week, in two, three, or more buildings, if necessary, are in a mood that is likely to bring matters to a focus much more quickly than may appear to be the case.

In an endeavor to discover the temper of the trade on the subject, the Motor World, without attempting a thorough canvass, obtained the opinions of a sufficient number of men prominent in the several branches and these cannot but add momentum to the movement to shorten the show season which now is under way. Among those who were not unwilling to be quoted were the following:

Charles T. Jeffery, president Thomas B. Jeffery Co.—"The automobile shows are not infrequently referred to as necessary evils. Two national shows of pleasure cars—one in New York and one in Chicago—should not be looked upon entirely as evils, for with exhibitions in both places such as that in Chicago, public interest is certainly stimulated and interest kept alive and created which would otherwise die out much quicker.

"The advantage gained to a manufacturer by the stimulation of interest is such as to warrant the trouble necessary for one week exhibition in both places, but the advantage gained through an additional week hardly offsets that lengthened interruption to the usual routine.

"We should very much favor the exhibition of commercial vehicles in Chicago during the same week as that of pleasure cars, and one general show of all pleasure cars and commercial vehicles during the single week in New York; such exhibitions, if necessary to obtain sufficient room, to occupy various buildings, even though set apart. Aside from the time saving to the manufacturers of such a plan, it would seem

	May		Eleven months ending May		
	1910	1911	1909	1910	1911
Automobiles and parts of—					
Automobiles	\$1,491,497	\$1,513,547	\$4,340,165	\$7,910,379	\$11,262,177

Other countries	15,437	28,042	78,018	148,648	281,270
Total	\$1,700,100	\$1,857,426	\$4,876,336	\$9,295,415	\$13,481,471

to assure a larger attendance at the commercial vehicle exhibit."

Albert L. Pope, president, Pope Manufacturing Co.—"The shortening of the show season is a subject in which I am very much interested, and is one that I think concerns the whole industry. I will sum up my ideas on this matter in as few words as possible. I fully believe that the National Association of Automobile Manufacturers should conduct all the shows that are held in New York and Chicago in the future, beginning this year, if possible; that some arrangement should be made with the board of trade by which the National Association could take the lease of Madison Square Garden off its hands, and that as there is not sufficient space in Madison Square Garden that other buildings should be hired, so that the exhibition of pleasure cars, trucks, motor bicycles and accessories can be held in one week. That is sufficient time for every one to see all they wish, and will make it much less expensive for the manufacturers and dealers. They will be enabled to get all the information they require in that one week without the necessity of going again to see the trucks. I shall use all the influence I have to have the show matters settled as above."

Benjamin Briscoe, president, United States Motor Co.—"Allow me to express our approval of the plan for shortening the show season, if it can be successfully carried out. Every automobile manufacturer would gladly see the show season reduced. We believe in shows and will continue to believe in them just as long as they are supported by the general public; following which undoubtedly will come those strictly trade shows such as other industries support."

"The difficulty, however, of shortening the show season lies in the inability to get big enough buildings to properly house our great industry. Last year at Madison Square Garden some eighty automobile concerns took all the space available the first week, and even then each company had to accept a smaller amount of space than was actually needed. Then followed the commercial vehicle show for one week, which this winter should be a show of as great proportion as the one offering pleasure cars."

"The ideal situation would be to have two buildings in New York, one in which pleasure vehicles could show for one week, while the other building could care for the commercial vehicles during the same period, all the representative companies being given space. This much desired condition may be brought about by the erection of new buildings in New York and Chicago, but it hardly seems possible under existing conditions. As a matter of fact, there are no two buildings in any city of this country that can properly house in a single week this great American industry of making motor cars."

Charles G. McCutcheon, president Amer-

ican Gear & Manufacturing Co.—"As parts makers, we long since gave up the idea of exhibiting parts at the shows. As a matter of fact the car manufacturers have usually determined upon the purchase of all the parts to be used in their current models before the shows are held, and the benefit derived from exhibiting at these shows is entirely out of proportion to the expense incurred, except it may be in the case of a new and unknown manufacturer."

"Please understand that this attitude applies only to the mechanical parts used in the construction of cars, such as engines, transmissions, axles, springs, frames, etc., and not to accessories, which are of considerable interest to the intending purchaser of cars. We presume the accessory makers derive some benefit from the shows. Undoubtedly the manufacturers of cars find in the shows a good method of exploitation."

"It certainly seems that if the shows can be consolidated and two national representative shows held each year, one in New York and the other in Chicago, that the purpose of these shows would be fully served by making them of one week's duration in each city. We believe the trade generally would entirely approve of the limiting of time spent on these shows to one week each. We believe that practically as much good would be accomplished by shows of one week's duration and at approximately half the expense of shows lasting two weeks. We think there is no question but that people sufficiently interested to attend the shows could very well manage it in one week's time. The extension of these shows beyond one week not only means a great expense in money cost, but even a larger expense in the loss of time and to the general interruption of business at the factory."

Charles Clifton, treasurer, Pierce-Arrow Motor Car Co.—"I can only say Amen to all that is said by the Motor World in its issue of June 22 regarding the shortening of the show season."

D. W. Henry, general manager, Colby Motor Co.—"I heartily agree with the suggestions regarding shortening up the shows and believe it is the best thing for all automobile shows and dealers throughout the country to have one big show in New York and one big show in Chicago, lasting one week in each place. I for one would be very thankful to see it carried out."

H. Hess, general manager, Franklin Automobile Co.—"We are strongly in favor of one-week shows."

H. Krohn, sales manager, Paige-Detroit Motor Car Co.—"We are heartily in favor of shortening the show season. We believe that one week both at Chicago and New York is sufficient, and all manufacturers will accomplish the same results with less time wasted, and we trust that this thing will be brought about."

C. C. Hanch, treasurer, Nordyke & Marmion Co.—"In my opinion, one week is certainly enough. If space is available, I believe that every reputable manufacturer,

and all kinds of vehicles, should be let in at the same time."

F. Hallett Lovell, Jr., president, Lovell-McConnell Manufacturing Co.—"It is our opinion that the shows should not be more than one week and that the whole show season should be entirely shortened. Business is practically blank in the month of January, all due to the show proposition. We would rather prefer that the automobile shows should be discontinued altogether, from our standpoint."

William E. Metzger, secretary and treasurer, Metzger Motor Car Co.—"Provided suitable buildings of suitable capacity can be found in New York and Chicago. I heartily concur with your sentiments as expressed in The Motor World's articles regarding the national shows in your issue of June 22, and believe that one week only should be given New York and Chicago, and that these shows should follow each other with as small elapse between them as possible. A manufacturer should not be burdened with show troubles for over a period of three weeks. I hope that this idea will be effective for the shows of 1913."

Wm. Sparks, secretary-treasurer, The Sparks-Withington Co.—"The automobile shows certainly should be cut to one week only. Judging from our experience last year the second week of the show is an unnecessary expense. Therefore, it seems to me that the management should try and provide a building large enough in which the show could be divided into two sections, one for pleasure and the other for commercial vehicles to be shown at one and the same time. We really hope this can be brought about."

E. W. Lewis, secretary and treasurer, Timken-Detroit Axle Co.—"We have read with interest The Motor World's article bearing on the show question. We could hardly add a single word to the opinion taken regarding same. It covers our case thoroughly; in other words, at least not as far as we are concerned, we do not want to see more than two national shows, and each should not extend beyond a week."

"We feel that we have to attend these shows, although we have nothing to sell the public, and it is certainly not a propitious time for use to show our goods to the motor car builder, as he is busy selling his cars. While we cannot afford to drop out of the two national shows, we think this is practically the same way every accessory company looks at the question."

E. P. Hovey, advertising manager, C. F. Splitdorf, Inc.—"We have read the editorial of The Motor World regarding the shortening of the show season and most heartily say Amen to every word it contains. There is very little for us to add, as your editorial meets our views exactly. One show of a week's duration is enough."

Wm. Gray, Gray & Davis—"If it were possible to have the show last about three days and one night it would please me very much."

William E. Dunbar has opened a garage in Manchester, N. H.

D. S. Hayward has begun the erection of a garage in St. Cloud, Minn.

The Carson Garage & Auto Co., of Peru, Ind., has filed notice of dissolution.

C. H. Adams is erecting a concrete garage on Chestnut avenue, Waterbury, Conn.

The Brooks Motor Co. has taken possession of its newly completed garage on West Broadway, Muskogee, Okla.

A. V. Stimler has opened a fire-proof garage at Foley, Minn. It includes a fully equipped repair department.

A new garage and repair shop has been opened by W. S. Brown in Wilkesbarre, Pa. It is located at 156 West River street.

The Goodyear Tire & Rubber Co. has entered suit in the District Court at Hutchinson, Kan., against the Sellers Motor Car Co., to recover \$4,120.43, alleged to be due on a note, and \$3.86 protest fee.

Ground has been broken for a modern garage at North Second and G streets, Tacoma, Wash. The building will cost \$10,000. When finished it will be occupied by Jesse O. Thomas, Jr., the owner.

Ernest Johnson, a Berkley Springs (W. Va.) liveryman, will abandon the care of horses for the automobile. On the site of his old stable, on Main street, he is preparing to erect a modern fire-proof garage.

Rochester, N. Y., is to have still another garage. It will be erected by George W. Hastings, at a cost of \$22,000. The building will be a three-story brick structure, with entrances on both Court and Courtland streets.

Ralph C. Hamlin has let contracts for the erection of a three-story fire-proof garage and salesroom in Los Angeles, Cal. It will have a frontage of 50 feet on Oliver street, near Tenth street, and a depth of 158 feet. It will house Franklin automobiles exclusively.

John S. and Daniel A. Harrington, who, under the style The Harrington Automobile Co., maintain stores in Worcester, Mass., and Providence, R. I., have formed a new firm, Harrington Bros., and will open another store in the Copley Square district of Boston. They will handle the Everitt line.

The Firestone Tire & Rubber Co. has leased the premises 724 Main street, Buffalo, N. Y., which early in July will be opened as a factory branch—the thirty-fifth link in the Firestone chain. The new depot will be in charge of Raymond W.

Phelps, hitherto connected with the Firestone branch in New York City.

Joseph Holloway, principal owner of the Holloway Automobile Agency in Wheeling, W. Va., has purchased the interest of Julian Hearne in the Hearne Motor Car Co., located at Fifteenth and McCollough streets in the same city. The business of both hereafter will be combined under the style the Holloway & Hearne Motor Car Co., with J. Holloway and Thomas McK. Hearne as the partners. The new concern will continue to handle the National and Reo cars.

LOCOMOBILE'S NEW SERVICE BUILDING.
To be Erected in New York City on 61st Street,
Near Broadway.

J. I. Handley, president of the American Motors Co., of Indianapolis, and Charles E. Reiss, of Charles E. Reiss & Co., New York distributors of Marion cars, have incorporated the American-Marion Sales Co., under the laws of New York, and the new concern, which is capitalized at \$100,000, will henceforth handle both cars in the metropolitan district. The Marion being a popular priced car and the American, which set the fashion in the underslung types, being a big, impressive creation, will permit the Sales company to meet the demand for either kind.

Recent Losses by Fire.

Ridgefield Park, N. J.—The Motor Repair Co.'s garage, Bergen avenue, burned; four cars destroyed. Loss, \$10,000.

Greenville, S. C.—Eugene F. Bates' garage, North Main street, damaged; eight cars and other contents destroyed. Loss, \$12,000.

Detroit, Mich.—Zenith Carburetter Co., under Michigan laws, with \$10,000 capital. Corporators—Victor R. Heftler, of Detroit; Antonin Boulade, Lyons, France.

Jackson, Miss.—Velie Motor Sales Co., under Mississippi laws, with \$10,000 capital; to deal in motor vehicles. Corporators—H. K. Hardy, H. D. Hardy, W. P. Hardy.

Boston, Mass.—A. S. Brock Rubber Co., under Massachusetts laws, with \$25,000 capital; to manufacture all kinds of rubber goods. Corporators—A. S. Brock and others.

Danville, Ill.—Inland Supply Co., under Illinois laws, with \$35,000 capital; to manufacture machinery and motors. Corporators—H. C. Yelon, O. Finney, G. Harroun, all of Danville.

Bloomington, Ill.—Gillett Vulcanizing Co., under Illinois laws, with \$2,400 capital; to repair and deal in automobile tires, rubber goods, etc. Corporators—C. M. Gillett, K. P. Phares, F. M. Roosa.

Decatur, Ill.—Gillett Vulcanizing Co., under Illinois laws, with \$2,400 capital; to repair and deal in automobile tires, rubber goods, etc. Corporators—Robert R. Munsie, Walter H. Weaver, C. M. Gillett.

New York, N. Y.—Auto Trucking Co., under New York laws, with \$10,000 capital; to deal in and rent automobiles, delivery cars, etc. Corporators—Samuel Simmons, Henry Frohwitter, Samuel Steiner.

Indianapolis, Ind.—Merchants' Electric Auto Co., under Indiana laws, with \$50,000 capital; to deal in automobiles. Corporators—H. B. Stout, M. L. Darrow, J. E. Spiegel, C. P. Tighe, H. B. Stout, Jr.

Chicago, Ill.—Chicago Motor Transportation Co., under Illinois laws, with \$100,000 capital; to do general automobile and auto livery business. Corporators—John J. Nolan, Arthur Bird Haven, Peter Sinclair.

Manteno, Ill.—H. Smith & Sons Co., under Illinois laws, with \$20,000 capital; to manufacture and deal in motor vehicles. Corporators—Samuel J., Joseph O., Raoul E., Edward E., Napoleon and Armand E. Smith.

Yonkers, N. Y.—Lowa's Garage, under New York laws, with \$30,000 capital; to manufacture and deal in automobiles, supplies and accessories. Corporators—W. Lowa, W. Lowa, Jr., C. W. Lowa, all of Yonkers.

Increases and Decreases of Capital.

Detroit, Mich.—Abbott Motor Co., from \$300,000 to \$1,000,000.

Port Huron, Mich.—Lauth Auto & Engine Co., from \$50,000 to \$20,000.

Quick-Detachable and Quick-Detachable Demountable RIMS

"The Lightest Practical Rims Made"

Quick-Detachable Demountable Clincher Rim

The all important requisites of a real dependable rim—the features you must consider—are embodied in their entirety in Firestone rims for

1912

**Greatest Possible Strength—
Least Possible Weight—
Simplicity and Speed of Operation—
and Absolute Safety**

They do not require a special tool—an ordinary screw-driver will do to detach a tire and a brace wrench to demount a rim—no delicate mechanism to get out of order or clog with mud from the road. No knowledge of mechanics necessary.

SAVE YOUR TIRES—Firestone rims are made under the direct supervision of the world's most successful tire makers; men who know how to make a practical tire-saving rim; men whose years' of experience have taught them—that a rim with a broken or split rim-base will ruin the best tires that money can buy.

Firestone rims have a

No-Split Rim-Base

and will save their owner a great deal of tire-trouble and tire-expense.

Quick-Detachable Clincher Rim

**Modern Machinery and Unlimited Capacity Enable Us
to Make Prompt Deliveries of All Standard Sizes.**

Torture Chambers on Touring Cars.

The terrific and widespread heat wave which has swept the country during the current week has served to convince many persons that front doors on touring cars and side doors on runabouts and roadsters are not all that fancy had pictured. However comfortable may be the passengers on rear seats, the occupants of a closed-in seat which is in close proximity to the engine are subjected to a degree of heat that is suggestive of the infernal regions. During torrid spells such a seat becomes literally a sweat-box and torture chamber. Unless he has asbestos soles and has more of it in his make-up, the man who values creature comfort will detach the door, even though it may slightly sacrifice the looks of his car.

One thing already has been made certain: Front doors either must be made readily detachable or the front half of a closed touring car must be provided with ventilators of some sort, and unless they are ample

they are little better than none at all. In designing their new models, manufacturers should not lose sight of the fact.

The merciful man should be merciful to his chauffeur and his occasional guest, even if he himself does not occupy the front seat. It is not strained mercy, but the refinement of torture to coop either employe or guest over a hot engine on a hot day.

About Driving "On the High."

In the beginning the average chauffeur may have a few sparks of mechanical intelligence about him, but once he has passed through his schooling and, like Private Tommy Atkins, has been taught "how to walk and where to put his feet," it matters little who, or what, he was before. "Once he's pocketed the shilling and a uniform he's filling," he becomes—a regular chauffeur. Which is to say that he becomes a creature of fixed tendencies and one overpowering obsession, namely, to "put her over on high." Of course, there are drivers other than hired men who incline to make undue use of the high gear, usually those who, once having obtained that seemingly difficult combination, hesitate to abandon it lest they be unable ever to regain it. As a rule, however, it is the professional driver who is the worst offender in this particular respect, and though there are welcome exceptions, they simply serve to prove the rule.

"Now, on the other side," as returning travelers love to explain, they do differently. In England, and even to a greater extent on the Continent, "good form" demands that a car be driven on as many speeds as there are notches outside the latch, and in most cases there are four. Every time the car approaches an appreciable grade, back goes the lever into the next position, the car speed is reduced and the engine speed remains practically constant. In this country it would seem almost as though the average driver considered it a disgrace to run on anything but the high gear, while in Europe a driver who attempted to force his car until the engine began to labor probably would consider himself equally disgraced.

There is absolutely no reason why drivers should not acquire sufficient understanding of the machine to appreciate what injury is done when the engine is overloaded, as it always is when an unduly high gear is used. Gears are made to be used; use them the careful driver does and the driver who is

inclined not to use them or who habitually avoids their use is to be condemned as either incompetent or heedless of consequences, or both.

The Way to Open the Speedways.

The movement undertaken by the Licensed Automobile Dealers of New York to have the Harlem Speedway thrown open to the public is a step in the right direction. For the Speedway has outlived its chief purpose, if ever it had any other purpose than providing a playground or a training ground for a handful of owners of fast horses.

Its construction at a cost of \$6,000,000 is a fair illustration of the manner in which longsuffering taxpayers can be imposed upon and mulcted for the benefit of a few men possessed of political influence. Despite the fact that all taxpayers paid for its construction and for nearly 20 years have paid for its maintenance, only owners of light horse-drawn carriages are permitted to use it; all others are shooed away by police especially detailed to preserve the expensive property for the use of perhaps half a hundred men who drive fast horses attached to racing sulkies or wagons, and who long have monopolized its use. Those owners of other "light horse-drawn vehicles" who are not given to speeding gingerly tread the extreme edges of the Speedway.

Though the Licensed Dealers doubtless will encounter mighty opposition in their effort to have this gigantic semi-private road restored to the public, the effort is well worth while. They probably will have to "go into politics" before they meet with any measure of success, the New York Supreme Court's recent decision that it was legal for the State Legislature to take from the people a mid-section of the Coney Island Boulevard and give it to a corporal's guard of horsemen for speeding purposes, making evident that counter legislation is necessary. And the only argument the politicians who constitute the average legislature is the argument of the ballot.

"Going into politics" does not mean merely writing letters to candidates or office-holders and receiving evasive or diplomatic responses—as was done last fall by the New Jersey club, which made itself believe that it was "playing politics." It means picking out a candidate or two and licking him at the polls; and the automobile vote now is large enough to make that end at-

tainable. It will not require more than one licking or two to convey wholesome understanding to the politicians, and while such apparent class action may appear undesirable, the end justifies the means, since no other avenue seems open.

Much wiser in their generation, the cycling leaders early made the politicians appreciate the meaning of the "bicycle vote," and thus eased the cyclist's burden. It is not too late for the automobilists to profit by that experience. Then not only the Harlem Speedway, but the State of New Jersey and many other places speedily will be opened to them.

"Equipment" as a Selling Factor.

It is now in order for the oracle that annually indicates the leading trend of the industry to arise and announce the single word, "equipment." For several years past makers of cars of the medium-priced class have been inclined to seek added inducements for the purchaser through the inclusion in the selling price of what hitherto had been considered rather in the light of luxuries. Thus, it is not so very long since the "giving away" by the car maker of headlights and generator or gas tank, was considered a piece of noteworthy liberality. Following the headlights, came the magneto, then the trunk rack, robe rail, shock absorbers, quick detachable rims, and later, demountable rims. Finally, to the list was added occasionally a special inducement in the way of top and windshield. Relatively speaking, a car thus outfitted still may be said to be "fully equipped."

With the gradual unfolding of manufacturing plans for next year, it now begins to be apparent that fully equipped cars are to be the rule, rather than the exception, that equipment is to be one of the features of next year's business. Not only this, but the scope and quality of the accessories listed in the new catalogs reveals a higher tone than ever before. Furthermore, it is evident that the full equipment of cars hereafter is not to be confined to cars of the intermediate class. To other inducements have now been added such luxuries as electric horns, lighting generators and, following the initiative of one or two makers last year, power-driven tire pumps. The compressed-air starter, likewise, is beginning to loom large, that device having acquired two additional adherents within a few weeks. These fittings de luxe, appear

only on cars that otherwise would seem to be beyond the range of closest competition and, therefore, may be considered as evidence of a new attitude in the trade toward the equipment feature.

The really significant point is that in almost every case, the elaborate outfitting of the machine is assumed as a genuine inducement; it is neither advanced as an excuse for raising the price, as a subterfuge to avoid cutting the price, nor as a means of getting rid of an overstock of manufactured machines. The buyer of the fall of 1911 or the summer of 1912 will get more for his money than ever before; there can be no question of the fact. Moreover, as the manufacturer's selection and method of installing accessories is superior to the similar service performed by the average agent or garage man, because performed on a quantity scale, the result will be that the buyer will get better results for his money's worth as well as more than in the past.

Question: Why would it not be cheaper in the end to put down hard pavements of

a permanent nature on well-traveled thoroughfares than it is to go on patiently resurfacing the old-style roads year in and year out? On the theory that it is better economy in the end to put down even a better and more lasting pavement than the traffic of the day may seem to demand, not a few communities are laying wood-block or brick surfaces, which, if based on proper foundations, should prove even more durable than they do under the constant stress of city travel. Of course, the expense is great and, naturally, it is easier to tinker with the "roof" of an existing road that was considered a pretty good road when it was built than it is to begin at the beginning and replace the old with the new. But, just for the sake of argument, why would not the latter course be the cheaper and hence the more profitable in the long run? How many new surfacings will it require to offset the cost of a hard and practically permanent road? The New York Park Department, for instance, ought to bring itself face to face with the questions, which are of interest to other road tinkers, also.

BURMAN'S BIG DAYS AT BRIGHTON

Moross's Star Adds to Brilliance of Two Days' Meet—But There Were Others, Including Don Hess.

Headed by Robert Burman, who captured the richest prize at stake, the Remy Brassard, not inaptly dubbed the "meal ticket," and who also created a new world's record for mile dirt tracks, the Moross racing "sta-

ter itself was far above fever heat, too.

The races themselves were run off without accident, though two fatalities were recorded as the result of practice. C. R. Robinson, S. P. O. pilot, skidded into an oil wagon on the day before the races and subsequently died. In attempting to pass Len. Ormsby, who had turned his Simplex, and, contrary to rules, was proceeding to the paddock in the wrong direction, H. Frye, driving a Mercer, was forced into the fence in practice on the morning of the first day,

proven that the old manual of arms, in use at about the time of the Civil War, has not disappeared entirely. Garbed in khaki uniforms, alleged to have been brought all the way from the Indianapolis Speedway, and carrying antiquated, muzzle-loading rifles, which appeared to antedate that historical period, Moross's own "army," facetiously dubbed Moross's Foot Guards—they guarded their own feet by reclining at length on the grass during the greater part of the program, though they were supposed

BURMAN MAKING A RUNAWAY IN THE RACE FOR THE REMY BRASSARD.

ble" made considerable of a "clean up" on Monday and Tuesday, July 3d and 4th, at Brighton Beach, the occasion being a two day's racemeet which inaugurated the racing season in the Metropolitan district. There may be those who hold that this result was not altogether to be wondered at in view of the fact that Moross himself was chiefly responsible for the whole affair, but be that as it may, be it said to the credit of his troupe that at the least it furnished

and sustained injuries which resulted in his death. Ormsby was suspended by the referee.

Several things were demonstrated during the two matinee meets. One of them was

to be pacing to and fro like real soldiers—did the proving. If there is a suspicion that they were not really militant—at least in appearance—the accompanying illustration, which shows the entire "army" in two detachments, should dispel all doubts.

Interest on the first day centered around the performance of De Palma. He drove the 90 horsepower Simplex formerly handled by George Robertson to such good purpose that he landed in front of the fields

MOROSS FOOT GUARDS—1ST BRIGADE.

enough fast driving, excitement and close finishes to keep at fever heat one of the largest crowds that has gathered at the seaside track in some time, during nearly all of both afternoons—and the thermom-

DON HERR, A RISING STAR.

that De Palma isn't such a fearfully fast driver after all. De Palma drove a mile at Syracuse last fall in 48.92 seconds, thereby establishing a record for mile dirt tracks, but Burman shaved this to 48.72 seconds during the second half of the program—only one-fifth of a second better, but still enough to pull the props from under De Palma's record. Another of the things which was demonstrated was that, contrary to popular belief, there really is a cool spot in the vicinity of New York, even on the hottest days. And last, but not least, it was

MOROSS FOOT GUARDS—2ND BRIGADE.

in both the five miles race for cars in the 600-inch class and also in the 60 miles event. Third place in the first of three heats at three miles for the Remy Brassard finished his day's work. The longer event, which

was scheduled as a one-hour race, but which was changed to 60 miles at the last minute, really was the feature race of the day, and De Palma did not have things all his own way in winning. It was a real race from start to finish.

De Palma, Disbrow (Pope-Hartford) and Hughes (Mercer) ran one, two, three, up to the thirty-fifth mile, when tires commenced to pop. Disbrow was the first to stop, and almost before he got away De Palma ran into the paddock, leaving Hughes for the moment in undisputed possession of first place. De Palma got back on the track before Disbrow came around and tagged along behind Hughes in second place. A

hero in the other light car race—for cars in the 231-200 inch class—and he left B. Forster (Correja), winner of second place, far behind. John Jushasz, in an S. P. O., was third. The third race was more deserving of the name and embraced a tough scrap between Patschke, who drove a Benz, and Fay Sheets in a National. Sheets led for practically the entire distance, and it was not until the stretch was reached that Patschke was able to nose him out. He won by inches only, with Knipper, piloting a National, third. De Palma never was headed in the next event, which was for cars having up to 600 cubic inches piston displacement, and won handily in 4:45.93,

recently promoted from mechanic to driver. De Palma led all the way up to the 7th mile, with Herr, driving the National handled by Zengle on the first day, so close that he could have reached out and touched the leader at any time. The rest of the cars were so far in the rear that when De Palma's Simplex broke a spring clip in the beginning of the 8th mile Herr had things all his own way and won by nearly a quarter of a mile. His time was 9:16.18, and Fay Sheets (National) was second. Later Herr gave another spectacular exhibition and proved he was the equal of the others at least, by winning the pursuit race after all but Disbrow had been overtaken.

PATSCHE (BENZ) GOING TO THE FRONT.

HERR AND SHEETS (NATIONALS) IN 50 MILES.

little later Hughes also had his share of tire trouble and was shoved back from first into third place before he got in the running again. At the 45-mile mark these three were running in the same positions as they were at the halfway post, viz., De Palma, Disbrow, Hughes.

Thereafter it was all De Palma, the only excitement being caused by the fight between Hughes and Disbrow for second place. Time after time Hughes forced his Mercer up on an equal footing with Disbrow's "Hummer" and once—in the 51st mile—he succeeded in leading the Pope pilot, though only for a very short time. In the 56th mile Disbrow's hopes were shattered when he was forced to stop to make a tire change and was unable to make up the lost time; he was forced to be content with third place. De Palma's time was 59:21.37.

The first two races of the day were uneventful, the winner going to the front at the crack of the gun and staying there, winning in each case by almost half a mile. Jack Tower, in an E-M-F, scored the first runaway in the race for cars in the "baby" class—161-230 cubic inches piston displacement; Armour Ferguson (Lancia) was second, and Jack Craig (Paige-Detroit) was third. Hugh Hughes (Mercer) was the

with Zengle and Sheets, both in Nationals, second and third, respectively.

The final event was one of the grandest mixups that has occurred in some time. It was slated as a five miles free-for-all handicap, but when Starter Wagner announced it to the drivers as a ten-mile race and gave the word GO to the drivers of the three Paige-Detroit cars who had the long marks, all except four of the contestants started. The others were flagged on the first lap, and in the confusion which resulted, two of the Paige-Detroit cars came together and were put out of the running. When the race finally was started, all but five drivers had been disqualified, and Hughes (Mercer) won quite easily from the 30-second mark.

As was the case on the first day, the two light car races run off on the second day proved easy for the winners, the margin by which they were won in each case being considerable. Jack Tower (E-M-F) repeated his victory in the 161-230 inch class and Tryon, who drove a Correja, accounted for the event for cars in the next larger division. Both were at five miles. A ten miles race for cars in the 600-inch class proved the first really exciting event of the day, and evolved what appeared to be a new star in the person of Don Herr, but

Tire trouble caused the Hummer's pilot's downfall at the 23d mile, and Herr won again.

It was just after this that Burman made his attempts at the mile record. His first try was slow and netted him 57.07 seconds, considerably more than the 48.92 seconds which constituted the record. His second trial looked still slower, as it was less spectacular, Burman hugging the fence closely and failing to throw up the immense cloud of dust which characterized his former attempts. Appearances were deceptive, however, and he received a great ovation when it was announced that he had bettered the world's mark by just 20/100 of a second.

The 50 miles race for cars in the 600-inch class was characterized by a further exhibition of Don Herr's almost perfect driving. Up to the 27th mile he and his National looked like sure winners. Disbrow, though running second, being a long distance behind, and Cobe in a Jackson still further back in third place. Otto Rost (Crow) and L. Anderson (Marion) had been lapped several times and never were dangerous contenders. Just after the 27th mile post had been passed, Herr's star, heretofore in the ascendant, took a drop, and he was forced to retire with a broken valve. Thereafter Disbrow's lead was never seriously

in danger, in spite of the fact that he made a stop to change a tire. Cobe also had to stop, and though eventually he got second place he was several laps behind at the finish. Disbrow's time was 51:59.10.

Both the second and third heats for the Remy "meal ticket" were won by Burman,

and, William Tryon, Colby. Time, 8:11.56.

Three miles, free-for-all, first heat for Remy Brassard—Won by Wm. Knipper, Benz; second, Robert Burman, Benz; third, Ralph De Palma, Simplex. Time, 2:41.68.

Sixty miles, non-stock, up to 600 inches displacement, minimum weight, 2,100 pounds

Tuesday, July 4.

One mile time trials—Robert Burman, Benz, 51.07 and 48.72 seconds. A. Hummell, Mercedes, 58.57 seconds.

Five miles, non-stock, 231-300 inches displacement—Won by Tryon, Correja; second, L. Anderson, Marion; third, Otto Rost, Crow. Time, 5:33.91.

Five miles, non-stock, 301-450 inches displacement, minimum weight, 1,800 pounds—Won by Cyrus Patschke, Benz; second, Louis Disbrow, Pope-Hartford; third, Wm. Knipper, National. Time, 4:43.47.

Ten miles, non-stock, up to 600 inches displacement, minimum weight, 2,100 pounds—Won by Don Herr, national; second, Fay Sheets, National; third, Louis Disbrow, Pope-Hartford. Time, 9:16.18.

Remy Brassard—Won by Robert Burman,

Three miles, free-for-all, second heat for Benz; second, Wm. Knipper, Benz; third, Cyrus Patschke, Mercedes. Time, 2:37.38.

Three miles, free-for-all, third heat for Remy Brassard—Won by Robert Burman, Benz; second, Wm. Knipper, Benz; third, Cyrus Patschke, Mercedes. Time, 2:56.08.

Australian pursuit race, non-stock, free-for-all—Won by Don Herr, National; second, Louis Disbrow, Pope-Hartford; third, C. Lund, Simplex. (23 miles.) Time, 23:14.97.

Fifty miles, non-stock, up to 600 inches displacement, minimum weight, 2,100 pounds—Won by Louis Disbrow, Pope-Hartford;

AN OFFICIAL WRANGLE—BURMAN AN INTERESTED LISTENER.

and he had an especially easy time. He drove the so-called "Blitzen Benz," at one time the property of Berna Oldfield—who looked on—and simply walked away from the others. At least he walked from them in the second heat; why he did not repeat his performance in the third instead of alternating in the lead with Knipper is open to conjecture. At any rate, Moross ran out on the track just before the start and whispered in Knipper's ear. But Burman won anyway, though it looked like anybody's race up to within 300 feet of the finish line.

The summary:

Monday, July 3.

Five miles, non-stock, 161-230 inches displacement—Won by Jack Tower, E-M-F; second, Armour Ferguson, Lancia; third, Jack Craig, Paige-Detroit. Time, 5:48.86.

Five miles, non-stock, 231-300 inches displacement—Won by Hugh Hughes, Mercer; second, B. Forster, Correja; third, John Juhasz, S. P. O. Time, 4:55.51.

Five miles, non-stock, 301-450 inches displacement—Won by Cyrus Patschke, Benz; second, Fay Sheets, National; third, Wm. Knipper, National. Time, 4:47.74.

Five miles, non-stock, up to 600 inches displacement, minimum weight 2,100 pounds—Won by Ralph De Palma, Simplex; second, Len Zengle, National; third, Fay Sheets, National. Time, 4:45.93.

Five miles, free-for-all novelty race for touring cars—Won by Lane, Hudson; sec-

Five miles, free-for-all handicap—Won by Jack Tower, E-M-F (40 seconds); second, Louis Disbrow, Pope-Hartford (scratch); third, J. Craig, Paige-Detroit (55 seconds). Winner's time, 5:29.77.

FAST FLIGHTS ON OSSINING HILL

Zengle the Star Performer Capturing the Free-for-All—Summer Girls in Easy Chairs Look On.

So far there have been at least two National days this year. One of them, as every one knows, was the Fourth of July, and the other one was the first of the same month. But whereas "the Fourth" was cele-

first place in the division closed to fully equipped touring cars owned and driven by members of the Upper Westchester Automobile Club.

To Len Zengle, however, really belongs the greatest glory of the day. He proved fastest in both the free-for-all and the class for cars of from 451 to 600 cubic inches piston displacement, his time in the former event being 33 $\frac{1}{4}$ seconds. His mount, too, was a National. Spencer Wishart, in a Mercedes, was the most dangerous rival

WANT SPEEDWAY THROWN OPEN

New Yorkers Take Steps to Restore \$6,000,000 Roadway to Public—Now Monopolized by Few Horsemen.

The Licensed Automobile Dealers of New York have given drivers of fast horses something to think about. The Dealers have started a movement to have the Harlem Speedway thrown open to the general public. This magnificent speedway extends along the Harlem river from One Hundred and Fifty-fifth street to Dykman street. It was built under an act of the Legislature of 1893 for the exclusive use of drivers of light, horse drawn carriages, and at a cost of some \$6,000,000. At that time the driving of fast horses was carried on extensively and automobiles were few and far between. Since then the trotting horse has become conspicuous by his absence and the automobile is very much in evidence. The result is, the Speedway is seldom used excepting Saturday afternoons and Sunday mornings by a few horse owners.

The Dealers feel that all automobile owners are being taxed for the upkeep of this magnificent roadway, which is under the direction of the Park Department, although they derive no benefit. They do not ask the City to turn the road over for speeding of automobiles. The object is to have it

SUMMER GIRLS, AND OTHERS AT OSSINING'S HILL CLIMB.

brated all over the United States, the first was celebrated as a National day principally in Ossining, N. Y., the habitat of the Upper Westchester Automobile Club. The cause for all the disturbance was the annual hill climb fathered by that organization, and the reason the cognomen National day is perfectly apt is that the pilots of National cars won four of the five events scheduled and it is not unlikely that they would have won the fifth if they had been eligible for the class.

Taken all in all it was a gala day for the Hudson River town. It was not necessary to let out the convicts in order to get a crowd—everybody, men women and children, turned out and lined the course from end to end. In fact, it was just a good excuse for a picnic and camp chairs and other kinds of chairs, and lunch boxes were the rule rather than the exception. The course was in excellent condition and everything went off with a degree of smoothness seldom exceeded.

Debonair Caleb Bragg, who up to that time had driven Fiat cars to the almost total exclusion of everything else, started the winning streak of the National contingent by capturing first honors in the class for cars of from 301 to 450 cubic inches piston displacement. Closely following Bragg's victory, Wilson, also at the wheel of a National, streaked up the incline for

LEN ZENGLE (NATIONAL) WINNING OSSINING FREE-FOR-ALL.

that Zengle had, but the best he could do was second place, and he got that in both the events.

Hughie Hughes, who had the mount on a Mercer, was the only outsider to get a look-in. His particular success was made in the class for cars of from 231 to 300 cubic inches piston displacement, which event he won quite handily.

opened to automobilists for pleasure purposes, the same as the drives now controlled by the Park Department.

The Dealers have appointed R. H. Johnston, of the White Co., and Harry Bronner, of the Stoddard Motor Car Co., to confer with the Park Board and the Road Drivers' Association for the purpose of ascertaining what can be done in the matter.

KNIGHT ENGINE FOR STEARNS CARS

Before Adopting It, Stearns Adds Some Original Ideas—What They Are and the Purposes Served.

In announcing its adoption of the Knight engine, to the entire exclusion of the poppet

latter being of the type that has been used on the smaller of the two previous models. The axle consists of a massive solid forging spread at the center to form an open trussed section, which embraces the transmission and differential casing. The axle is drilled out at either end to receive the driving shafts, the effect being the same

plant, which is the only novel feature of the new model, the design of the carburetter may be termed a revision of former Stearns practice. That is to say, it is of the double-jet type, and to that extent is similar to those which have been used on both the larger and smaller of previous models. One jet supplies fuel for low speeds, while the other jet comes into action to supply increased quantities of gas in exactly the same proportions.

A unique provision is that whereby the air supply is heated to a uniform temperature under all conditions. To ensure this desirable result, a continuous passage is cored out of the crank case, with the terminal of which the air intake to the carburetter is connected. The result is that in passing through the case and around the bearings, the air is heated, while the surfaces from which it draws the heat are correspondingly lowered in temperature. The result is that the crank case and bearing temperatures are maintained at a lower level than ordinarily, lubricating being correspondingly assisted.

As in other Knight engine products, oiling is carefully provided for, the success of the system depending on the proper oiling of the sleeves. To this end a combination of pressure feed and splash distribution is employed. A gear pump, placed in the rear of the crank case and at the bottom, draws a continuous supply of oil from the sump, which is fed through ducts to a series of open troughs, one of which is located beneath each of the cranks.

THE STEARNS-KNIGHT MOTOR, SHOWING ITS GENERAL CONSTRUCTION.

valve type of engine, The F. B. Stearns Co., Cleveland, Ohio, has let it be known that it has not taken the principle "on faith," but has made a painstaking study of its characteristics extending over two years. As a result of its investigations the Stearns-Knight engine possesses a number of original features, and actually differs from the Knight-Daimler engine, which is its best-known prototype, in several material points. These include the general design of the cylinder head, which is fitted for but one spark plug, instead of two; the proportions of the engine and the new, specially designed carburetter and the oiling system.

In proceeding to replace both the 15-30 and the 30-60 models which it formerly produced, the Stearns company has fixed on a type which is intermediate in size and which in several ways combines the characteristics of both. Having a bore and stroke of $4\frac{1}{4} \times 5\frac{1}{2}$ inches, respectively, the new motor takes an S. A. E. rating of 28.9 horsepower. Its actual development is considerably over that, however, the makers, indeed, guaranteeing a 50 per cent. overload capacity. The transmission system includes the multiple-disk, dry-plate clutch, which has been a Stearns feature for several years, and likewise embodies a three-speed selective change gear mounted on the rear axle, the

STEARNS-KNIGHT ENGINE PISTON AND VALVE GROUP COMPLETE

as that of the conventional live axle. With respect to the details of the power

Dippers on the connecting rod bearing caps scoop from these troughs at each revo-

lution small quantities of oil, which is forced through the bearings by the action of the scoops and afterwards thrown off by centrifugal force against the valve motion shaft and the interior of the inner sleeve. The piston is lubricated in this way, much in the ordinary fashion, the sweep of the piston also forcing the lubricant outward through a number of holes drilled in the lower part of the inner sleeve, whence it is carried upward between the inner and outer sleeves by means of a series of circumferential grooves. Holes drilled through the outer sleeve and a similar series of groove serve to carry the oil through to the cylinder wall and effect its distribution.

course moves in time with the engine, and so varies the air supply in proportion to the demand of the engine for gas, its only moving part is a check valve.

The new Stearns line, based on a single chassis, will comprise touring, runabout, roadster, landaulet and limousine mountings in a variety of color finishes. A special feature is to be made of the equipment, which will include in addition to such essentials as the tool and repair outfit, a silk mohair top with slip covers, windshield, quick detachable-demountable rims, Klaxon horn and a complete electric lighting outfit. This consists of a generator, headlights, tonneau and trouble lamps and combination oil and electric side and tail lamps.

position to insure regular firing. I put a small copper washer on the end of the armature shaft, taking up this play, and now the magneto works as well as ever."

New York's Licensed Dealers Reorganize.

In line with the action of similar bodies and following the reorganization of the Association of Licensed Automobile Manufacturers itself, as the result of the decision adverse to the Selden patent, the Licensed Automobile Dealers of the City of New York has been transformed into the Automobile Dealers' Association, Incorporated. The incorporation was effected under the laws of Connecticut and though the charter is a broad one, the chief

THE STEARNS-KNIGHT STANDARD TOURING CAR.

THE STEARNS-KNIGHT SMALL TONNEAU ROADSTER.

By a special arrangement the troughs above referred to can be moved slightly about a shaft at one side of the case in such a way as to alter the depth to which the dippers are plunged in the oil. This has the effect of altering the distribution and is an efficient provision for ensuring an ample oil supply for high-speed running.

One of the original features of the Stearns-Knight engine is the formation of the cylinder head, which is of unusual depth and fitted for but one set of spark plugs, instead of two, as more commonly is the case. This is rendered possible by the adoption of dual ignition. As a result of this an unusually large body of cooling water is carried around the combustion chamber, while ignition is made to occur in what is in effect a firing chamber immediately over the center of the combustion chamber. The cylinders are cast in pairs, and, of course, the exterior of the engine is absolutely "clean," the entire valve gear being contained within the crank case.

Rather a neat improvement over ordinary construction in respect to the fuel supply is the adoption of an air pump which replaces the ordinary check-valve. Thus, instead of cooled and filtered exhaust gas, the tank pressure is obtained by means of compressed air. The pump which is of the single-acting plunger type, is driven from a prolongation of one of the valve-sleeve connecting rods and is mounted horizontally on the left side of the crank case. Aside from the plunger, which of

The general specifications of the chassis include the wheel base of 121 inches for all models except the small tonneau and roadster, these types being of 116-inch base; tires 36 x 4½ inches, both front and rear, spring, semi-elliptic in front and three-quarter elliptic in the rear. The body designs, as the accompanying illustrations show, are of characteristic design. Both the touring and small tonneau types are built both with and without front fairs, according to the option of the purchaser. The price of the standard types is \$3,500. The landaulet and limousine types sell for \$4,850 and \$4,750, respectively, and the chassis alone for \$3,200.

Peculiar Misfiring Traced to Armature.

"My magneto had been giving me trouble for about 2,000 miles," recently remarked a motorist, "and for a long time I was at a loss to discover the reason for the misfiring, which was not confined to any particular cylinder, but which alternated between them all. Examination showed that the fiber of the distributor was cracked slightly, and thinking that possibly the crack might have become filled with carbon dust, thus short circuiting some of the leads, I had a new one fitted, but without effecting a cure. Finally I took the whole thing down, and in refitting it discovered that there was about one-sixteenth of an inch end play in the armature shaft. This affected the make and break mechanism to such an extent that it was impossible to set it for any intermediate

object of the organization will be to continue to serve the interests of the New York retail trade. The corporation will have no stock. The incorporators named are John F. Plummer, Charles P. Skinner, Frank Eveland, R. H. Johnston, Sidney B. Bowman, H. M. Bronner and M. J. Budlong.

Brush Runabout for Less than \$400.

The announcement late last week by the Brush Runabout Co. of a new model, the Liberty-Brush, at \$350, was one of the trade moves that had been so well guarded that not even an inkling of it had escaped in advance. The price, which scarcely two years ago would have been deemed impossible, naturally set the world by the ears. The new model differs in detail only from the Brush model E runabout which lists at \$450. It employs the same 10 horsepower motor and the same chassis. The crank case of the motor is, however, of cast iron, instead of aluminum; hub caps are of iron instead of brass; fenders are short instead of long, and the upholstery is of red imitation leather instead of the heavy black leather used on model E.

Reo Adds a Thousand-Dollar Model.

The Reo Motor Car Co., of Lansing, Mich., has added a \$1,000 model to its line. It is equipped with a 4 x 4½ inch four-cylinder, 30 horsepower motor, and other standard features and retains many characteristics of the current 4-30, \$1,250 model.

COLUMBIA WITH SLIDING VALVES

How Old Company Will Employ Knight Engine—Imported Castings Used—Features and Equipment of New Model.

Following its own initiative it is but natural that the Columbia Motor Car Co., of Hartford, Conn., should be among the first in this country to adopt the Knight engine. As the direct offspring of the pioneer Electric Vehicle Co., Columbia products are associated with a long history of innovation and primary achievement. In adopting the Knight engine, however, no element of unnecessary speculation has been per-

the Bosch system of double ignition. Complete water jackets surround the cylinders and heads, the cooled surfaces being so disposed that the walls and the bolted-on heads shall be maintained at a uniform temperature under all circumstances. The manner in which the cooling has been worked out is plainly indicated in the accompanying sectional view of the complete engine.

The picture also affords a good idea of the manner in which lubrication requirements are taken care of. The oil supply is pumped from a reservoir in the bottom of the crank case and automatically delivered to feed pipes, as in the familiar pump-over system. Instead of being delivered directly to the bearings, however, the oil is fed to

Distribution of oil to the pistons, cylinders and sleeves is an important feature of the system, which is carried out by drilling small holes through the inner and outer sleeves and turning a series of grooves in their respective exterior surfaces. The picture showing the engine components disassembled illustrates this feature very clearly. It also indicates the general formation of the cylinder units and affords a comparison between the crank and valve motion shafts, showing that the latter is a true crank shaft having a very short "throw." The short connecting rods that are employed in actuating the sleeves, which also are shown, indicate plainly the relatively short travel of the sleeves as compared with the piston.

VIEWS SHOWING ARRANGEMENT OF THE NEW COLUMBIA-KNIGHT ENGINE.

mitted to enter into account. The decision to adopt the sleeve valve engine was reached only after many months of patient experiment and study. The engine itself has been designed by the Columbia company's own engineering staff, in consultation with Knight himself. Not only this, but, recognizing the possible uncertainties of producing a radical design, as well as the advantages which arise from long experience in any given line of work, arrangements have been made for the importation from abroad of the cylinders, sleeves, pistons and rings.

The Columbia-Knight engine is of $4\frac{7}{8} \times 5\frac{1}{2}$ inch cylinder dimensions, its formula rating being 38 horsepower, although from 70 to 85 horsepower is said to be available as the maximum speed of the motor is approached. It is of four-cylinder construction, the cylinders being cast in pairs. Two spark plugs are fitted in the depressed cylinder heads, the standard equipment being

a series of troughs, one of which is placed under each crank, from which it is scooped up and distributed to the "big end" bearings of the connecting rods and through large bores in the crank shaft to the main bearings. The system, which closely resembles that which has been standardized for all Knight motors, has been designated by the Columbia company a "movable dam" system. Its important feature is that the troughs are mounted at one end only and on a shaft running from end to end of the motor, the shaft being subconnected to the throttle mechanism. As the throttle is opened or closed the troughs are raised or lowered, the depth to which the scoops dip into the troughs, and consequently the oil supply to the engine thus being regulated in accordance with the speed. All overflow from the troughs and drainage from the cylinders falls to the lower portion of the base through a screen which separates the upper and lower compartments.

The method of driving the valve gear by means of a silent chain, instead of a train of spur gears, is another characteristic of this type of engine. The magneto and pump drive likewise is by silent chain, motion for this purpose being taken from the rear end of the crank shaft, while the valve shaft is driven from the forward end.

While in many respects the new model Columbia car will follow the lines of its predecessors, the installation of the slide valve engine will not be its only novel feature. Being equipped, almost as a matter of course, with closed-front bodies, the control mechanism will be adapted to suit the convenience of the operator and also to provide means for entrance from either side. To this end the emergency brake and gear shifting levers are of short length and are mounted in the center of the foot board. As an option, the control lever set may be placed at the right of the foot board and arranged either inside or outside the body;

the central mounting is recommended, however. The change gear mechanism is of the four-speed, selective type, compactly built and so designed that both the driving and lay shafts are supported on both sides of the driving gears.

Contrary to former Columbia practice in respect to the mounting of the rear axle in the chassis, a special form of U-section pressed steel triangular torsion member has been adopted, which is tied to the upper and lower sides of the rear axle housing and is linked to the frame in front by means

and hooded landaulets also will be included in the line.

An improved poppet-valve type of motor also is being brought out which will be installed in a chassis corresponding closely to that of the sleeve-valve machine. The T-head motor is of 4 $\frac{7}{8}$ x 5 $\frac{1}{2}$ inch cylinder dimensions, therefore taking a nominal rating of 38 horsepower. This vehicle will be a continuation of the present mark 85 Columbia, with improvements in body construction and in certain mechanical details. The most important of these are the adop-

THE COLUMBIA-KNIGHT FIVE PASSENGER ROADSTER.

of a flexible connection. The original form of double combination radius and distance rods at the sides, of course, has been eliminated in favor of the somewhat more conventional arrangement.

The new Columbia rear axle is of the full floating type, the central housing being a malleable casting with the end tubes hot rivetted in place, but not brazed. Large sized brakes are mounted on the wheel hubs and are actuated by means of balance beams. The wheels are 36 inches in diameter, and the wheel base for the standard chassis is 129 inches.

Flush-sided bodies are to be produced in seven- and six-passenger touring types and also in close-coupled and two-passenger roadster forms. The six-passenger touring car, in particular, is noteworthy by reason of the fact that the extra seats are especially designed for the purpose and are arranged to fold into the floor, where they are practically out of sight when not in use. The two-passenger roadster is of the so-called gunboat type and carries a large capacity fuel tank and a protected touring trunk.

The new style Columbias will carry a very complete line of equipment including such essentials as tops and covers, quick-detachable-demountable rims, a power tire inflation pump, electric lights, magneto, ignition and lighting battery, shock absorbers, trunk rack and rear storage hamper, not to mention the usual outfit of tools and spare parts. Semi-enclosed limousines, with removable glass panels for the driver's seat, double limousines and straight-front

tion of a pure air pressure system for the gasoline feed, a raised carburetter and a motor-driven tire-inflation pump. The Columbia-Knight car with its full equipment,

COLUMBIA-KNIGHT ENGINE PARTS SHOWING STRUCTURAL DETAILS.

will sell for \$4,500, while the car which is to be fitted with the poppet-valve engine will list at \$3,500.

Emergency Substitute for Broken Spring.

Owing to the excellence of materials now available and to the experience of designers which permits of practically perfect proportioning, spring breakage is a comparatively rare occurrence. When springs do

break, however, the cause usually is a severe rebound rather than a too heavy load. Therefore, unless a car is equipped with shock absorbers, it is well to fit straps from the chassis frame to the axles to prevent excessive and unnecessary spring action. Even should a spring break it generally is possible to effect a temporary repair which will at least allow of the car being driven to the nearest repair shop, by jacking up the frame and placing a block of wood between it and the axle. The block should be roped or wired in position, and though the car naturally will ride hard it may be driven a considerable distance without danger of further damage if it is handled carefully. The remedy may be used with equal facility for either front or rear springs, though in the case of front springs greater care in making the block fast will be necessary, as the axle is likely to be pushed back out of place, when the steering control would be lost.

When Too Much Water Does Harm.

While too much water in a radiator undoubtedly is better than not enough, a very little too much often is the cause of unsightly brass work or stained paint. Water expands a certain amount when heated and if a radiator is filled up to the top of the filler cap, or nearly so, the water, expanding, is forced out around the cap and runs over the top of the radiator and the bonnet. Not infrequently the resultant sloppy condition is thought to be due to the water

boiling, whereas in the majority of cases it really is caused by too much water. If the water level is brought up so that the tops of the tubes are covered from an inch to an inch and one-half, the remaining space will be sufficient to allow for any expansion which may take place, and the appearance of the car in general will be enhanced by the absence of stained or dirty paint and tarnished brass.

Torsion Tubes and Radius Rods; Their Purposes

Properly handled, and with the engine running, an automobile will start when the clutch is "let in"; the energy generated by the motor will turn the propeller shaft, the change gear set will transmit the power to the wheels, either through the rear axle or by means of a chain or chains, the wheels will be rotated and the car will move. Similarly, the vehicle will stop when the clutch is disengaged and the brakes are applied. All of which is very simple on the face of it. A peep "behind the scenes," so to speak, reveals the fact that each component part of the transmission mechanism has one or more particular functions to perform, and that each is so designed and arranged that all work in harmony toward a common end. In other words, there is a certain definite relationship between the power plant, the chassis frame and the rear axle, and this relationship must be maintained.

In defining and establishing the bearing of these three parts upon each other there are three important influences, or, as the engineer would put it, three groups of forces, to be reckoned with. Primarily there is the load; it is obvious that the greater part of the weight of the vehicle must be supported by the rear axle. The second of the three groups of forces becomes apparent in the drive or tractive effort. Since all of the propulsive action is imparted to the vehicle through the rear wheels, it follows that upon the wheels and axle there must devolve a force, or set of forces, corresponding to the force that in a horse-drawn vehicle is communicated to the vehicle through the traces. In railway parlance, this force is styled the "draw-bar pull," an expression that has gained some use in the automobile industry.

The third of the influences which tend to disturb the relationship of these three parts of the automobile is torque. There is a law in mechanics to the effect that "every action has an equal and opposite reaction," which, stated negatively, is embraced in the trite old saying, "A man cannot lift himself by his boot straps." Expressed in even simpler language it might be said that it is impossible to push against an object unless one first braces himself against another body upon which there will be exerted an equal pressure in the opposite direction. Similarly, in a shaft-driven car, when the driving pinion exerts a pressure upon the driven gear, an equal pressure in the opposite direction is exerted upon the housing of the rear axle. Therefore the first tendency is for the smaller pinion to "climb" the larger gear; that is to say, to roll over it instead of causing it to turn.

The effect of such a movement would be to cause the housing to swing around the axle exactly as each of the spokes of a wheel rotates around the hub.

The torque thrust in a shaft-driven car is, of course, equal to the propulsive effort. Similarly, when the brakes are applied to bring the vehicle to a stop, there also is a reaction, though it is in the opposite direction to that which is exerted in the propulsion of the car. A similar influence must also be combatted in chain-driven cars, though owing to the manner in which the countershafts are mounted, no special mechanism is required to take care of the torque, the gearcase itself serving the desired purpose.

Considering the effects of these three groups of forces, the load bears downward on the axle through the springs, but varies as the road varies, because of the movement of the springs. The drive causes the axle to press forward under the chassis, and were it not opposed in some way it would slide forward out of its normal position. The torque causes the axle housing to tend to rotate about the axle proper in a direction opposite to that in which the prime force is exerted. In the mounting of an axle, these three groups of forces must be accounted for, each by a special means of connection. Not only this, but the axle must have freedom of movement under spring play, it must be rigid in respect to fore and aft movement under the chassis and also it must be maintained parallel to the front axle.

To prevent the tendency of the rear axle housing to rotate about the axle under the strain of propulsion or under the braking strain, torsion rods, or bars, are fitted. Radius rods, on the other hand, maintain the rear axle in its proper position parallel to the front axle and also take the drive. Their functions thus are widely different, and though it might appear that owing to their widely differing functions, it would be necessary that torsion rods and radius rods be separate and distinct parts, this is not the case. In a number of instances, the torsion rod is made in the form of a tube which encloses the propeller shaft and also acts as a radius rod in that it takes the drive.

The necessity for separate radius rods also is obviated in a number of cases by causing the rear springs themselves to perform the functions of the former. This, of course, entails that the front ends of the springs be rigidly attached to pins on the frame and not mounted on shackles, as is done when the torsion tube acts as a radius member or when separate radius

rods are fitted. When the spring drive is used, a representative method of attaching the springs, which is illustrative of Cole "30" practice, being shown in Fig. 8, a separate torsion rod or bar is necessary unless a torsion tube is used. The difference between radius rod drive and spring drive is shown clearly in Fig. 9, which shows a typical form of radius rod drive, the Winton.

While torsion rods invariably must be attached rigidly to the rear axle, the differential housing being most generally used for this purpose, they must also be flexibly attached to the chassis frame to permit of their moving so as to suit the movement of the springs. Various arrangements of joints are in use, but one of the most effective, and incidentally the one which is most used, is that in which the end of the rod is formed into a ball which is carried in double sockets, the sockets being held in position top and bottom by means of springs. Owing to the motion of the springs when the car is travelling over uneven road, it not infrequently happens that one of the springs is compressed to a greater extent than is the other. This produces a small amount of motion at the end of the rod, and also when both springs are equally compressed there is a certain amount of lateral movement. As the end of the rod is flexibly connected, it is permitted to move according to the movement of the springs and at the same time it is sufficiently rigid to take up the torque.

Theoretically, in order to allow of the same relative movement of both propeller shaft and torque rod, these two members should be made exactly the same length. In practice, however, the length of the torque rod frequently is approximated, merely for ease of manufacture, and the slight difference of movement, owing to the difference of length of the two, is provided for by making the joint to which the front end of the rod is attached a hinged member, hinging from the chassis frame. This is permissible because the torque rod never takes any part of the drive unless it is designed to do so, as in the case of some cars in which a torque tube enclosing the propeller shaft is used and in which separate radius rods are not employed.

In the case of chain-driven car, for instance, the tendency is for the chains to drag the rear wheels and axle directly forward toward the front axle. Exactly the same tendency exists in shaft-driven cars, owing to the traction of the wheels on the ground. If no means was provided to maintain the axle in its proper position, it would be forced forward and probably

1—Flanders Torsion Tube and Strut Rods. 2—Stearns Swivel-jointed Torsion Tube. 3—Ohio Spring Drive and Torsion Tube. 4—Hudson—Another Form of Spring Drive and Torsion Tube. 5—Matheson Separate Radius Rods. 6—Premier Spring Drive and Separate Torsion Rod. 7—Pullman Triangular Torsion Rod. 8—Cole Spring Connection. 9—Winton Radius Rod Drive. 10—Hupmobile combination Strut and Radius Rods.

would cause the propeller shaft to buckle, providing the springs and spring seats were not strong enough to withstand the drive. To relieve the springs and the propeller shaft of strain—in fact, to take all the drive—is the principal function of the radius rods.

Theoretically, the radius rods also should be the same length as the propeller shaft, for the same reason that the torque rod should be, viz., to allow of the same relative movement between them. When for any reason it is made shorter or longer than the propeller shaft it is necessary to place a slip joint in the shaft to allow for the difference of motion. When the rear springs are compressed the rear axle moves upward in the arc of a circle, the size of the circle being governed by the length of the radius rods—hence their name. As the axle cannot swing on more than one arc at a time and as the radius rods control the radius of the arc on which it does swing, then some provision for automatically shortening and lengthening the propeller shaft must be provided, and this is accomplished by using a slip joint in the shaft.

But even with torque rods, or bars, and radius rods thus defined—the torque rods being merely to take the torque and not the drive, and the radius rods taking the drive and governing the radius of the arc on which the rear axle swings—and their differences pointed out, each are in such varied forms that it often is difficult for the purely lay mind to differentiate between them. Even with the help of illustrations, the arrangement still may be confusing, as, for instance, the Flanders chassis which is illustrated in Fig. 1 in the accompanying plate.

In this case, neither radius rods nor a torsion rod is used, though the arrangement of the two rods designated S' and S" might lead to the suspicion that either one or the other was employed. As a matter of fact, both the drive and the torque are taken by the torque tube, T, which is arranged with a ball and socket joint, B, to allow of the tube moving both up and down and circumferentially, thus taking the place of the radius rods used on other cars. The two rods, S' and S", are merely struts which are used to maintain the relative positions of the axle and the torque tube, which moves from the center of the universal joint at U.

A very similar arrangement is shown in the Stearns chassis, which is illustrated in Fig. 2. It differs from the other, however, in that though the struts, S' and S", serve the same purpose and are in practically the same place, the torque tube, T, is carried out into a yoke, where it is joined to the cross member of the chassis frame, the joints being hinges in action. But as the tube is subject to a certain amount of circumferential movement when one of the rear springs is compressed more than the other, and as it would be liable to fracture

unless some means of allowing such movement was provided, a swivel joint is placed at W. In this design, as in the other, the torque tube performs double duty, so to speak—it takes both the torque and the drive.

Hupmobile construction, which is illustrated in Fig. 10, differs radically from both of the others, though a purely superficial glance at the illustration might lead to the supposition that it was practically the same. The rods, R' and R", are both strut and radius rods and perform the functions of both, which is to say that in addition to maintaining the relative positions of the axle and the torque tube, T, they also take the drive and control the radius of the arc in which the rear axle swings. They are hinged at a point exactly in line with the center of the universal joint at U, and as they are the same length as the propeller shaft a slip joint in this shaft is not necessary.

A torsion tube, T, also is used in the Matheson chassis, which is depicted in Fig. 5. The radius rods, R' and R", however, are entirely separate, and as may be seen, are placed one on each side of the chassis. In performing their function, which is to take the drive, they also serve to maintain relationship of the axle and the torsion tube. As they are the same length as the propeller shaft, hinging at the center of the universal joint at the front end of the shaft, a slip joint is not necessary.

Neither radius rods nor a torsion tube is used in the Pullman chassis, which is shown in Fig. 7, the torsion being taken by a regulation torsion rod or bar, and the drive being taken by the springs, the front ends of which are rigidly mounted on pins on the chassis frame. The torsion rod, T, is in reality two rods which are joined at the forward end and attached to a cross frame member by means of a ball and socket joint; one of the two rods is attached to the bottom of the differential housing, and the other is attached to the top. As the radial action of the axle is governed by the springs, and as the arc in which the axle swings is of a smaller circle than it would be if axle swung from the center of the front universal joint, it is apparent that a slip joint is necessary in the propeller shaft. It is provided at S.

Ohio construction, illustrated in Fig. 3, provides a torsion tube, T, but no radius rods, the drive being taken by the springs in a manner similar to that heretofore explained. The front end of the torsion tube is carried in a ball and socket joint at B, the necessary slip joint also being enclosed in the same casing. The Hudson arrangement, as shown in Fig. 4, is quite similar in that the drive is taken by the springs and the torsion by the torsion tube, T, though it differs in so far as the torsion tube is concerned; this is not mounted in a bearing on the chassis frame, but is carried at the front end in a bearing, B, on the propeller shaft itself.

Differing from all the others, the Premier arrangement, shown in Fig. 6, provides a torsion rod proper, T, rather than a torsion tube, though in it the spring drive is employed. As in the former cases, and, in fact, in all instances where spring drive is used, a slip joint in the propeller shaft is provided, this member being at S in this particular car. The front end of the torsion rod is mounted in the ball and socket joint, B, on a cross-frame member.

It has been said that "of the making of books there is no end," and with equal aptness the same saying, slightly paraphrased, would apply to the construction of automobiles, which is to say that the number of ways in which the component parts may be arranged is almost without limit. Though certain methods have become standard, always new methods are cropping up, some to supplant older ones, possibly only for a time, and others to be relegated to the junk heap almost before they have become realities. Nine times out of ten, however, the principle involved remains unchanged, and though it would require an infinite amount of time and labor faithfully to describe the workings of all, this seldom is necessary. If the fundamental principles are firmly grasped, the embryo student of automobile engineering, or the owner who is merely curious, or who desires through the medium of acquired knowledge to facilitate repair work or to obviate it as much as possible, need go little further—for instance, radius rods, whether they be separate or combined with the torsion tube or the springs, always take the drive and assist in the maintenance of the relationship of the propeller shaft and the rear axle, and torsion rods, bars or tubes take the torsion, in other words, cause the effort to be applied in the proper direction.

Tire Exports Near to Two Millions.

During the month of May last, \$310,346 worth of American made automobile tires were exported to foreign ports, and together with \$59,194 worth of tires of other classes, the shipments representing in the aggregate a gain of nearly \$100,000 as compared with April's shipments. For the 11 months ending with May, the total value of automobile tires exported was \$1,838,482, and of other tires it was \$538,407. Comparison with previous totals is impossible, as the separate listing of tires was not commenced until July, 1910.

Army Buys Trucks for Use in Manila.

The Philippines government, which about a year ago raised a mild storm about its ears by purchasing several made-in-Europe motor vehicles, has profited by that experience. It just has placed another order for trucks, which this time went to an American manufacturer, the White Co. The order calls for seven gasoline trucks, which will be employed by the Quartermaster's Department of the United States Army in Manila.

Perplexities of Reckoning Motor Truck Costs

Figuring on the cost of motor truck operation is just about as satisfactory a mathematical exercise as trying to determine—in advance—whether two can live cheaper than one. A great deal depends. The sale of aigrettes may be forbidden by law, but the price of millinery continues to advance in a measure beyond the foresight of the prospective and wistful bridegroom; similarly a stretch of rutty road, hitherto unmarked, may lie between the truck owner's loading platform and the depot that will set him back just about \$200 a year in tires and other upkeep expense. To make the comparison brief, there are a lot of little things that are apt to intrude when least expected and which it is difficult, if not impossible, to reckon on in advance.

Hence one of the difficulties that heretofore has intervened to check the sale of trucks. The interested or intending manufacturer or tradesman always wants to know, as he is pretty apt to put it, 'just about where he is "going to get off." The truthful salesman, however, has been—and still is—in the unhappy position of being able to inform him only where he is going to get on, so to speak. As to the cost of operation, he must introduce a bewildering number of "ifs" and "abouts." Nor is there immediate hope of the atmosphere being clarified. At the same time it is known on perfectly good and unquestionable authority that motor haulage is proving cheaper than horse haulage, when rightly applied—in many cases to a phenomenal degree. To reduce the advantage to terms of cents per mile, or cents per ton, or per package, or per load, or per anything else, at the present time seems impossible.

A ray of hope for the perplexed and inquisitive prospect that approaches the dimensions of a large and luminous beam is projected by one happy circumstance. That circumstance is that salesmen are wearying of dealing in uncertainties, that truck builders are beginning to tire of the importunities of puzzled salesmen; in fine, that the trade is beginning to take notice of the sad deficiencies of its selling equipment. Guarantees and maintenance contracts do not answer the purpose. Besides sometimes these instruments prove expensive.

Evidence that the study of the cost problem has begun in the right way is not lacking. At its meeting last week, members of the Motor Truck Club, of New York City, listened to a paper on the subject which was read by A. N. Bingham, sales manager of the truck department of the Hewitt Motor Co., of this city. Afterward the members aired their individual views

on the subject to some extent. The following evening, that is, Thursday, 29th ult., the Metropolitan section of the Society of Automobile Engineers had the same general topic under informal discussion. From the latter circumstance it is not impossible to conjecture that ultimately, when sufficient interest has been aroused and a proper willingness to co-operate expressed, the S. A. E. itself may find means to bring its hard-working standards committee to develop a system of motor truck cost keeping.

All along the line it appears that this is the chief cause of uncertainty, and the real reason for the dearth of reliable information concerning the cost of working commercial vehicle equipment, that no two men are agreed in every respect as to the most suitable way of reckoning. Practically all the elements of uncertainty are recognized, but different authorities are inclined to regard them in different lights or to place different values on them. So it is quite as much a uniform method of attacking the cost problem as an exact knowledge of costs that is required just now. Cost figures may be obtained in abundance, even at the present time, but they cannot be relied on to mean the same thing.

The amount of the story is that there are too many variables entering into the cost problem to render it an easy one of solution. Road surfaces vary in different localities, and in the same localities under different weather conditions, grade conditions vary, speeds under load and without load are widely variant, loading conditions with reference to the nominal capacity of the vehicle differ according to local circumstances, the mileage per day is an unstable quantity in different installations, as is the relation between the distances travelled under load and empty, and the relation between useful and idle periods, or, in other words, the ratio of operating times to idle times.

Other factors that are far from standard are manipulation, that is to say, the relative judgment, skill and ability of the driver, the condition of the vehicle, with respect to adjustment and repairs, repairs, which depend on the durability of the machine, the conditions under which it is used and the balance between replacements and re-fitting requiring a considerable amount of hand work. Wages, fuel, oil and supplies costs and garage rentals or the corresponding fixed charges, likewise are subject to territorial differences, though fairly stable for any given locality. Garage charges, however, depend on the number of machines to be housed, as well as on the demands of the operator's business in other

respects. Thus, by way of illustration, if, for purposes of economy, the equipment is garaged at some distance from its normal working zone, the actual running costs involved in taking the rolling stock to and from work should become a part of the garage expense.

Apart from all these considerations, the first cost of machines of different makes is variable, that is to say, the cost per unit of carrying capacity. Hence, interest charges are not standard, and depreciation, which is practically a summation of all the foregoing particulars lumped in terms of a percentage unit, is no less uncertain than any of its components. Furthermore, it may be added by way of conclusion, that a considerable number of these variables are active, where several machines of the same make are at work in the service of the same operator, and several of them during different periods in the operation of any given machine. How then, is it possible to arrive at even a fairly representative average figure for expressing the cost of motor vehicle haulage? Or, to take it another way around: When it is stated that a certain truck that has been in use for six months has worked out an operating cost of 13 cents per ton-mile, exactly what does that mean?

About a year ago the unsuspecting public was regaled with a series of ton-mile figures representing the outcome of several motor truck "endurance contests." In one instance a truck entered in the one-half to three-ton class was credited with a ton-mile cost of 68 cents, in another instance a five-ton truck only cost a mere matter of 88 cents per ton-mile. Nor was the public enlightened as to the fact that while, as it was possible to discover by close reading, these figures represented only fuel and oil costs under certain stated conditions, the actual running of an average machine involved a great many items of expense which were not accounted for in the "records" of 68 and 88 cents, respectively.

Apropos of which it is related of one man whose name is almost a watchword in the trade, that when the last show season approached he decided it was about time to afford the public a few real facts in respect to the operation of trucks. Calling to him a sales engineer in his employ, he bade him gather all the figures he had in hand concerning the operation of the trucks which he produced, and after editing them carefully, to prepare a detailed statement of what it really ought to cost to run a really good truck under really favorable conditions. As he commanded, so it was

done, and in due process of time the new catalog appeared embellished with a page devoted to cost figures, figures that were a credit to the maker and to the industry, it may be added, without fear of contradiction.

Some of the beautiful new pamphlets were taken to the show and distributed among the stands, others were placed ready to the hand of the inquiring visitor and the plunder bag of the chronic catalog fiend. Then, suddenly, arose a great clamor in the camp of the manufacturer in question. Hurry calls were sent out for the engineer, for salesmen of his staff and for all the minions of the large organization. Spake the voice of authority, albeit in accents hushed:

"Send after every one of those catalogs! Get back every one you can and set a few boys to work tearing out that leaf with the cost figures on it. Have you seen the other makers' catalogs? Well, they've all got cost figures in 'em, and it's a cinch if anybody got hold of our book after seeing one of theirs we'd never, never sell a single car."

"If you ask me how much it costs per cab-mile to run a string of taxicabs, I will answer, 'I don't know,'" was the remark of Wm. H. Palmer, Jr., when asked to express some of his ideas on the cost question at the engineers' meeting last week. Palmer, who is secretary of the New York Transportation Co., is a mild-mannered young man of a decidedly analytical turn of mind. Besides, he has had a great deal of experience in solving the practical problems of motor cab operation both in New York and elsewhere. Cab operation, be it added, is, as he was not slow to explain, nothing more nor less than commercial vehicle operation applied to a specific class of vehicle. Cab operators are inclined to think theirs is the most difficult class of commercial vehicle to handle profitably. Motor truck men, on the other hand, are firm in their stand that it is about as easy as anything imaginable. Those who do not wish to stand in judgment between them are at least willing to concede that the cabman and the truckman are engaged in parallel pursuits.

"I don't know how much it costs to operate a string of taxicabs, if you ask me just that and nothing more," said the secretary of the Transportation company. "In return I shall be forced to ask how many cabs you have in mind, how many miles a day they run, how many passengers they carry, what your rates are, how many hours each cab is in service and what proportion of its mileage is useful mileage. When you have answered those questions, and not until you have answered each and every one of them, will I be in a position to begin to give you an idea of how much your operating cost should be. Taxicab accounting is as complicated as railroad accounting, only more so. You have practically all the elements to contend with that you encounter in railroad work and several others besides. In order to get at the operating cost,

it is necessary to separate each individual item and classify it by itself. Not until you are able to do that can you arrive at an intelligent idea of what it really costs to run a commercial vehicle."

Another point brought out by the same authority is that the requirements of motor vehicle accounting are peculiar to the industry. "If you put the matter in the hands of a professional accountant or cost expert," said he, "he will find out all about your service, but he may not be able to tell you just what you want to know. He may be able to discover what it actually is costing to run your equipment, but at the same time he may not be able to tell you where your cost is higher than it should be and why, nor whether you are getting the best possible results out of the machines you are using, whether your equipment is as well suited as some other might be."

"I remember the case of a manufacturer in this city who invested in a truck of well-known make a year or two ago, and who, by careful overseeing succeeded in keeping it in excellent condition and in running it economically," contributed another speaker. "And yet he found the truck service was costing him more than it had cost with horses. Although the truck was being given every possible advantage, and in cost figures seemed to show an advantage, it was not suitable for his work for the reason that he happened to be the manufacturer of a certain very light commodity that required very careful packing and formed an exceedingly bulky load. He was losing so much time in loading, that in the end he was forced to abandon the motor truck. He is now having his hauling done under contract by horses."

Enough has been said to show that no matter where the cost problem is attacked it fairly bristles with difficulties and that no matter in which direction a start is made, the seeker after knowledge is likely to arrive at the starting point sooner or later. Perhaps the item of depreciation is one concerning which more difference of opinion exists than any other and on which it is possible to hinge more than one heated argument by way of mid-summer pastime.

As it generally is viewed, depreciation is a method of expressing the ageing of the vehicle, its general deterioration under use. Concretely expressed, depreciation has come to mean a certain percentage of the cost of the machine which is charged against it each year, on the assumption that at the end of a stated period the depreciation fund will have grown to equal the original cost, thereby defraying the cost of a new machine or serving to perpetuate that one, according to the fancy of the individual owner. The term thus is being confused more or less with what, in the language of the street—not the abiding place of "the man in the street" but the home of high finance—is known as amortization. Depreciation thus is frequently held to be

a definition of the life of the truck. If the probable life is regarded as three years, 33⅓ per cent. of its first cost is "written off" or charged against the machine each year, and a suitable proportion of that figure enters into the "overhead" expense in figuring its cost of operation per mile or per ton or per whatever happens to be the fancy of the accountant. In this way the truck may be said to pay for itself in the given period.

As to just what the length of that period should be, however, authorities differ. Of course, no harm is done if too high a figure is taken. The only difficulty is that in that case the operating expense will become unfairly high. As far as the accounts of the individual machine are concerned, there will be no difficulty. Some commercial vehicle men would assess the life of their trucks at three, some at five, some at ten or fifteen years.

"To my way of thinking, the idea of basing depreciation on the life of the vehicle is all wrong," remarked Wm. P. Kennedy, chairman of the engineers' meeting. "If you say the life of a truck is going to be three, or five, or seven years, you take no account of the fact that some machines are run almost wholly in summer, that others run practically all the time, year in and year out, that still others are run intermittently. A better way of getting at it is to base the depreciation on mileage."

But here again is room for question. Shall mileage be taken to mean mileage under load—the real service of the truck? Shall it mean total mileage? or shall an allowance be made for idle mileage, taking into account the ratio between dead and live running?

Supposing one machine carries its average load the whole length of its normal haul, while another may be used for store delivery work and drops its load a few pounds at a time until it is empty. What shall be the distinction in mileage between two such vehicles, supposing them to be compared with depreciation in mind? Again, "authorities differ." The tire men, however, who have troubles of their own, are accustomed to call miles, just miles. "It is not scientific," as someone explains, "but it is the best that can be done."

A foreign truck expert who, since his arrival in this country, has gained considerable newspaper publicity, is of the opinion that mileage, straight mileage, is the proper basis, and that the maximum mileage life of a batch of trucks of a particular make should be the starting point. With 150,000 to 200,000 miles of service to the credit of certain trucks which this expert has in mind, his conscience enables him to bring the depreciation down to between 2½ and 3 cents a mile. One of the better known American makers, it developed at the engineers' meeting, is pursuing the same general plan. Chairman Kennedy's ideas of the subject carried him further than thus far has appeared.

"The truck is a composite structure," he said in so many words, "and the art has not yet reached a point where all its parts are of equal life. Therefore the actual depreciation of the vehicle is measured by the depreciation of its elements; as these are replaced as fast as they wear out or give out, the true way of getting at the real figure is to consider each part individually and assign to each a normal life. The truck can be divided into groups of parts as active and inactive, so to speak. Certain of the latter, a well-made frame, a good wheel, an engine base or a spring that is of the right proportions, may last almost indefinitely, barring accident. Bearing surfaces, on the other hand, and those that are subjected to abnormal strains, do not last as long. When you treat the problem in this way you find that the life of the vehicle is prolonged and that as far as depreciation in real usefulness is concerned, no sort of actual decay can be discovered."

"Depreciation is really a matter of obsolescence," said W. H. Palmer, previously quoted. "If you go on replacing wearing parts as fast as they become inefficient, your vehicle as a whole will remain as efficient at the end of three years as at the end of six months; it will continue to remain so until a time comes when you want to replace it with something better and more modern. Therefore the real depreciation of the machine is measured by its antiquity."

Still the fact remains that by getting down to mileage as more exact than the mere time element, no measure of actual load-bearing service is taken; but supposing someone were to devise a way of accounting for the actual wear in terms of, say, load carried, there still would be the uncertainties of the highway to cause divergencies from average results.

The entire difficulty of proper motor vehicle accounting is admitted to center about the details of maintenance, that is, of the elements that are governed directly by the service—the variables in any given case or any group of cases. To arrive at the real cost of truck operation, this difficulty must be surmounted by long, patient attention to the many details that enter into account, and a uniform system of recording cost data must be devised and introduced. Then, and then only, can the salesman tell the prospective customer what it really ought to cost him to run a truck in his line of business.

Even then, the salesman will not be able to tell the "prospect" how much he can save by using trucks. And for a very good reason. The "prospect" probably will have no idea what his horse haulage is costing him. Horse owners never do know.

One truck expert, anxious to increase his fund of information, sent out a special inquiry blank to 300 horse users, requesting particulars of their haulage problem. But three of the 300 forwarded replies from

which an intelligent idea of what horse haulage was costing could be obtained. Another truck engineer, obtaining a copy of one of the former's circulars, approved of it, and stole it for his own purposes—at least he says he did—adding thereto certain further inquiries of his own. Of the one thousand circulars sent out in revised form, a good share of returns came back. But not one on which was noted a single answer that would shed any light on the welfare of the horse.

Carburettors of Heroic Proportions. —

Many motorists familiar only with the compact little carburetter which renders

STROMBERG JUMBO CARBURETTER.

them good service, scarce can conceive a similar instrument nearly five feet high. Mention of it suggests a "freak" or freakish purposes, but that such carburetters actually are in practical use is attested by the accompanying illustration of a Stromberg carburetter, which is nearly five feet tall and which drives an eight-cylinder "V" shape 8 x 10 valve-in-the-head motor operated at about 600 R.P.M. and delivering 125 K.W. Twelve of these immense carburetters have been built by the Stromberg Motor Devices Co., of Chicago, for the Chicago General Electric Co. They are the first installment of an order for 300, which are to be used on electric-driven self-propelled interurban cars.

Slow Growth of the German Truck.

According to statistics recently issued,

Germany produced only 636 freight automobiles during the year 1909. Of this number 162 were of the one ton class, 130 of the three ton class and 344 of more than three tons. The increase over 1908 was 221 trucks. In that year, of those built, 112 were of the one ton class, 78 of the three ton class and 228 over three tons, making a total of 415, which was 19 more than the product of 1907.

Moving Pictures to Test Drivers' Fitness.

Hereafter all applicants for license to drive motor vehicles in England will have to undergo a medical examination. A notice to this effect has been served on all the proprietors of mechanically driven public service vehicles. The movement was brought about by the Assistant Commissioner of Police of London, who is determined that no driver will be licensed who has not passed a rigid examination. The tests will be made in a specially prepared room. Among other things, an automobile will be raised from the floor, in such a manner that the wheels can be propelled, at various speeds, without moving the car. In front of the driver moving pictures will be thrown upon a screen representing conditions that may arise during a trip. The room will be dark, but the steering wheel and levers will be so illuminated that the examining physician can see what the driver would do in event certain things happened. Although the applicant realizes the automobile is stationary he knows every move of his will be noted, and therefore has to be watchful. Such scenes as a child crossing the path of the automobile, and others calculated to make the driver nervous, will be displayed.

"Mercer Magic" Told in Print.

The performance of the two Mercer raceabouts in the 500 miles International Sweepstakes on the Indianapolis Speedway on Decoration Day has been made the subject of a little pamphlet by the Mercer Automobile Co., of Trenton, N. J., entitled "Mercer Magic." It frankly admits that the cars were entered in the big race without expectations of winning, but "to show the public that it was not necessary to build special cars with tremendous motors which are of no commercial use, in order to go the distance and still stay with the big fellows." This the Mercers did—to the tune of 67 miles per hour, though they had a piston displacement of only 300 cubic inches.

Where Automobile Thieves Are in Clover.

According to the Chicago police records, forty-nine automobiles were stolen in that city during the month of June. They were valued at over \$125,000. Few of them have been recovered. The new automobile law, which went into effect July 1, and which inflicts heavy punishment for such thefts, it is thought, will have a tendency to decrease the crime.

MINNESOTA MOST NOTABLE TOUR

Failure of Glidden Contest Adds Importance to Northwestern Event—Rich Prizes and Splendid Arrangements.

Bearing the distinction of being the only reliability run to boast the attendance of a special train of Pullman cars for the accommodation of contestants and others who may swell the procession without participating, the third annual reliability contest of the Minnesota State Automobile Association, to be held July 20 to 28, inclusive, and otherwise known as the Twin City to Helena Tour, gives promise of being "the" reliability run of the year, since the indefinite postponement of the Glidden Tour. Already 28 entries have been filed—eight of them are non-contestants—and the promoters are sanguine of at least 50 before the start is made.

The special train which will accompany the tourists, or rather which will just precede them, getting into all noon and night controls ahead of them, will be practically a hotel on wheels, meals and berths being provided at a nominal sum for all who desire them. In addition it will carry a special automobile repair car, and provision has been made for the carrying of spare tires and other luggage with which reliability tourists generally are deluged. For those who do not care to make the return journey by automobile, arrangements have been made whereby cars may be shipped back to the starting point at a reduced rate. That the trip will be a strenuous one is evidenced by the fact that the pathfinders were forced to give up before they had completed their labors.

Three states in all will be entered during the 1,285 miles run, and the natives of practically every town or city to be visited are prepared to enliven the program with various diversions, ranging from fishing trips to balls. All day Sunday, 23d inst., will be spent at Devil's Lake, N. D., where motor boating and other special features will be inaugurated.

The run is designated as a third grade reliability contest, according to the rules of the American Automobile Association, which is to say that penalties will be imposed for time and actual road work only, preliminary and final technical examinations being omitted. The longest single day's run is 210 miles, between Malta and Great Falls, Montana, and the shortest, which, incidentally, is the last, from Great Falls to Helena, Montana, is 110 miles. Unusually rich trophies are up for competition, their aggregate value being upward of \$3,000. Four of the trophies, the Special Helena trophy for the driver who makes the greatest mileage and stays in Montana the longest, the Despatch trophy

club prize, the Minneapolis Journal trophy first prize, the Reuben Warner, Jr., trophy second prize, and the James Gregg trophy third prize, will be awarded to the drivers, and in addition there are a number of trophies to be awarded to the counties and states in which the motorists encounter the best roads. As an additional incentive, all the winning drivers will be presented with gold medals. Naturally the first prize, which is offered by the Minneapolis Jour-

MINNEAPOLIS JOURNAL'S MINNESOTA TROPHY.

nal, is the bone of contention; it was designed and executed by Reed & Barton, of New York, and as the accompanying illustration suggests, is a fit compeer of the Glidden trophy itself.

North Dakota Forms State Association.

Automobile owners of North Dakota met in Fargo, N. D., last week and formed the North Dakota Automobile Association, with the following officers: President, W. J. Price, Fargo; vice-president, Dr. T. O'Brien, Wahpeton; secretary-treasurer, Seth D. Richardson, Fargo; directors—Hector Barnes, Fargo; F. D. King, Coopers-town; A. G. Divet, Wahpeton. The association will affiliate with the American Automobile Association.

Sprague Elected to Lead Omahas.

At the annual meeting of the Omaha Automobile Club of Omaha, Neb., the following officers were elected for the ensuing year: President, E. H. Sprague; first vice president, W. R. McKeen; second vice president, Gould Dietz; secretary and treasurer, L. C. Nash; directors, Ed George, Rome Miller, Frank Furay, S. A. Searle and Dr. Lord.

CONNECTICUT'S DOOR OPENED WIDE

Removes All Limitations from Non-Residents—Speed Limits Unchanged—New Requirements for Dealers.

Despite reports telegraphed and printed throughout the country, when the Governor signed the new automobile bill last month, to the effect that Connecticut had abolished all speed limits, the Nutmeg State has done nothing of the sort. As previously was the case, speeds in excess of 25 miles an hour anywhere, or 10 miles when the view is obstructed in cities or towns, or three miles an hour when passing a halted street car, will constitute prima facie evidence of unreasonable and improper speed.

The changes made by the law, most of which do not become effective until January, 1912, are not of a radical nature and aim chiefly to correct certain internal evils, as, for instance, the abuse of the use of dealers' number plates; the section dealing with revocation and suspension of licenses has been greatly amplified. So far as non-residents are concerned, the new law is more liberal than the old one. The latter gives them but 10 days' leeway; the new one removes even that limit, and it is in no way hedged by definitions of reciprocity. In other words, Connecticut's door will be open to all comers and without charge.

This feature of the law goes into effect on August 1 next, as does the revised scale of fees, which fixes a charge for commercial vehicles on a carrying capacity basis and places pleasure cars of all horsepowers on the same plane, viz., 50 cents per horsepower; previously, those of more than 25 horsepower paid 60 cents.

Among the more important provisions is one raising the driver's age limit from 16 to 18 years; another requiring dealers to file annually their certificates of appointment by the manufacturers whom they represent, and also, twice each year, reports of their sales; and still another requiring garage keepers to keep a record of all "transients" and the operators of such vehicles—other than owners—to sign such records and to register the times of their arrival and departure.

The full text of the law is as follows:

Definitions.

Sec. 1. Terms used in this chapter shall be construed as follows, unless other meaning is clearly apparent from the language or context, or unless such construction is inconsistent with the manifest intention of the legislature: "Commercial motor vehicles" shall include all motor vehicles designed or used solely for the transportation of merchandise or freight and all motor vehicles designed and used as omnibuses for the transportation of passengers on the payment of individual fares. "Dealer" shall include every person who is actively engaged in the business of buying, selling, or exchanging motor vehicles and who has an established place of business. "Intersecting highway" shall mean any highway which joins another at an angle, whether or not

it crosses the other. "Liveryman" shall include every person who, whether engaged in buying, selling, or exchanging motor vehicles or not, maintains for hire one or more motor vehicles. "Motor cycle" shall mean a motor vehicle having but two wheels in contact with the ground. "Motor vehicles" when used in this act, except when otherwise expressly provided, shall include all vehicles propelled by any power other than muscular, except road rollers, street sprinklers, fire engines and fire department apparatus, police patrol wagons, ambulances, and such vehicles as run only upon rails or tracks. "Non-resident" shall apply to any resident of another state or country who has no regular place of abode or business in this state for a longer period than one month in the calendar year. "Number plate" shall mean the sign or marker furnished by the secretary on which is displayed the register number assigned to such motor vehicle by said secretary. "Operator" shall mean any person who operates a motor vehicle. "Person" shall include any corporation, association, copartnership, company, firm, or other aggregation of individuals which owns or controls any motor vehicle as owner, or for the purpose of sale, or for renting as agent, salesman, or otherwise. "Police officer" or "officer" shall include any constable or other official authorized to make arrests or to serve process, provided he is in uniform or displays his badge of office. "Register number" shall apply to the number or mark assigned by said secretary to a motor vehicle, whether or not such number or mark includes a letter or letters. "Secretary" shall include the secretary of the state and the deputy or acting deputy secretary of the state.

Registration of Motor Vehicles.

Sec. 2. Every owner of one or more motor vehicles shall file annually in the office of the secretary, on a blank furnished by said secretary: (a) a statement of his name, residence, and postoffice address; (b) a description of each motor vehicle owned or controlled by him, including the name of the maker, the number, if any, affixed by the maker, in the case of a commercial motor vehicle the carrying capacity advertised for said vehicle by the maker thereof, the character of the motor power, the amount of such motor power stated in figures of horse power, such horse power, in the case of internal combustion engines, to be determined in accordance with the formula adopted by the Association of Licensed Automobile Manufacturers, and in the case of steam and electric motor vehicles the amount of such horse power to be taken as advertised by the maker thereof, and for such motor vehicles as have two ratings of horse power the registration to be based upon the higher rating; (c) such other information as shall be required by said secretary. Said secretary shall then register such motor vehicle, if such owner is, under the provisions of this act, a proper person to receive a certificate of registration, shall assign to such motor vehicle a distinguishing number or mark, and shall thereupon issue to the owner thereof a certificate of registration which shall contain the name, place of residence, and post-office address of the owner, and the number or mark assigned to such motor vehicle, and shall be in such form and contain such further information as said secretary may determine; and such certificate shall at all times be carried upon such motor vehicle and shall be subject to examination upon demand by any proper officer. An applicant for the registration of a motor vehicle who does not file his application therefor until after the last day of March in any year shall be entitled to a pro-rata reduction in the fee for such registration calculated to the first day of the month in which application is made. Upon the transfer of ownership of any vehicle its registration shall expire, and the person in whose name such vehicle is registered shall return, forthwith, the certificate of registration to the secretary, with a written notice containing the date of such transfer of ownership, and the name, place of residence, and post-office address of the new owner. A person who transfers to another the ownership of a registered motor vehicle owned by him, upon the filing of a new application and upon the payment of the proper fee, may have registered in his name another motor vehicle for the remainder of the

calendar year, provided the horse power of such other motor vehicle is the same or less than that of the motor vehicle registered by him the certificate of which has been surrendered; but if the horse power of such other motor vehicle is greater than that of the motor vehicle the certificate of which has been surrendered, the applicant shall pay, in addition to said fee, the difference between the fee paid by him for the surrendered certificate and the fee for the registration of the motor vehicle of the higher horse power. The certificates provided for in this section and in section three shall continue in force until midnight on the thirty-first day of December of the year in which issued.

Sec. 3. Every dealer in or manufacturer of motor vehicles may, instead of registering each motor vehicle owned by him, make application to said secretary for a general distinguishing number or mark, and the secretary may, if satisfied as to the facts stated in said application, issue to the applicant a certificate of registration containing the name, place of residence, and business address of the applicant, and the general distinguishing number or mark assigned to him and made in such form and containing such further information as said secretary may determine, and every motor vehicle owned by such manufacturer which is used for the purpose of testing or demonstrating, and every motor vehicle owned by a dealer, shall be regarded as registered under, and have assigned to it, such distinguishing number or mark. Manufacturers and dealers shall not be required to carry such certificates upon the vehicles registered under the provisions of this section, but every person operating a motor vehicle registered under the provisions of this section by a manufacturer or dealer shall display on such vehicle, in such manner as said secretary may prescribe, the operator's license number assigned to such person. Every dealer in motor vehicles shall, at the time of making his application, file with the secretary a certificate of his appointment as agent or sub-agent by the manufacturer represented by him, and he shall, semi-annually, on the first day of January and July, file with the secretary a statement, under oath, of the number of motor vehicles transferred to him and by him since the last preceding statement; and every dealer in motor cycles shall, annually, on the first day of January, file a similar statement of transfers made to and by him. Every liveryman may, instead of registering, under section two hereof, each motor vehicle owned by him, make application to said secretary, on a blank furnished by said secretary, for a liveryman's license and shall state therein his name, place of residence, postoffice address, and give a description of each motor vehicle owned by him which is kept for hire, including the same information as is required under section two hereof, and such further information as said secretary may determine. Said secretary shall then register each motor vehicle kept by said liveryman for hire, if such applicant is, under the provisions of this act, a proper person to receive such certificate of registration, shall assign to each such motor vehicle a distinguishing number or mark, and shall thereupon issue to the owner thereof a certificate of registration which shall contain the name, place of residence, and post-office address of the owner, and the number or mark assigned to such motor vehicle, and shall be in such form and contain such further information as said secretary may determine; and such certificate shall at all times be carried upon such motor vehicle and shall be subject to examination upon demand by any proper officer.

Number Plates.

Sec. 4. Every motor vehicle shall, at all times while in use or operation upon the public highways of this state, have displayed in a conspicuous place, at the front and rear, the register number plates or markers furnished by the secretary. Said plates shall be of a distinctly different color each year and shall be in such form as said secretary may determine; shall bear the initial letter of the state; the figures of the register number thereon, except on motor cycle number plates, shall be not less than four inches high, and each stroke not less than five-eighths of an inch wide, and each digit thereof shall occupy a space not less than three and one-half

inches in width. The figures of the register number on motor cycle number plates shall be two and half inches high, each stroke three-eighths of an inch wide, and each digit shall occupy a space not less than two inches in width. Said secretary shall furnish, annually, without charge, one pair of number plates for each individually registered motor vehicle, one pair for each motor vehicle registered by a liveryman, and six pairs for each registered manufacturer or dealer, upon application therefor. Such number plates, upon such motor vehicles, shall, at all times be entirely unobscured, and the register number and letters thereon shall, at all times, be plainly legible. Said number plates shall be horizontal, and shall be so fastened as not to swing; the lower edges thereof shall be at least eighteen inches from the ground, and, during the times when a motor vehicle is required to display lights, the rear register number shall be so illuminated as to be legible at a distance of sixty feet. Not more than one set of number plates and one operator's license number plate shall be displayed on any motor vehicle in operation upon the public highways of this state. If any number plate supplied by the secretary is lost, or if the register number thereon becomes illegible, the owner or person in control of the motor vehicle for which such number plate was furnished shall immediately place a temporary number plate, bearing his register number, upon such motor vehicle; provided, that such temporary number plate and the register number thereon shall conform to the regular number plate and be displayed as nearly as possible as herein provided for said regular number plate; and said person shall, within twenty-four hours after such loss or mutilation of his number plate, as aforesaid, give notice thereof to the secretary and apply for a new number plate, and thereupon said secretary shall supply a new number plate upon the payment of the fee therefor, as hereinafter provided. In the event that said secretary is unable to furnish immediately to any person entitled thereto any plate or marker provided for by this section, he may issue a certificate to such person stating that such marker has been ordered and giving the number thereof.

Operator's License.

Sec. 5. No person shall operate a motor vehicle upon the public highways of this state until he shall have obtained from the secretary a license for that purpose, but no such license shall be issued until said secretary is satisfied that the applicant is over eighteen years of age and is a proper person to receive it. If any applicant for such license possesses any physical defect which might affect the operation by him of a motor vehicle, the secretary may require such applicant to show cause why a license should be granted him, and may require such applicant to demonstrate personally that, notwithstanding such defect, he is a proper person to operate a motor vehicle, and if the secretary be satisfied of the ability of such applicant, he may issue to him a license containing such limitations as to the vehicle to be operated under such license as the secretary shall deem advisable. Nothing herein contained shall prevent the operating of a motor vehicle by an unlicensed person sixteen years of age or more, other than a person whose application has been denied or whose license has been suspended or revoked, if accompanied by a licensed operator, which licensed operator shall be personally liable for any violation of the provisions of this act. Applications for licenses shall be made upon blanks furnished by said secretary, and such application blanks shall be in such form and contain such provisions, not inconsistent with this act, as said secretary may determine. A number shall be assigned to each license, and a proper record of all applications for licenses and licenses issued shall be kept by said secretary at his office, and shall be open to public inspection. Each license shall state the name, place of residence, and post-office address of the licensee and the number assigned to him, and such facts and provisions, not inconsistent with this act, as said secretary may determine. Every person licensed to operate motor vehicles as aforesaid shall, upon the receipt of his said license, endorse his signature on the back thereof, in a space provided for the purpose, and such license shall not be

valid until so endorsed. Said licenses shall expire at midnight on the last day of February in each year. Such license shall, at all times, be carried by the licensee when he is operating a motor vehicle upon the highways of this state, and shall be subject to examination upon demand by any proper officer.

Sec. 6. Any certificate or license for any operator which is issued by said secretary upon an application or statement which is untrue as to any material matter shall be void from the date of its issuance, and said motor vehicle operator shall be deemed to be unlicensed.

Motor Vehicle Equipment.

Sec. 7. Every motor vehicle of more than ten horse power, while in use upon the public highways of this state, shall be provided with at least two brakes, powerful in action, and separated from each other, of which one brake shall act directly on the driving wheels or on parts of the mechanism which are rigidly connected with said wheels. One of the two brakes shall be so arranged as to be operated with the feet. On any motor vehicle not exceeding ten horse power one brake shall be deemed to be sufficient. Every motor cycle shall be provided with at least one brake, which brake may be operated by hand. Every motor vehicle so operated shall be provided with a suitable bell or horn, and every motor vehicle, except a motor cycle, shall, during the period from one-half hour after sunset to one-half hour before sunrise, display at least two white lights on the forward part of said vehicle, and every motor cycle so operated shall be provided with at least one white light, which light or lights shall be visible not less than two hundred feet in the direction in which said vehicle is proceeding; every motor vehicle so operated shall have a rear light so placed as to show a red light from behind, and a white light so arranged as to illuminate the rear number plate in accordance with the provisions of section four. No motor vehicle shall be operated upon the public highways within the limits of any city or borough of this state at any time nor on any public highway between the hours of nine o'clock in the evening and six o'clock in the morning unless the engine of such vehicle shall be muffled while so operated. No motor cycle shall be operated at any time with its muffler open. No person shall use on any vehicle upon the public highways of this state, except upon fire apparatus or upon an ambulance, any siren horn for a signal.

Fees.

Sec. 8. The secretary shall collect fees as follows: for the registration of every motor cycle, two dollars; for the registration of every commercial motor vehicle, regardless of the horse power thereof, five dollars for the first one thousand pounds or fractional part thereof of carrying capacity as determined by said secretary, and two dollars for each additional one thousand pounds, or fraction thereof over four hundred pounds, above the first one thousand pounds of carrying capacity; for the registration of each motor vehicle operated for hire by a liveryman, ten dollars; for the registration of all motor vehicles owned by a dealer in motor vehicles, twenty dollars; for the registration of all motor cycles owned by a dealer in motor cycles, ten dollars; for the registration of every other motor vehicle fifty cents per horse power, said horse power to be determined according to the provisions of section two of this act; for the substitution of the registration of a motor vehicle, except a motor cycle, previously registered in accordance with the provisions of section two of this act, two dollars; except that in the case of a liveryman the fee shall be one dollar for each substitution; for the substitution of the registration of a motor cycle, fifty cents; for each motor vehicle engine owned by a manufacturer of motor vehicles and tested or operated on the highways of this state, one dollar, but every manufacturer shall deposit with the secretary upon making application for registration as a manufacturer, and in January of each year thereafter, twenty-five dollars, which sum shall be a minimum fee for every manufacturer so testing or operating less than twenty-five motor vehicle engines during the year, as shown by his annual statement, and shall be applied

to the total amount required to be paid by said manufacturer so testing or operating more than twenty-five motor vehicle engines during the year, as shown by his annual statement, and every such manufacturer shall, on or before December thirty-first in each year, make a written report, under oath, to the secretary, of the number of engines so tested or operated during the year last preceding; for each operator's license to operate motor vehicles, two dollars; for every additional copy of a certificate of registration or license, fifty cents; for every set of number plates furnished in addition to those allowed by section four, one dollar; provided, that the secretary shall furnish, without charge, copies of certificates and licenses and other documents relating thereto to officers of this state, or of any court thereof, or of any city, town, or borough therein, or to any official of any other state. No fees shall be collected for any motor vehicle owned by a municipality and used exclusively in the conduct of municipal business.

Revocations and Suspensions.

Sec. 9. (a) The secretary may suspend or revoke any certificate of registration or any license issued to any person under the provisions of this act, with or without a hearing, for any cause which he may deem sufficient, and may order such certificate or license to be diverted to him whenever he has reason to believe that the holder thereof is an improper or incompetent person to operate motor vehicles or is operating improperly or so as to endanger the public; and neither the license nor the certificate of registration shall be reissued unless, upon investigation, said secretary determines that the operator may again be legally permitted to operate. (b) Upon a subsequent conviction of any person for an offense involving a violation of section eleven of this act, or of operating a motor vehicle while under the influence of intoxicating liquor or drugs, or upon a wager, or in a race, or of going away without stopping and giving his name and address after causing injury to any person or property, the secretary shall immediately revoke the license of the person so convicted, and if any person convicted of any such offense a second time by a trial court shall appeal from the decision of said trial court, said secretary shall suspend, forthwith, the license of the person so convicted and appealing, and shall order the license delivered to him, and shall not reissue the same unless such person is acquitted upon such appeal, or unless the secretary, in his discretion, shall decide that said license should be reissued. If the operator so convicted a second time is the owner of a motor vehicle, or the bailee or employee of the owner and was the bailee or was employed by such owner when the first conviction was had, said secretary shall revoke the certificate of registration of such owner, or of the bailor or employer of the operator so convicted. (c) Whenever any license or certificate shall have been revoked under the provisions of this act, no new license or certificate shall be issued by said secretary to such person until after thirty days from the date of such revocation, nor thereafter except in the discretion of said secretary; and no motor vehicle, the registration of which has been so suspended or revoked shall be registered in the name of any person until at least thirty days from the date of suspension or revocation unless said secretary shall determine otherwise. (d) Whenever the death of any person results from any accident in which a motor vehicle is concerned, said secretary shall forthwith suspend the license of the operator of the motor vehicle involved in said accident and shall order said license to be delivered to him, and shall revoke the same, unless, upon investigation, he determines that the accident occurred without serious fault upon the part of such operator. No operator whose license is so revoked shall be licensed again within one year after the date of the revocation, nor thereafter except in the discretion of said secretary. (e) Notice of the revocation or suspension of any license or certificate of registration shall be transmitted forthwith by said secretary to the chief of police of the city or prosecuting officers of the borough or town in which the person whose license or certificate of registration so revoked or suspended resides. Said secretary shall revoke, up-

on due notice and hearing, (f) all the certificates and licenses of any person who shall loan or rent to any other person, or who shall permit any other person to take, any license, certificate, or number plate for use in or upon any motor vehicle other than the one for which it was issued by said secretary; (g) the license of any manufacturer or dealer who shall permit any person to use in or upon any motor vehicle not owned by said manufacturer or dealer any license, certificate, or number plate issued to such manufacturer or dealer by said secretary; (h) the license of any person who loans or rents to any other person, or permits any other person to use his operator's license. No new license or certificate shall be issued to any such person whose license or certificate has been revoked under subsection (f), (g), or (h) of this section, until after six months from the date of such revocation. In the administration of the laws and regulations relating to motor vehicles and to their operators, the secretary may summon witnesses in behalf of the state and may administer oaths and take testimony, and may also cause depositions to be taken and may order, when necessary for the carrying out of such provisions or of any of the powers granted him thereby, the production of books, papers, and documents. Any person who swears or affirms falsely in regard to any matter or thing respecting which an oath or affirmation is required by said secretary, or by this act, shall be deemed guilty of perjury. The fees for attendance and travel of witnesses shall be the same as for witnesses before the superior court, and shall be paid by the state treasurer, on the day of attendance, upon the certificate of said secretary, which shall be filed with the comptroller. The superior court shall have jurisdiction in equity, upon the application of said secretary, to enforce all lawful orders of the secretary under this section.

Non-residents.

Sec. 10. Any non-residents of this state who has complied with the laws of the state within which he resides, relating to motor vehicles and the operation thereof, may use the highways of this state without complying with the provisions of this act relating to the registration of motor vehicles and the licensing of operators; provided, that such non-resident shall cause to be displayed on his motor vehicle, upon two plates substantially as required by section four of this act, the distinguishing number or mark of the state within which he resides; and provided further, that if any non-resident be convicted of violating any provision of section eleven, twelve, or eighteen hereof, he shall thereafter, for the remainder of the calendar year, be subject to and required to comply with all of the provisions of this act.

Prohibited Acts.

Sec. 11. No person shall operate a motor vehicle on the public highways of this state recklessly or at a rate of speed greater than is reasonable and proper, having regard to the width, traffic, and use of the highway, or so as to endanger the property or the life or limb of any person.

Sec. 12. Upon approaching any person walking in the traveled portion of any highway, or a horse or any other draft animal being led, ridden, or driven therein, and in passing such person or such horse or other draft animal, the person operating a motor vehicle shall have the same under control, and shall reduce its speed when reasonable care requires. If such horse or other draft animal being so led, ridden, or driven, shall appear to be frightened, and if the person in charge thereof shall signal so to do, the person operating such motor vehicle shall bring the same immediately to a stop, and, if traveling in the opposite direction, shall remain stationary so long as may be reasonable to allow such horse or other draft animal to pass, or if traveling in the same direction, shall use reasonable caution in thereafter passing such horse or other animal. Upon approaching an intersecting highway, or a curve or a corner of a highway, every person operating a motor vehicle shall slow down and give a timely signal with his bell or horn when reasonable care requires, and shall keep to the right of the intersection of the center of both highways when turning to the right, and pass to the right of the intersection of the centers of said highways before turning to the left.

Sec. 13. If the rate of speed of a motor vehicle operated on a public highway of this state exceeds twenty-five miles an hour for a distance of one-eighth of a mile, such rate of speed shall be prima facie evidence that the person operating such motor vehicle is operating the same at a rate of speed greater than is reasonable and proper, and in violation of the provisions of section eleven of this act. If, except within the limits of an incorporated city, the rate of speed of a motor vehicle operated on the public highways of this state, where the operators' view of the road and traffic is obstructed, when approaching a crossing or intersecting public highway, or when traversing a bridge or a sharp turn, or a steep descent, or a curve in the highway, exceeds ten miles an hour, such rate of speed shall be prima facie evidence that the person operating such motor vehicle is operating the same at a rate of speed greater than is reasonable and proper, and in violation of the provisions of section eleven of this act. If the rate of speed of a motor vehicle operated upon the public highways of this state in passing any street railway car that is stationary or about to stop, on the same side of the car on which passengers are ordinarily received and discharged, exceeds three miles an hour, such rate of speed shall be prima facie evidence that the person operating such motor vehicle is operating the same at a rate of speed greater than is reasonable and proper, and in violation of the provisions of section eleven of this act.

Sec. 14. No person shall operate or use any motor vehicle upon the highways of this state without the permission of the owner.

Sec. 15. No person shall interfere or tamper with a motor vehicle without the permission of the owner.

Local Ordinances.

Sec. 16. No city, town, or borough shall have power to make any ordinance, by-law, or resolution respecting the speed of motor vehicles, and no ordinance, by-law, or resolution made by any city, town, or borough in respect to the rate of speed of motor vehicles shall have any force or effect; provided, that power given to any town, city, or borough to regulate shows, processions, assemblages, or parades in streets and public places, and to regulate the use of public parks, and all ordinances, by-laws, or regulations which have been or which may be enacted in pursuance of such powers shall remain in full force and effect.

Penalties.

Sec. 17. Any person operating a motor vehicle upon the public highways of this state who fails to comply with or violates any of the provisions of section two, three, four, five, seven, eight, eleven, twelve, fifteen, or twenty-five of this act shall be fined not more than one hundred dollars, or imprisoned not more than ten days, or both, for a first offense, and shall be fined not more than five hundred dollars, or imprisoned not more than six months; or both, for any subsequent offense. Any person operating a motor vehicle upon the highways of this state while under the influence of intoxicating liquor or drugs, or upon a wager, or in a race, or who operates a motor vehicle for the purpose of making a record and thereby violates section eleven of this act, or who knowingly goes away without stopping and making himself known after causing injury to any person or property, or who shall, in his application to the secretary for a license or certificate for a motor vehicle or for a license as a motor vehicle operator, make any material false statement, shall be fined not more than two hundred dollars, or imprisoned not more than six months, or both, for a first offense, and shall be fined not more than five hundred dollars, or imprisoned not more than one year, or both, for any subsequent offense, except that the penalty upon any subsequent conviction of operating a car while intoxicated or under the influence of drugs shall be as hereinafter provided. Any person convicted of any violation of section fourteen of this act, or convicted a subsequent time of operating a motor vehicle while under the influence of intoxicating liquor or drugs, shall be imprisoned not less than six months and not more than two years.

Sec. 18. Any person who, while operating or in charge of a motor vehicle, shall refuse, when requested by an officer, to give his name and address or the name and address of the owner of such motor vehicle, or who shall give a false name or address, or who shall refuse or neglect to stop when signaled to stop by an officer, or who refuses, on demand of such officer, to produce his license to operate such vehicle or his certificate of registration, or to permit such officer to take the license or certificate in hand for the purpose of examination, or who refuses, on demand of such officer, to sign his name in the presence of such officer, and any person who, on the demand of an officer acting under instructions from the secretary, refuses, without a reasonable excuse, to surrender his license to operate motor vehicles, or his certificate of registration of any motor vehicle operated or owned by him, or the number plates furnished by the secretary for such motor vehicle, or who refuses or neglects to produce his license when requested by a court or trial justice, shall be fined not more than one hundred dollars, or imprisoned not more than ten days, or both. Any person violating any of the provisions of this act for which no specific penalty is provided shall be fined not more than one hundred dollars, or imprisoned not more than thirty days, or both.

Sec. 19. No recovery shall be had in the courts of this state, by the owner or operator, or any passenger of a motor vehicle which has not been legally registered in accordance with section two or three of this act, for any injury to person or property received by reason of the operation of said motor vehicle in or upon the public highways of this state, unless said motor vehicle is the property of a non-resident and is within the provisions of section ten of this act; nor shall such recovery be had if the motor vehicle be registered but is being operated by an unlicensed person in violation of section five of this act.

Jurisdiction of Justice Courts.

Sec. 20. In all complaints for the violation of any provision of this act the justice of the peace before whom the same may be tried shall have jurisdiction and power to render judgment and issue process of execution and mittimus thereon where such fine or penalty imposed shall not exceed two hundred dollars, or imprisonment thereon where such fine or penalty imposed shall have the right of appeal as in other cases. The justice of the peace or court before whom a final conviction shall be had under the provisions of this act shall endorse upon the license of the person convicted the dates and particulars of such conviction.

Bail and Recognizances.

Sec. 21. Any person arrested for violating any of the provisions of this act may tender as bail a motor vehicle of which he is owner, and if such vehicle is of sufficient value it shall be accepted as security for his appearance, in lieu of any other bail. Any person licensed under this act who is arrested by an officer for violation of any of its provisions, except those relating to driving while intoxicated or under the influence of drugs, or to using a motor vehicle without the permission of the owner, shall, unless such violation involves the death or serious injury of any other person, upon showing the proper certificate for the motor vehicle which he was driving at the time of said violation and his own license as an operator, be allowed to go, by said officer, on his own recognizance; provided, that if any person so arrested shall fail to appear for trial at the proper time and place, when summoned by a notice sent by registered mail, at least five days before the day of said trial, to the address disclosed in his said operator's license, his said certificate or license, and all others which he may hold, shall be immediately revoked by said secretary, and no new license or certificate shall be issued to him within three months from the date of such revocation, nor shall any certificate be granted to any other person, within thirty days after such revocation, for any of the motor vehicles the certificates of which shall be thus revoked. The provisions of this section shall be extended to all non-resident operators of motor vehi-

cles residing in a state the proper authorities of which shall agree with said secretary to revoke, for a period of at least sixty days, the certificates and licenses of any owner or operator of a motor vehicle who shall fail to appear for trial when summoned as hereinbefore provided.

Records and Reports.

Sec. 22. A full record shall be kept by every court or justice of the peace of all cases in which any person is convicted of any offense involving a violation of any of the provisions of this act, or in which any person arrested for such a violation shall forfeit his bail, or have his case nolle by payment of other than costs, and a certified abstract of such record, the expense of which shall be taxed at two dollars in the costs of the case, payable to the clerk of the court or the justice of the peace reporting such conviction, together with a statement of the number of the operator's license to the person so convicted or so forfeiting his bail shall, within two days after the date of such conviction or forfeiture, be transmitted to the secretary by said clerk of the court or justice of the peace. Such courts and justices of the peace shall furnish to said secretary the details of all cases heard before them, and shall make such recommendation to said secretary as to the suspension or revocation of the licenses of the parties defendant as they deem proper.

Miscellaneous Provisions.

Sec. 23. Appeals from the decision of the secretary made under the provisions of this act may be taken to the superior court within the county wherein the appellant resides, and appeals by any person residing outside of this state shall be taken to the superior court within Hartford county. The provisions of section 2658 of the general statutes concerning appeals from a decision of the county commissioners shall, so far as the same are applicable, govern the appeals from said secretary herein provided for.

Sec. 24. The secretary, the selectmen of any town, or the prosecuting officer of any city or borough court shall have the right to call upon the state police department for aid in enforcing the provisions of this act.

Sec. 25. Every person who conducts a public garage shall keep a book upon which shall be registered the name of the maker and the register number of every transient motor vehicle left or stored in such garage, together with the name of the operator of such motor vehicle and the number of such operator's license, unless said operator declares himself to be the owner of such motor vehicle, in which case no registration shall be required; and the operator of said motor vehicle so temporarily left or stored shall, unless he declares himself to be the owner thereof, enter on said book the time when said motor vehicle enters such garage and the time when he takes the same therefrom, and shall sign his name to such entry.

Sec. 26. All fines collected for violation of any of the provisions of this act and all forfeitures and fees other than taxable costs shall be paid over to the secretary by the clerk of the court or by the justice of the peace imposing the same, and all fees imposed by this act and collected by said secretary, together with all fines received by him as aforesaid, shall be by him paid monthly into the treasury of the state, and said money shall be expended under the direction of the highway commissioner for the maintenance of state highways, without specific appropriation by the general assembly, in addition to all sums already appropriated or that may hereafter be appropriated by the general assembly for the same purpose; and in the expenditure upon the highways of the moneys so received, the provisions of section three of chapter 264 of the public acts of 1909 with regard to reimbursement by the towns shall not be applicable.

Sec. 27. Chapters 211 and 264 of the public acts of 1909 and all acts or parts of acts inconsistent herewith are hereby repealed.

Sec. 28. This act shall take effect August 1, 1911, except that sections two, three, and eight and so much of section twenty-seven as repeals sections two, three, and eight of chapter 211 of the public acts of 1909 shall take effect January 1, 1912.

986,832. Safety Fender for Automobiles. Ignacy Ksiazek, Chicago, Ill. Filed July 11, 1910. Serial No. 571,371.

1. In a device of the class described, a guard hinged above the pavement, a buffer rod projecting in advance of the vehicle frame at a distance above the pavement, a fender rod hung to the vehicle frame below the buffer rod and adapted to swing back over the guard, and means adapted to disengage said sustaining means when the fender rod is swung back, substantially as described.

986,880. Attachment for Opening and Closing Automobile Doors. Solyman J. Way, Manchester, Vt. Filed March 31, 1910. Serial No. 552,612.

1. In a door manipulating apparatus, the combination with a door and its frame; of leaf hinges connecting the said door and frame, a common pintle for said hinges fixedly secured to the leaves carried by the door, a latch arranged in the door frame to engage with the door and maintain the latter in closed position, an operating lever, a rocker arm, means connecting the rocker arm with the latch and a connection between the operating lever and the pintle operating to turn the latter, and means associated with the said connection operating to actuate the rocker arm to move the latch from engagement with the door in advance of the turning movement of the pintle.

986,904. Shock Absorber. Charles M. Burton, New York, N. Y. Filed June 9, 1910. Serial No. 565,931.

A device of the class described, comprising a cylinder having interiorly formed threads at each terminal thereof, nuts adapted to operate on said threads, springs carried by said nuts the inner terminals of said springs being spaced and the upper of said nuts having an opening therein, a piston rod adapted to reciprocate in said opening and through the upper of said springs, a piston detachably carried at the lower terminal of said rod having a rubber collar on each side thereof, an arm carried at the lower terminal of said cylinder having a transverse channeled plate at its outer terminal, a clamping plate co-operating therewith, an eye formed at the upper end of said piston rod, and an arm co-operating therewith.

986,921. Shock Absorber. James Madison Jackson, Parkersburg, W. Va. Filed Dec. 29, 1909, Serial No. 535,411. Renewed Nov. 8, 1910. Serial No. 591,326.

1. A shock absorber for motor vehicles, consisting of a bracket or hanger secured to the frame of the vehicle, a coiled spring

secured to the axle of the same, a rod extending upwardly from the upper end of the spring through the aforesaid hanger or bracket, and means for both regulating and limiting the vertical play of the rod through the hanger or bracket, said means located on the rod both above and below the bracket.

986,947. Friction Clutch Mechanism. Gustave A. Schacht, Cincinnati, Ohio. Filed Nov. 8, 1909. Serial No. 526,829.

1. In a friction clutch mechanism, a shaft, a fly-wheel or gland fastened thereto and having a flat broadside engaging surface, a friction disk loosely mounted and normally free to slide on said shaft and having a flat broad-side engaging surface adapted to engage said broad-side engaging surface on the fly-wheel, a beveled or tapering engaging surface on the friction disk, a tapering or wedge-shaped member adapted to revolve with the fly-wheel and means for adjusting the wedge-shaped member to and from engagement with said friction disk.

986,966. Pivot Light. Peter B. Donahoe, Oakland, Cal., assignor to Alfred H. Lent, Oakland, Cal. Filed July 10, 1909. Serial No. 506,990.

A lamp supporting device comprising a flattened spring with a lamp bracket secured thereto and having an enlarged projecting end, a pivot shaft carried by said end, said pivot shaft projecting through said bracket and having on its lower end a crank arm provided with a pivot pin on its outer end, said pin having a bifurcated link secured thereto, a rod having one end connected to said bifurcated link, and a knuckle joint having an upstanding pin provided with a link having a bifurcated end having the other end of said rod mounted therein.

987,139. Bracket for Supporting Lamps and Other Articles. George William Houck, London, England. Filed July 15, 1907. Serial No. 383,930.

1. An adjustable lamp bracket comprising a pair of prongs, each having a stem, clamping plates through which said stems pass, and means for slamping the stems to the plates so that the prongs are simultaneously fixed at the required distance apart and the plates fixed in position on the part to which the bracket is fixed.

987,164. Valve Mechanism for Internal-Combustion Engines. Alden E. Osborn, New York, N. Y. Filed July 3, 1909. Serial No. 505,860.

1. A valve mechanism comprising a casing having inlet and exhaust chambers and a distributing passage, a valve located at one end of the said passage for controlling the same, and means located at the other end of the said passage, and operated by the movement of the said valve, for connecting the said passage with either the said inlet of the said exhaust chamber.

987,216. Metal Rim for Vehicle-Tires. John Clarence Cole, Chicopee Falls, Mass.,

assignor to The Fisk Rubber Company, Chicopee Falls, Mass., a Corporation of Delaware. Filed Nov. 18, 1910. Serial No. 592,996.

1. A demountable rim for vehicle tires of the type specified comprising two annular parts each having a rolled up edge to engage the bead on the base of the tire, each of said annular rim parts having projections thereon extending toward the opposite part, a projection on one of said parts fitting between two of the projections on the opposite part, separate, independently operable, locking devices permanently mounted on certain of said projections and movable circumferentially of the rim into locking engagement with a contiguous projection on the other rim part, whereby the two rim parts may be locked together.

987,322. Automobile Lamp-Bracket. Ross H. Rohrer, Quarryville, Pa. Filed Aug. 5, 1909. Serial No. 511,373.

1. The combination with a steering wheel of a motor vehicle having a stub-axle, and a fixed axle, the end of which is forked and provided with journal bearings between which said stub-axle fits, of a rotary movable spindle passing through said journal bearings and stub-axle, an arm extending outward from said spindle, a U-shaped yoke carried upon the end of the arm, a lamp rotatably supported in said yoke, and means for adjusting the lamp in any desired rotated position.

987,358. Motor-Vehicle. Emil Gruenfeldt, Cleveland, Ohio, assignor to The Baker Motor Vehicle Company, Cleveland, Ohio, a Corporation of Ohio. Filed Dec. 28, 1919. Serial No. 535,230.

1. In an electric motor vehicle having a frame and a driving axle mechanism including live axle sections and a differential mechanism with a driving gear having its axis in a vertical plane disposed longitudinally of the said frame, an electric motor suspended from said frame and having its armature shaft longitudinally disposed relative to the frame and at one side of the longitudinal plane of said axis of the differential mechanism driving gear, driving shafting connected at its rear end to said differential drive gear and extending forward therefrom and along one side of said electric motor, a bearing for said shafting arranged near its front end, and reduction gearing between the front end of said driving shafting.

987,430. Speed-Changing Mechanism. William C. Conant, Oak Park, Ill. Filed Mar. 7, 1910. Serial No. 547,687.

1. In speed-changing mechanism, the combination of revoluble gear-members movable with relation to each other and operated from a common source against the resistance of a load and operatively connected together to cause one of said gear-members to react upon the other, a fulcrum and means operatively connecting one of said gear-members with said fulcrum to exert against the latter the combined reaction of the gears.

Kelly-Springfield Auto Tires

Made by the Makers of the famous Kelly-Springfield solid tire

The Atwater Kent Ignition System

The Atwater Kent ignition system is used by more than twenty manufacturers of cars and motors as regular equipment. It has also been installed on thousands of cars, including every standard make, in place of other less reliable ignition apparatus.

The efficiency of the Unisparker is from five to eight times that of the ordinary vibrator coil system, and the results obtained are superior to the magneto.

Used either as sole ignition or as a double system in combination with a high tension magneto, the Unisparker offers advantages that cannot be duplicated in any other apparatus. Considering its high efficiency, the Unisparker is the lowest priced system you can buy.

Send for descriptive booklet and prices.

No. 3.

BOARD OF TRADE BEGINS BUSINESS

Decides to Date Commencement of Operations from July 1—Aggressive Patent Campaign is in Prospect.

Although the Automobile Board of Trade has been in legal existence for some three months, it really did not "get down to business" until Thursday last, 6th inst., when the first meeting of the general membership was held in New York. It then took over the offices of the A. L. A. M. and decided that its affairs, including the members' reports of their respective production of cars, shall bear date as of July 1st. On these reports of outputs, which will be rendered quarterly, the amount of annual dues will be based, on a ratio of one-tenth of one per cent.

The subjects of shows and patents were discussed, but as the lease of Madison Square Garden still stands in the name of the Association of Licensed Automobile Manufacturers, which has not been wound up, the matter of shows was touched only in a more or less informal manner. The matter of patents, however, received more attention, and while no official statement to that effect has been issued, it is known that a decision has been reached to pursue an aggressive campaign in that direction. There is no Selden patent in hand, but there are a number of far-reaching patents owned by members of the Board of Trade which have been permitted to lie dormant, but which it is the intention to take up and actively exploit, with a view of bringing infringers to book.

At Thursday's meeting, Thomas Henderson, the Winton representative, who is retiring from business, tendered his resignation as a director of the Board of Trade; it was accepted with regret and W. C. Leland, of the Cadillac Motor Car Co., elected to fill the vacancy.

The members present at the meeting were as follows: John S. Clark and M. L.

Downs, Autocar Co.; C. W. Nash, Buick Motor Co.; W. C. Leland, Cadillac Motor Car Co.; Hugh Chalmers, Chalmers Motor Co.; M. S. Hart, Corbin Motor Vehicle Corp.; R. Scott Smith, Elmore Mfg. Co.; G. H. Stillwell, H. H. Franklin Mfg. Co.; G. A. Matthews, Jackson Automobile Co.; A. N. Mayo, Knox Automobile Co.; S. T. Davis, Jr., and J. T. Roach, Locomobile Co. of America; W. C. Shepherd and F. F. Matheson, Matheson Auto. Co.; Benjamin Briscoe and Alfred Reeves, U. S. Motor Co.; Wm. E. Metzger, Metzger Motor Car Co.; J. W. Gilson, Mitchell-Lewis Motor Co.; E. J. Moon, Moon Motor Car Co.; C. C. Hanch, Nordyke & Marmon Co.; Geo. E. Daniels, Oakland Motor Car Co.; S. D. Waldon, Packard Motor Car Co.; L. H. Kittredge, Peerless Motor Car Co.; Charles Clifton, Pierce-Arrow Motor Car Co.; George Pope, Pope Mfg. Co.; H. O. Smith, Premier Motor Mfg. Co.; R. H. Salmons, Selden Motor Vehicle Co.; G. S. DeLaney, Stevens-Duryea Co.; E. P. Chalfant, E. R. Thomas Motor Co.; Geo. W. Bennett, Willys-Overland Co.; C. W. Churchill, Winton Motor Carriage Co., and Acting Manager H. A. Bonnell.

To Make Tires in South Bend.

W. A. Bentley, of Akron, and M. G. O'Brien, of Mansfield, O., who are the moving spirits in the recently organized South Bend Tire & Rubber Co., have obtained an option on an 18-acre site in South Bend, Ind., on which they purpose erecting a four-story plant. They expect to have it in operation by the end of the year and to be employing 600 men within twelve months.

G. W. Perkins to Joint U. S. Motor.

According to reports in financial circles, George W. Perkins, formerly of J. P. Morgan & Co., will become a member of the finance committee, of the United States Motor Co., at the regular meeting of the directors on July 27. The committee then will be composed of Eugene Meyer, who recently became chairman, Richard Irvin and Perkins.

N. A. A. M. SECURES THE PALACE

And Having Secured It, Sets Date for Its New York Show—New Members Elected—More Exhibitors Reinstated.

Having effected the necessary lease of the new Grand Central Palace, the National Association of Automobile Manufacturers, at its regular meeting on Thursday last, 6th inst., made definite its decision to conduct an open show in New York during January next, the probability of which was announced some weeks since.

If nothing occurs meanwhile to permit the dates to be advanced, the show will open Wednesday, January 10 and close one week later, Wednesday, January 17. As the Board of Trade show in Madison Square Garden will be inaugurated Saturday, January 6, and will close two weeks later, the N. A. A. M. function thus will be in progress during a portion of both of those weeks. The N. A. A. M. show will include both pleasure cars and commercial vehicles, which, however, will be staged in separate departments; and according to the official announcements, "it is practically settled that the Motor and Accessory Manufacturers will take the greater part of the space devoted to that branch of the industry which the organization represents."

The price of space, including decorations, equipment and charges of every character, will be \$1.25 per square foot. Of the net proceeds of the show, if any, the association will retain one-half. The remainder will be rebated to exhibitors in proportion to the amount of their space rental. The method of allotment will be the same as that at the Chicago show. The executive committee referred all other details to the show committee and the general manager with full authority to proceed.

At Thursday's meeting, the Krit Motor Car Co. and Grabowsky Power Wagon Co. were elected to membership, and favorable action was taken on applications for rein-

statement of Vandewater & Co., Ltd., Crawford Automobile Co., Warren Motor Car Co., and James Cunningham Son & Co., who took part in the "independent" and unsanctioned show in Grand Central Palace last winter and were therefore debarred from participation in sanctioned shows. This reinstatement will permit them to exhibit at next year's N. A. A. M. shows, both in New York and Chicago.

C. G. Stoddard resigned as the representative of the Dayton Motor Car Co., and Alfred Reeves was elected as representative of that company and to fill the vacancy created on the N. A. A. M. executive committee.

The membership of Charles E. Duryea was transferred to the Duryea-Auto Co., of Saginaw, Mich., and Harry S. Haupt was elected to represent the American Locomotive Co., in place of James Joyce, retired.

The members present at the meeting were W. E. Metzger, Charles Clifton, Alfred Reeves, L. H. Kittredge, S. T. Davis, Jr., H. O. Smith, A. L. Pope, Thomas Henderson, J. W. Gilson, Benjamin Briscoe, S. A. Miles.

Strauss Can't Employ Name Klaxon.

Matthew Strauss, of Buffalo, will no longer advertise or sell Newtowne horns as "Newtone Klaxon Pattern Horns." When he began doing that sort of thing, the Lovell-McConnell Mfg. Co., makers of the Klaxon, lost no time in instituting suit for infringement of their trademark and for a preliminary injunction, and when the case came to trial before Judge Hazel in the United States Circuit Court in Buffalo, on June 27, and after full argument had been heard, Strauss decided that discretion was the better part of valor and consented to the issuance of a permanent injunction against him and also agreed to pay the costs. The suit was settled on those terms. Previously, in November, 1910, in the same court, Strauss had been adjudged guilty of infringing the basic patents on the Klaxon horns and had been enjoined, but apparently he overlooked the fact that the name Klaxon constituted a registered trademark and cannot be trifled with.

M. A. M. Fill Two Vacant Offices.

At the meeting of the Motor and Accessory Manufacturers in New York, on Friday last, 7th inst., H. W. Chapin, of the Brown-Lipe-Chapin Co., was elected treasurer of the organization to succeed the late W. S. Gorton. Mr. Chapin had been filling the office as treasurer pro tem. since the death of Mr. Gorton. James H. Foster, of the Hydraulic Pressed Steel Co., was chosen to fill the vacancy on the board of directors. Four new members were elected, viz.: Allen Auto Specialty Co., of New York; Detroit Carriage Co., of Detroit; Champion Ignition Co., of Flint, Mich., and the American Circular Loom Co., of Boston, Mass., which recently acquired the ignition business of the Lutz-Lockwood Mfg. Co.

HERE'S A GUARANTEE FOR TRUCKS

Formulated by New York Tradesmen to Assist Final Solution—Covers a Period of Six Months.

After about two months of deliberation the Motor Truck Club, of New York City, has framed a model guarantee for commercial vehicle application, which is tentatively advanced, with the object of obtaining possible criticism pending its final adoption by the members of the club, who are agents and dealers in the Metropolitan district. The agreement provides for the shipment to the purchaser prepaid of parts that have proved defective in workmanship or material, within six months of the date of original shipment. Tire replacements, "wear and tear" and "accidents" are excluded, and a special "snapper" clause is added which provides for the termination of the contract upon the truck being "overloaded, misused or neglected," or upon its being equipped with a body not approved by the manufacturer.

In presenting its suggestion the committee, which consists of John Hanson Kennard, chairman, Couple-Gear Co.; E. Lascaris, DeDion Bouton; A. N. Bingham, Hewitt Motor Truck Co.; and Charles E. Stone, Alden Sampson Mfg. Co., makes the rather striking assertion that contrary to the ordinary supposition, the guarantee is a means of protecting the manufacturer against the purchaser. Instead of the purchaser requiring protection against the maker, it is held that the manufacturer needs to be guarded against the impositions of the unscrupulous user.

"It is generally supposed that a guarantee is the protection which the purchaser has against the manufacturer," says the report, "but the committee is of the opinion that, as a matter of fact, it is the protection of the manufacturer against the purchaser. A responsible manufacturer will always protect the purchaser in every reasonable manner, irrespective of guarantee, as good faith and good business require it, but the unreasonable and unfair purchaser is the one who always seeks to hold the manufacturer to the letter of his contract, and against such persons the manufacturer must look to his written agreement for his protection. The guarantee given with a truck does not mean that the manufacturer is going to limit himself to what is there expressed, but it means that if he is not fairly dealt with he cannot be called upon for more than that guarantee agrees to do."

Action on the adoption of the standard form has been deferred until the next monthly meeting of the club, pending which Charles E. Stone, the secretary, has been authorized to furnish copies to manufacturers for their study and criticism. The proposed form, which it is said one manu-

facturer has adopted already, is as follows:

"We guarantee to replace, free of charge, in the truck if delivered to us, any parts which prove defective in workmanship or material within six months from date of shipment. If the truck is not sent to us we will ship such defective parts by freight, prepaid.

"All parts on which replacements are claimed must promptly be sent to us, carriage prepaid, for inspection.

"This guarantee does not cover tires, wear and tear, or accidents; and ceases upon the truck being overloaded, misused or neglected, or upon a body, not approved by us, being placed on the chassis."

Aeroplanes at First Palace Show.

Aeroplanes will constitute a feature of the show in Grand Central Palace, New York, which will occur during the week of January 1st, under the auspices of the Automobile Manufacturers Association of America, which grew out of the privately-promoted show held there last winter in which air craft also played a part. On the forthcoming occasion, however, the latter display will be fathered by the Aeronautical Manufacturers Association, which has entered into an arrangement with the automobile manufacturers' organization whereby it will have the use of the entire third floor of the Palace. The fact that such an arrangement had been consummated was made public after a meeting of the executive committee of the A. M. A. A. in New York on Friday last. It was also announced that L. J. Bergdoll, of the Bergdoll Motor Co., of Philadelphia, had been appointed chairman of the show committee.

Will be Willys-Garford Sales Co.

The news that the Willys-Overland interests and the Garford interests had formed a selling arrangement whereby Garford cars and trucks would be marketed through Overland agents, which was published exclusively in last week's Motor World, proved one of the genuine surprises the trade has received in some time. The original intention to style the new selling company the Willys-Garford Corporation has been changed, however, and the enterprise will be styled the Willys-Garford Sales Co., with headquarters in Toledo and with John N. Willys as president. The stock in the sales company will be held wholly by Willys and his associates, of whom George W. Bennett will be vice president and general manager and Walter Stewart, secretary and treasurer, as was stated last week.

Another Truck Company in Detroit.

The Banta Motor Truck Co., capitalized at \$100,000, has been organized in Detroit, where it expects to begin operations within 60 days. The principal stockholders are Jacob H. Stoerkel, George H. Banta, Hiram P. Stalker and Daniel P. Cassidy. The company purposes producing a light delivery wagon, listing at \$700.

HENDERSON CUTS BUSINESS TIES

**Trade Veteran's Retirement Made Notable
—Surprised and Honored by Associates
Amid Scotch Surroundings.**

Thomas Henderson, vice-president of the Winton Motor Carriage Co., who has for many years been prominently identified with the work of the automobile trade associations, has decided to retire, not only from the Winton company but all other business activities. He already has resigned as a director of the Automobile Board of Trade, and on the first Wednesday of September will retire from the executive committee of the National Association of Automobile Manufacturers, Inc., of which he has been a member for ten years.

As an appreciation, on Thursday evening, July 6th, twenty-five men in the trade, with whom Mr. Henderson has been prominently associated, gave a dinner in his honor at the Engineers' Club in New York and presented him a loving cup and an address engrossed on vellum and beautifully bound. The gentlemen present, in addition to Mr. Henderson, were S. T. Davis, Jr., William R. Ihnis, W. T. White, A. L. Pope, Alfred Reeves, Charles Clifton, W. E. Metzger, S. D. Waldon, George Pope, R. D. Chapin, H. O. Smith, E. E. Bartlett, H. B. Joy, L. H. Kittredge, C. C. Hildebrand, Hugh Chalmers, J. W. Gilson, C. C. Hanch, S. A. Miles, Benjamin Briscoe, M. J. Budlong, R. D. Garden, Wm. Mitchell Lewis, W. C. Leland, Frank Briscoe.

The decorations, in recognition of Mr. Henderson's nationality, were largely of Scotch plaids, thistle and heather. Mr. Henderson, who, until the last moment, had no inkling of the event, was met on his arrival at the club by a Scotch piper in full regalia. The music of the evening also consisted largely of Scotch airs.

The address was presented by W. E. Metzger, president of the National Association of Automobile Manufacturers, Inc., and the cup by Charles Clifton, president of the Association of Licensed Automobile Manufacturers. Both gentlemen spoke earnestly and feelingly of the esteem in which Mr. Henderson is held by every one with whom he is acquainted, as did Colonel George Pope and others who followed. Mr. Henderson's response was a feeling one, which deeply touched all those who heard it.

Among other things, the engrossed address presented to Mr. Henderson, said:

"We have learned, by years of acquaintance, more or less intimate, to appreciate you at your true value. We know that sterling qualities were in your constitution from the beginning—industry, capability, integrity and, not the least of them, determination, for any good quality needs backbone to make it effective. We know that

circumstance molded your character, and your character mastered circumstance. . .

. . . The size of a gathering is not the most important thing concerning it. The spirit and purpose of the gathering are all important. You will accept our assurance that the signatures hereto attached—those of the friends who surround you—and the sentiments herein expressed, represent the spirit, purpose and good will of the entire world of automobiling. You will permit us to hope that in your days to come—days 'blest with health, and peace and sweet content'—you will still be frequently found among those who consider it an honor to subscribe themselves, your loyal friends."

Changes Among Prominent Tradesmen.

W. K. Hadley has been appointed sales manager for Chas. E. Riess & Co., of New York, general eastern distributors of Marion cars. Previously he was eastern sales manager for the Marion Sales Co., of Indianapolis, Ind.

L. W. Place, who has served the Olds Motor Works in several capacities, has been appointed assistant to the general manager, W. J. Mead, and has been designated to oversee the business in New England, with headquarters in Boston.

George Braithwaite, for several years factory manager for the Stevens-Duryea Co., has been appointed master mechanic of the Thomas B. Jeffery Co., of Kenosha, Wis. He will devote himself particularly to the work of parts machining, on the accuracy of which the Rambler makers plume themselves.

W. McK. White, advertising manager of the Premier Motor Mfg. Co., of Indianapolis, has resigned that office to take a place in the advertising department of the United States Motor Co., in New York. Before going to the Premier company, White had been in the newspaper business and had worked with Alfred Reeves, now sales manager of the United States Motor Co., in the conduct of the Grand Central Palace show in New York.

Rebates that Reciprocity Will Bring.

Secretary Knox has submitted to the Senate finance committee an analysis of the Canadian imports that are in any way affected by the pending reciprocity agreement, during the last fiscal year, which, for Canada, ends March 31, 1911, and from that it appears that the duty has been mutually lowered on automobiles, of which, during the past year, 3,186 were imported into Canada from the United States at a total value of \$3,829,435, and on which the total amount of duties collected amounted to \$1,340,302.25, of which, under the pending arrangement, \$191,471.75 would be remitted. In addition, there were importations of automobile parts to a total value of \$494,264, on which the duty amounted to \$172,992.40, of which, under the pending arrangement, \$24,713.20 would be remitted.

ORDERS RATE REDUCED ON PARTS

**Interstate Commerce Commission's Decision
Affects Shipments to California—
Defines Reasonable Rate.**

Late last week the Interstate Commerce Commission handed down a decision ordering the Chicago, Milwaukee & St. Paul Railway Co. to reduce its rate on carload shipments of automobile parts from \$3 per 100 pounds to \$1.90 between Milwaukee and Los Angeles, the language of the decision being such that although only these points are immediately affected, it justifies the belief that a general reduction in the rate on such shipments is easily possible if the effort to obtain it is made.

The Commission's decision grew out of the complaint filed with it by the Auto Vehicle Co., of Los Angeles, Cal., against the C., M. & St. P. R. R., in which it was alleged that unreasonable charges were exacted for the transportation from Milwaukee to Los Angeles of two carloads of metal machinery to be used in the construction of automobiles, on which a rate of \$3 per 100 pounds was charged, whereas the complaint claimed that \$1.60 would have been a reasonable rate.

These shipments consisted of rear axles, front axles, clutches, sockets, brake rods and connections, buffers, forks, bushings, rear hubs, front hubs, bolts and nuts, radiators, hoods, frames, cone clutches, propeller shafts, foot pedals, fore and aft connections, steering gear and fenders. The invoice price for the first shipment was \$7,987 and for the second \$10,567.50. The parts were assembled into finished automobiles at the Los Angeles plant, where it performed the final process of manufacture.

The rate of \$3 was a less-than-carload rate assessed under item in Western Classification No. 44, I. C. C. No. 2, which reads as follows:

"Automobile parts: Metal parts, consisting of fly wheels, sprockets, crank shafts, cylinder heads, chains, brakes, drums and shoes, springs, cylinders, connecting rods, axles, and boilers, boxed or crated, first class. Metal parts, n. o. s., boxed or crated, first class."

No carload rate is provided for automobile parts by the Western Classification, and the first class less-than-carload rate was applicable under Rule 7 of the classification, which provides that "when rate for which is given will govern regardless of carload is not named the classification quantity."

Two arguments were put forward by the complaint; first, that the rate lawfully applicable was \$1.60, because the classification provided Class A rating upon machinery n. o. s. in carloads, minimum weight 24,000 pounds; second, that the rate

assessed was unreasonable in comparison with rates prevailing on other classes of machinery.

The Commission holds that as to the first contention complainant is in error. Even assuming that the consignment could have been reasonably described as machinery for transportation purposes, the fact that it is specifically described in another part of the classification renders improper the application of a rate limited to machinery, not otherwise specified.

On the other hand, it holds that the second contention is well founded. The transcontinental tariff in effect when the shipment moved provided a rate of \$3 on automobiles and parts, with a minimum carload weight of 12,000 pounds. Evidence was given to show that application had been made and denied for carload rating on automobile parts, on the ground that they had always considered that the parts of an automobile were not properly a carload commodity; that if the rate were to be reduced on a part it would simply reduce the rate on the completed article, because they could knock them down and ship the separate parts at a lower rate.

The commission holds that the complainant has a right to demand transportation at a reasonable rate and that requirement cannot be denied because of the carrier's preference to the form in which the traffic shall be moved.

Taking into consideration the carload rates voluntarily established by the carriers on machinery and parts thereof, the Commission states that it sees no reason why they should not have established a carload rating upon automobile parts, and they are of the opinion that the tariffs are unreasonable on account of their failure to do so. It assumes from the invoice prices shown in the record that the automobile parts are more valuable per carload than many of the articles to which the class A rating is applied; but making allowance for the difference in value the Commission is still of the opinion that the fourth class rate of \$1.90 per 100 pounds on a minimum weight of 24,000 pounds would have afforded the carriers a reasonable compensation for the service which they performed.

Therefore the Commission finds that the rate exacted for the shipments in question was unreasonable to the extent that it exceeded a rate of \$1.90 per 100 pounds, and has awarded reparation with interest at six per cent., in the first instance from June 11, 1908, and in the other from December 18, 1908. The carriers are also ordered to establish on or before September 1, 1911, and to maintain in force for a period of two years thereafter, a rate from Milwaukee to Los Angeles on automobile parts, not in excess of the contemporaneous fourth class rate at a minimum carload weight which shall not be in excess of 24,000 pounds.

Detroit, Mich.—United States Motor Castings Co., under Michigan laws, with \$6,000 capital.

Detroit, Mich.—Foster Motor Sales Co., under Michigan laws, with \$20,000 capital; to deal in automobiles and other motor vehicles.

Detroit, Mich.—General Motors Export Co., under Michigan laws, with \$10,000 capital. Corporators—Thomas Neal, Gleason Murray, O. G. Bennett.

Louisville, Ky.—The Glenn Bauer Motor Co., under Kentucky laws, with \$20,000 capital; to deal in motor vehicles. Corporators—W. F. Glenn, Charles H. Bauer, W. Godfroy.

Vancouver, B. C.—Consolidated Motor Car Co., under Canadian laws, with \$1,500,000 capital; to deal in motor vehicles. Corporators—Thomas Bilyeu, A. L. MacLead, Will Lanning.

Payette, Ida.—The Arnould Automobile Co., under Idaho laws, with \$5,000 capital; to deal in automobiles and accessories. Corporators—George L. Marion, F. Arnould, Alice Arnould, all of Payette.

Rutland, Vt.—Central Garage Co., under Vermont laws, with \$15,000 capital; to deal in motor vehicles. Corporators—Moses H. Farrar, Waldo H. Farrar, Louis Emmons, Ernest Dillon, all of Montpelier, Vt.

East Cleveland, Ohio—The Windermere Garage Co., under Ohio laws, with \$10,000 capital; to deal in automobile supplies. Corporators—W. H. Atkinson, M. J. Miller, K. F. Leet, O. F. Downes, R. A. Lang.

Cleveland, Ohio—The Maclaren Co., under Ohio laws, with \$10,000 capital; to deal in automobile accessories. Corporators—Don P. Miles, Harry H. Hamilton, W. R. Godfrey, M. Marquard, R. W. Sanborn.

New York, N. Y.—American-Marion Sales Co., under New York laws, with \$100,000 capital; to deal in automobiles and other motor vehicles. Corporators—James I. Handley, Charles E. Riess, George R. Morris.

Ridgway, Pa.—The Crown Gasoline & Oil Co., under New Jersey laws, with \$200,000 capital; to manufacture gasoline, operate oil wells, etc. Corporators—A. A. Urman, R. B. Thompson, G. C. Trask, all of Ridgway.

Lancaster, Pa.—Eagle Taxicab Co., under New York laws, with \$50,000 capital; to operate a taxicab and automobile livery service. Corporators—W. G. Pope, R. E. Topping, E. T. I. Thygeson, all of New York City.

Akron, Ohio—The Akron Taxicab and Transfer Co., under Ohio laws, with \$30,000

capital, for the transportation of passengers. Corporators—Charles E. Mills, Harry B. Rosston, Robert Henry, William M. Webb, Fred C. Dibble.

Ithaca, N. Y.—Barr Brothers Hardware Co., under New York laws, with \$30,000 capital; to manufacture and deal in hardware and automobile supplies. Corporators—F. C. Barr, J. M. Chase, W. G. Cobb, all of Ithaca.

Cincinnati, Ohio—The Elmwood Auto Top & Supply Co., under Ohio laws, with \$50,000 capital; to manufacture tops for vehicles. Corporators—Freddie A. Lee, J. P. Anderson, Estrella Anderson, Raymond A. Nessel, Fred. Schanzel.

New York, N. Y.—Manhattan Motor Wagon Co., under New York laws, with \$30,000 capital; to deal in and lease motor vehicles, conduct a livery service, etc. Corporators—Fred J. Galvin, New York City; Egbert Heiderich, Maywood, N. J.

New York City, N. Y.—American-Marion Sales Co., under New York laws, with \$100,000 capital; to manufacture and deal in vehicles of all kinds. Corporators—J. I. Handley, of Indianapolis, Ind.; Charles E. Riess, G. R. Morris, of New York City.

Chicago, Ill.—Langer Auto Castings and Foundry Co., under Illinois laws, with \$7,000 capital; to make castings of iron, aluminum, copper, lead, etc., for automobile parts. Corporators—Conrad P. J. Langer, Joseph Van Creanenbroeck, John Holland.

Clarksburg, W. Va.—Motor Transfer Co., under West Virginia laws, with \$10,000 capital; to conduct general storage, livery and transfer business and deal in motor vehicles. Corporators—Charles N. Slater, H. B. Douglass, Edwin Flory, L. C. Hetrick, C. B. Stout, all of Clarksburg.

New York City, N. Y.—Ashton, Laird & Co., under New York laws, with \$25,000 capital; to manufacture motors, motor vehicles, engines, welding apparatus and all kinds of vehicles. Corporators—W. E. McDonnell, E. R. Rosenbaum, A. B. Malcomson, all of New York City.

Detroit, Mich.—Johnson Bearing Co., under Michigan laws, with \$100,000 capital; to manufacture and deal in bearings and parts of engines, automobiles, etc. Corporators—Charles O. Johnson, Hugh T. Wilson, William H. Dorney, William R. Anderson, Frederick H. Mason and Louis C. Stanley, all of Detroit.

Increases of Capital.

Flint, Mich.—W. A. Patterson Co., from \$200,000 to \$330,000.

Detroit, Mich.—Cross Gear & Engine Co., from \$20,000 to \$80,000.

Akron, Ohio—Swinehart Tire & Rubber Co., from \$400,000 to \$800,000.

Detroit, Mich.—Russel Wheel & Foundry Co., from \$500,000 to \$750,000.

Adolph Lewisohn is building a two-story garage, 121.8 x 78 feet, at Auburn avenue and 158th street, New York City.

James N. Wright has begun the erection of a garage on Gilpin street, between Third and Fourth streets, Denver, Colo.

The White Co. has established a branch in Indianapolis at 510-512 North Delaware street. It is in charge of O. E. Lucore.

V. L. Rogers, Jr., is building a garage 50 x 150 feet, in Memphis, Tenn. It will have entrances on both Monroe and Marshall avenues.

The Speedwell Motor Co. is erecting a new building in Portland, Oreg. It will occupy a lot 100 x 100 feet at Fourteenth and Church streets.

P. H. Carroll is erecting a garage at Main and State streets, Waterbury, Conn. It will be two stories high and will accommodate 100 automobiles.

In Fort Wayne, Ind., work has commenced on a modern fireproof garage for the Fort Wayne-Auburn Automobile Co. It will represent a cost of \$17,000.

Arthur C. Smith has been appointed receiver for George Zisch, doing an automobile business at 960 Springfield avenue, Newark, N. J. Liabilities, \$3,500; assets, \$2,500.

Lester M. Dull, for several years identified with the Parry interests, has secured the agency of that car for California and Arizona, establishing his headquarters in Los Angeles, Cal.

The Whiting Motor Co., of New York, distributors of Mercer and Cunningham cars, have opened a branch in Newark, N. J., at 38 William street. It will be managed by N. H. Sloan.

Henry Schwartz has purchased the interest of L. J. Reminton in the Fon du Lac Auto & Tire Co. He will continue the business under the old title in the Wisconsin town of that name.

The Western Tire & Specialty Co., in which G. H. Fralick is the prime mover, has commenced business at 127 North Market street, Wichita, Kan. It will deal in tires and accessories exclusively.

George K. Wadsworth, former auditor of the Olds Motor Works, has acquired an interest in the Motor Tire & Repair Co., 6506 Euclid avenue, Cleveland, Ohio, of which he has become general manager.

Charles F. Spooner has disposed of his interest in the Hokanson Automobile Co., Madison, Wis., to the Hokanson brothers

and George P. Miller. Spooner was superintendent and a director of the company.

The big garage of the Mt. Pleasant Auto & Machine Co., in the Tennessee town of that name, has been opened to the public. It is run in connection with the machine works and will be in charge of D. G. Horton.

J. M. Hardy, of Sumter, S. C., having obtained the State agency for the Ohio car, has organized the Ohio Sales Agency Co. of South Carolina. Salesrooms will be established at Liberty and Sumter streets, in Sumter.

Gilbert C. Bensinger, long identified with the livery business in Washington, D. C., has entered the automobile trade on his own account. He has been made agent for Maryland and the District of Columbia for the Ohio car.

W. F. Shiek and B. L. Barta, under the firm name of Shiek & Barta, have opened a garage and repair shop in Waterloo, Iowa. It is located at 400 and 402 Fifth street, West. A complete line of automobile accessories will be carried.

A garage, 75 x 120 feet, will be erected at Riverside avenue and Jefferson streets, Spokane, Wash., for W. E. Miller. It will be operated in connection with the Dayton Automobile Co., 1016 Ide street, of which Miller also is the owner.

E. B. Wilson has taken the California agency of the King car and will embark in the business in Los Angeles. For many years Wilson was connected with the National Cash Register Co., most of the time as its Western distributor.

The Shepherdstown Garage Co. is erecting a modern fireproof garage in Shepherdstown, W. Va. The structure will occupy a lot on Main street 100 x 200 feet, and have a capacity for storing 100 cars, in addition to a repair shop and salesrooms.

The Kopmeier Motor Car Co. has broken ground for an addition to its garage at 375 to 389 Summit avenue, Milwaukee, Wis. It will be a separate building 150 feet square, of concrete construction, with steel truss roof, and will cost when complete, \$35,000.

H. A. Lahr and John Flanigan are building a garage on Cherokee avenue, Bartlesville, Okla. They also have announced their intention of starting a gasoline "war" by handling it in carload lots and selling at 15 cents a gallon, while the present price is 20 cents.

The Firestone Tire Co. has leased half of the unfinished building at Compton ave-

nue and Locust street, St. Louis, Mo. The structure, which occupies a lot 85 x 135 feet, is being erected by J. J. Shea for the exclusive use of firms dealing in automobile accessories.

Bentonville, Ark., is to have a \$10,000 automobile salesroom, garage and repair shop. It will be the largest building in Northwest Arkansas devoted to automobiles, and is being erected by W. E. Ammons, J. J. Jones and C. B. Bolton, all of Summer, Miss., which is across the state line from Bentonville.

Fred B. Marson, formerly manager of the Frank Fickling Co., Washington, D. C., has been appointed manager of the District of Columbia branch of the Century Tire Co. John Cashman, who has been acting manager for several months, has gone to Pittsburg, Pa., to take charge of the Century Tire Co.'s branch in that city.

The Bangor Motor Co., which has sold its garage to the city of Bangor, Me., for a central fire station, is erecting a new building of twice the size of the old one, on Main street, which will be ready for occupancy by October 1. The new building will have 46,000 feet of floor space, be two stories high and of concrete, fireproof construction.

The Republic Rubber Co., of Youngstown, Ohio, has commenced the erection of a Pacific Coast branch in San Francisco, at the corner of Hyde and Golden Gate avenues. It will be a two-story and basement pressed brick structure, 70 x 137 feet, and will be ready for occupancy about September 1, at which time M. E. Murray will assume charge, with the title of general western manager.

Recent Losses by Fire.

Philadelphia, Pa.—Charles Schroeder's garage damaged. Loss, \$1,500.

Blairsville, Pa.—Thomas Kerr's garage destroyed. Contents included four cars.

Newark, N. J.—F. L. C. Martin Automobile Co.'s garage, 282 and 284 Halsey street, damaged. Loss, \$2,000.

Mexico City, Mex.—E. N. Brown's garage, Calle de Merida, No. 21, completely destroyed. Contents included four cars and accessories. Loss, \$25,000.

Milwaukee, Wis.—Henry A. Keech's garage, 726 National avenue, burned; six cars and other contents damaged. Loss, \$2,000.

Davenport, Iowa.—P. F. McCarthy's garage, 942 Marquett street, burned; one car and other contents destroyed. Loss, \$10,000.

500 MILES IN 442 MINUTES

THE AMAZING RECORD OF A MODEL CAR

STUTZ DESIGN

A signal triumph for an American designer was the wonderful showing made by the first Stutz car ever built, and entered in the 500-mile International Sweepstakes on the Indianapolis Speedway, May 30th, 1911.

The first Stutz car ever built, but by no means the first car ever built by Harry C. Stutz, was matched against the skill of the best engineers of two continents, many of whom have been working on a single design of car for years, and he made good.

STUTZ CONSTRUCTION

The Stutz car went through the race without a mechanical adjustment, without a relief driver, and averaged $68\frac{1}{4}$ miles per hour for the entire distance of 500 miles, including 13 stops for tires and fuel, surely a marvelous performance—500 MILES IN 442 MINUTES without the least sign of trouble, and after the race, when the car was taken down, part by part, to find out if any weakness whatever had developed in the mechanical construction, we found absolutely nothing we could do to make the car any better.

STUTZ PERFORMANCE

Surely this was the most gruelling test ever given a model car. Mr. Stutz built the car from the ground up in five short weeks, entered it in the greatest race ever run in the history of mo-

tordom and staked his reputation that it would make good. The result more than justified his judgment, and well may a buyer of a motor car repose confidence in the product of such a designer and engineer.

STUTZ QUALITY

The Stutz car entered in the 500-mile race was absolutely a stock car and not a special racer. We are building duplicates of the car entered in this race, in every part of which we use the best material known to man for the work it is to perform. Our claim is that it is not possible for anyone, no matter what price he asks for his car, to build a better motor car than the Stutz. A comparison of our specifications with those of other cars will convince the most skeptical that the time has come when an automobile buyer can purchase a car constructed throughout of the very finest material and workmanship at a moderate price.

STUTZ RESULTS

Duplicates of the car that went 500 miles in 442 minutes without a single mechanical adjustment can be bought for \$2,000. We are making the Stutz car in three types: roadster, four-passenger and five-passenger. The finish and equipment of these bodies is the best that money and skilled workmanship can produce.

We still have some excellent territory open for live dealers.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, JULY 13, 1911.

Misapplying the Term "Fore-door."

As the touring car equipped with front doors as well as rear ones has become the rule, and the open-front car the exception, and as few, if any, of the latter are likely to be listed in the 1912 catalogues, is not the time auspicious to abandon the various designations, "closed-front," "fore-door," "four-door," which have been employed to distinguish the car which had both front and rear doors? To remark the obvious usually is not considered good form and to continue the use of the terms will be almost as bad as stating that touring cars have front and rear seats. It is rather odd, too, that no one ever calls the front seat a "fore seat," or the rear one an "aft seat."

On this subject, the growing tendency to apply the designation "fore-door model" to two-passenger runabouts and roadsters which have been provided with doors, which is discernable in several of the preliminary 1912 announcements, ought to be

checked forthwith, not wholly as a matter of good form but because it is such a manifest and even absurd misapplication. How can a type of car which of its very nature cannot have either or both front doors or rear ones properly be styled a "fore-door model"?

New Theory of Carbon Deposits.

Since the motor world was startled by the revelation that carbon deposit, so-called, was composed in some measure of dust of the common or garden variety, but little has been added to the theory of the subject. That was several years ago, and since that time motorists have gone on patiently chipping away the hardened accumulations from piston and cylinder wall surfaces, squirting liquid preparations into their engines or dropping in short lengths of chain in the hope that by such means they could rid themselves of the heavy encrustations. Nor have they uttered so much as a single protest at the makers' indifference to their interests exhibited by their neglect to provide screens for the carburettor orifices.

It has been recognized that some engines were "clean" engines while others were "dirty," in the sense that they quickly become foul, but that distinct provision might be made on the part of the designer to render an engine clean running throughout its life is an idea that seems never to have gained a foothold—at least not in the right quarters.

A very recent contribution to the science of motor design is that of an investigator who has developed a theory as to the "growth" of the encrustation in question. Carbon deposit, he believes, "grows" very much as coral formation grows, the animalculae being omitted from consideration in this case, as a matter of course. For example, according to the new theory, a leaky valve in permitting a very minute volume of gas to escape serves to cool the escaping increment by reason of the large area of cooling—that is to say, heat conducting—surface in proportion to the volume of vapor passing. Such cooling action, it is held, even though infinitesimal in amount, is sufficient to cause a minute quantity of oily and carbonaceous matter to be deposited about the edges of the orifice. Any liquid or solid particles of carbonaceous matter that may be drawn to the opening likewise will be retained by mechanical action, as in the meshes of a strainer.

This, in a word, is held to explain the origin of the deposit in many cases. Thereafter it is believed that liquid and incandescent particles of carbon are more readily caught by surfaces which already are partially encrusted than by those that are clean, the crust thus spreading over adjoining surfaces in a manner analogous to actual organic growth. Leaky valves or valve caps and valves which have a very gradual opening and closing action, and so permit "wire drawing," thus are apt to prove the nuclei for the formation of deposits that ultimately embrace the entire permanently exposed cylinder surfaces.

Certain it is that oil will adhere more readily to a rough than to a smooth surface and that it will burn from a smooth surface more completely than from a rough one merely because of the uniform thickness of the film in the former instance. In the absence of destructive criticism the theory in its entirety seems worthy of attention. It long has been understood that an engine fitted with cylinders with interiors machined throughout would tend to run cleaner than one in which the customary rough metal was exposed in the head surface. With poppet valve design finished cylinder interiors usually are out of the question, but such is not always the case with rotary and slide valve designs. That the near future may afford practical opportunities for testing the correctness of the theory aforementioned, therefore, is far from unlikely. Obviously the question is one the designer no longer should permit himself to ignore.

Importance of Truck Operating Costs.

It is a matter for congratulation that the motor truck industry is beginning to arouse to the importance of studying operating costs on a scientific basis. It cannot be said that the question has been put off for too long a time, because, in the natural order of things, operation is sequent to creation, and the problems of design hitherto have been all-absorbing. The time is fast approaching, however, when even the manufacturers themselves will need to know more about commercial vehicle operation than their own researches or their own road tests will tell. The separating of vehicles into classes according to the requirements of different services, the refinements of design and the development of broadest economy are subjects that can be attained only by checking the designer's theories against

actual service, prolonged over long periods and spread over wide areas.

At the same time it is just as well to put the cost question in the right pigeon hole before it is carried any further. There is no need to imagine for a moment that truck costs ever will become an absorbing topic for discussion outside technical circles or that the average business man will consent to pay very close attention to the way in which they are obtained. For centuries horse owners have gone on measuring out oats and plying the whip without thought of the percentage or ton-mileage of return on the equine investment. Even the modern teamster who has grafted a few ideas about business economy has a very poor notion as to what horse-haulage really costs. Nor is there good reason to hope that his conversion to motor traction will render him a very much better economist. His education will progress to a point just short of keeping accurate detailed operation records, and there it will stop.

Not so with the large operator of trucks—the motor transportation agent of the future. As in railway operation and all mechanical undertakings conducted on a large scale, the handling of numbers of commercial vehicles can be carried on profitably only when every item of expenditure is cut down to a minimum and when every avenue of income and outflow is closely and intelligently watched. Like the manufacturer, the wholesale user of trucks is in urgent need of authentic working data. Such as he can compile from his own experience he will make good use of and such as he can obtain from other sources he will weigh and employ or condemn, according to its trustworthiness and applicability. Cost data will become as much a part of his equipment and as much a guide to its administration as the rolling stock itself or the experience of his superintendent. The small user, on the other hand, may be expected to worry along in just about the same old way, content, so long as he gets the right kind of a balance at the end of the year, not to inquire to what train of circumstances he is indebted for it.

This does not mean that the cost question is not worthy of study and development; merely that it is hopeless to attempt to reduce it to a popular diet, and needless to overburden or frighten the unsophisticated "prospect" with its intricacies. For the ambitious student of automo-

bile problems there can be no line of more pertinent investigation than that of motor transportation costs. It is a most hopeful symptom that a movement to accumulate reliable information on the subject already is under way. But when it comes to the man who does not know the calorific value of a forkful of hay, or who never has attempted to ascertain the heat balance of the horse, it is as futile to talk cost theory as it would be to attempt to interest a beginner in arithmetic by explaining the binomial theorem. The man who thinks only in terms of results, whom the world deems a "practical" man, will be satisfied if truck economy can be shown otherwise than in mathematical terms. That it can, whether in one, or two, or twenty truck installations is certain.

"Sour Grapes Raised by Barney Oldfield," is not but ought to be the title of a series of articles bearing Oldfield's name which now is appearing in print in a daily paper that appears anxious to exchange good money for spoiled print. Having defied established authority and paid the inevitable result of being a sporting outcast and having sold his racing cars for a good round sum, Berna—which is Barney's

real name, now is condemning and making faces at about everyone and everything that helped him earn an easy living for so many years. His indignation regarding the use of horse tracks, his righteous wrath provoked by professional promoters—"barnstormers," he himself now calls them—his withering condemnation of professional officials—oh! it all is so conscientious and so perfectly dreadful that it must cause a snicker wherever it is read, except perhaps in the newspaper office where he receives payment for such twaddle. "Why," for instance asks the delightful Berna, "should a few professional promoters be allowed to schedule semi-weekly 'meets' in which their own cars compete against a few locally owned cars in the different cities visited?" Indeed it is Berna that asks the fateful question. Think of it! Berna—Berna Oldfield asking such a question; and with "Bill" Pickens still at his elbows helping sign Berna's name to such articles and doubtless getting his share of the "easy money" for doing so! It's tough to be an outlaw, but as Oldfield probably has heard the sour grapes fable, if he can cease chuckling long enough to do so, Pickens ought to relate to him the story of the dog in the manger.

LAMPS FOR ALL IN THE BAY STATE

New Law Requiring Them Becomes Effective Next Sunday—Does Not Apply on Lighted Streets, However.

On and after Sunday next, 23d inst., "every vehicle on wheels" used in the State of Massachusetts must display a lighted lamp, visible from the front and rear—unless the vehicle happens to be on a lighted street or highway, unless it is loaded with hay or straw or unless the owner of the vehicle happens to be possessed of a special written dispensation issued by the Massachusetts Highway Commission. Motor vehicles, however, are not included in these "unlesses." After nightfall they must continue to display lights under any and all conditions; but despite the fact their owners will not be inclined to quarrel with the new law which becomes operative on Sunday next. It represents the fruits of several years' effort on the part of the American Automobile Association, which until the last session of the Massachusetts legislature was defeated by the outcries of farmers, real and political, who could not understand why they should be subjected to the expense and inconvenience of carrying lamps simply to prevent accidents.

The full text of the new law, which constitutes Chapter 578 and is entitled "An act to require certain vehicles to carry lights at night on public highways and bridges," is as follows:

"Sec. 1. Every vehicle on wheels whether stationary or in motion, on any public highway or bridge, shall have attached to it a light or lights which shall be so displayed as to be visible from the front and the rear during the period from one hour after sunset to one hour before sunrise; provided, however, that this act shall not apply to any vehicle while upon any lighted street or highway where street lights are maintained at a distance of five hundred feet apart or less, or to any vehicle designed for the transportation, as its principal freight, of hay or straw while loaded with such freight.

"Sec. 2. Upon the written application and presentation of reasons therefor by the owner of a vehicle, the Massachusetts highway commission may, in writing, in such form and subject to such requirements as it may elect, and without expense to the applicant, exempt said vehicle from the provisions of this act for such period of time as said commission may elect.

"Sec. 3. Any person who, while driving or in charge of or occupying a vehicle, during the period from one hour after sunset to one hour before sunrise, shall refuse, when requested by a police officer, to give correctly his name and address, shall be punished as provided in section six of this act.

"Sec. 4. Nothing contained in this act shall be construed to affect the provisions of any existing statute, rule or regulation requiring lighted lamps on motor vehicles and the obligations of operators or occupants thereof.

"Sec. 5. The driver or custodian of a vehicle shall be deemed to be the responsible party and liable to the penalty as provided in this act for a violation thereof.

"Sec. 6. Any person violating the provisions of this act shall be subject to a fine not exceeding five dollars."

Omaha "Drummers" in Endurance Contest.

Eleven automobilists left Omaha, Neb., Monday morning, 10th inst., in an endurance contest which in its way is unique, in that the contestants all are salesmen of the Omaha Rubber Co., and each drives his own car. The cars have been in use for more than a year, as these knights-of-the-road find traveling by automobile much more advantageous than the railroads. Each man thinks his machine the best, although some drive runabouts and others have large touring cars, and in order to let them settle their arguments, their employer gave the men a week's vacation and arranged an itinerary, which includes all the principal towns in Western Idaho and Eastern Nebraska in which the company does business. A time limit has been set for the arrival in each of the places on the itinerary. Each day's trip will average about 160 miles in 12 hours' travel. During the six days 94 towns will be visited. As the Omaha company handles United States tires, it is easy to guess what tires the salesmen are using.

Norristown Racemeet is Abandoned.

The racemeet which was to have been held on July 8, under the auspices of the Norristown Automobile Club, on the Belmont track in Philadelphia, Pa., has been abandoned. Though the promoters were thoughtful enough to anticipate the possibility of rain and in the entry blanks provided for a postponement until the 15th inst. if J. P. should intervene, they exercised a greater prerogative in calling the whole affair off entirely. Though no particular reason for the abandonment is given, it is probable that lack of entries was the principal cause.

Henry County Motorists Organize.

The Henry County Automobile Association is the style of an organization which was formed last week in Clinton, Mo. The officers for the first year are: President, E. T. Montgomery, of Clinton; vice-president, G. W. Schweer, of Windsor; second vice-president, S. B. Osborn, of Deepwater; secretary, Will A. Dougherty, of Clinton; treasurer, John Bowen, of Windsor; press representative, John Smith, of Clinton; directors, C. J. Keil, Clinton; J. Miller, Ulrich; A. Wally, Montrose; J. W. Gallihugh, Blairstown; George Woods, Deepwater.

STATUTE IS UNCONSTITUTIONAL

Appellate Division Decides Motorists Cannot be Required to Notify Police of Accidents—Two Judges Dissent.

In New York State, at least, no motorist will have to bear witness against himself. This is the opinion of the majority of the judges of the Appellate Division of the Supreme Court, in the case of Edward T. Rosenheimer, who had been indicted for an alleged violation of the Callan law. It will be recalled that Rosenheimer was tried and acquitted on the charge of the murder of Grace Hough, who was killed by being thrown from a buggy with which Rosenheimer's car collided on Pelham Parkway, New York, on the night of August 18, 1910. Afterwards he was indicted under the Callan law, which makes it a felony punishable by a \$500 fine or two years in prison to fail to stop after an accident and give name and address to the police.

Immediately after the indictment a demurrer was presented by Rosenheimer's lawyer, James W. Osborne, who contended that the statute under which Rosenheimer was indicted was a violation of Section 6, Article 1, of the State Constitution of New York, which provides that no person shall be compelled in any criminal case to be a witness against himself. Osborne maintained that compelling a motorist to return after an accident and give his name and address was equivalent to forcing him to testify against himself, and that the law requiring it was therefore unconstitutional. This view was accepted by Justice Crain, of the Supreme Court, who dismissed the indictment in April last. The district attorney, however, carried the case to the Appellate Division, which, by a divided vote last week, sustained the opinion of Judge Crain, Justices McLaughlin, Loughlin and Dowling voting to sustain the lower court, and Presiding Justice Ingraham and Justice Miller dissenting. In his dissenting opinion Justice Ingraham holds that the statute does not relate to a criminal action, nor does it make the declaration of the person operating the automobile admissible evidence in criminal actions.

"The use of these motor vehicles has created a new condition, in which, those using the streets are subjected to serious dangers," he adds. "The Legislature, to protect the citizens, has made it the duty of the one causing the accident to stay at the place of the accident and give proper notice to the police. Certainly common humanity would impose such a duty, and I cannot believe that a statute which imposes and enforces it would violate the Constitution of this State."

The district attorney has entered an appeal and will have the Court of Appeals pass on the point.

DAVENPORT SEES DOUBLE DOINGS

Hill Climb in the Morning, Racemeet in the Afternoon—Peterson Family Acquires Most Prominence.

The natives of Davenport celebrated a "safe and sane" Fourth this year, though there was not the remotest possibility of their suffering from ennui as a result; there were no less than two automobile race-meets in that Iowa town on Independence Day. Or rather, there was one racemeet and one hill climb—which is just a little bit more automobile speeding than even a city of the first class might expect in the course of a single day. The racemeet was held in the afternoon under the auspices of the Tri-City Speedway Association on the Tri-City Speedway, which is nothing more than an abandoned horse racing track, and the hill climb was held more or less in the city streets, with the Davenport Automobile Club as its sponsor. The hill climb was not sanctioned by the American Automobile Association, a sanction being unnecessary, as the affair was closed to members of the club.

Though there was practically no policing of the course over which the hill climb was run, which was approximately one-third of a mile in length, and the populace at large swarmed over it at will, winners were evolved in four classes without accident; the judges still are busily figuring out who won the other two classes. The fastest time made on the hill is credited to A. C. Peterson, who drove a Pope-Hartford up the incline in 17 seconds. It has not been decided whether this time will be allowed, however, as it was made in Peterson's second trial. The winners who have been officially announced are as follows:

Class 1, cars costing less than \$1,000—Won by G. H. Knowles (Overland), 28 $\frac{3}{4}$ seconds; second, Wm. Roeske (Ford), 29 $\frac{1}{4}$ seconds.

Class 3, fully equipped cars costing from \$1,500 to \$2,500—Won by C. S. Pope (Midland), 23 $\frac{1}{4}$ seconds; second, W. L. Velie (Velie), 25 $\frac{1}{4}$ seconds.

Class 4, fully equipped cars costing over \$2,500—Won by Walter Priester (Pope-Hartford), 23 $\frac{3}{4}$ seconds.

Class 6, handicap for age of car (handicap not yet decided)—Won by Dr. Karl Vollmer (Pope-Hartford), 24 $\frac{1}{4}$ seconds.

But part of the so-called Speedway had been oiled for the racemeet, which was held in the afternoon, and as a result the great clouds of dust and the poor condition of the track in general precluded the possibility of fast time being made. Pete Peterson, who drove a Pope-Hartford most of the time, though his first mount was a Hudson, with which he won the curtain raiser easily, was the principal performer.

In addition to the race for cars in the "baby class," he also accounted for the one mile free-for-all and was second in both the five miles event for cars costing from \$1,601 to \$2,000 and the ten miles free-for-all. The summary:

Five miles, class C, division 2C—Won by Pete Peterson, Hudson; second, W. E. Roeske, Ford; third, E. J. Dillon, Hupmobile. Time, 6:09.

Five miles, class C, division 3C—Won by M. C. Armstrong, Colby. Time, 7:06 $\frac{3}{4}$.

Five miles, class C, division 4C—Won by A. Burt, Buick; second, Pete Peterson, Pope-Hartford; third, Hall, Midland. Time, 10:48 $\frac{1}{4}$.

Fence Suffers at Kansas City Meet.

Though they were sandwiched between an equal number of motorcycle races, the four automobile races which were decided on July 4th at the Elm Ridge track, which is in Kansas City, Mo., were considerably more than half the show, contributing as they did by far the greater part of the afternoon's thrills and excitement. The original plans of the Kansas City Automobile Dealers' Association, which organization was responsible for the meet, included six automobile races, but owing to lack of entries, two of them, one at five miles for small stock touring cars and another at 10 miles for stripped racing cars in the 600 inch class, were scratched.

The track was in very bad condition; dust arose in tremendous clouds and before a very great time had elapsed the soft earth at the turns had become so badly cut up that accidents were avoided by miracles. In fact several of the cars did go through the fence, though none of the contestants were hurt seriously. No particularly fast time was made in any of the events, and in practically every instance they were won easily. A fifty miles free-for-all was the feature event of the day and it brought out a field of nine starters. By the time the half-way mark was reached, however, the drivers of two Warren-Detroits, a Cino, a Cole and a Velie had withdrawn, and thereafter Ralph Ireland, who had the mount on an Inter-State, had things pretty much his own way. He won in 56:50.03, with W. H. Pearce (Fal), Frank Sloan (National) and Gus Monckmeier (Staver-Chicago), second, third and fourth, respectively. The summary:

Ten miles, class C, 231-300 inches displacement—Won by Edward Raimy, Cino; second, W. H. Pearce, Fal; third, Gus Monckmeier, Staver-Chicago. Time, 10:33.04.

Five miles for private owners—Won by Jack McLean, Velie; second, Edward Potts, Cole. Time, 5:38.64.

Ten miles free-for-all—Won by Ralph Ireland, Inter-State; second, W. H. Pearce, Fal; third, E. Raimy, Cino. Time, 10:52.60.

Fifty miles free-for-all—Won by Ralph Ireland, Inter-State; second, W. H. Pearce, Fal; third, F. Sloan, National. Time, 56:50.03.

HOT WORK IN HIGH TEMPERATURE

Rough Road Races in San Joaquin Valley with Thermometer at 110 Degrees—Herrick and Nikrent Win.

There were some hot road races at Bakersfield, which is in the oil district of California, on Independence Day. The races themselves were not hot in the sense that they were keenly contested, however, Harvey Herrick (National) winning the free-for-all by something over two laps of the 11.15 miles course, and Louis Nikrent (Buick) having things pretty much his own way in the light car event, though everything else was anything but cool; the mercury stood at 110 degrees in the shade. It was the first time that automobiles had participated in a road race in that particular locality—the Kern County Merchants' Association was responsible for the affair—and the natives are keen for more. Whether or not they will get it, in view of the poor management, remains to be seen. Spectators ran all over the course and the so-called guards were conspicuous by their absence. In the meantime, many arguments for and against making the function an annual affair are in progress.

A good part of the course was laid in the San Joaquin valley, and it was one of the roughest over which a race ever has been run. Starting about one mile out of Bakersfield, the route led northeast through the oil region and then north about three miles, making a sharp turn over the Kern river to the base of China bluff, a tableland with a 12 per cent. grade and many sharp turns, "S," "hairpin" and otherwise, on the narrow road to the summit. Thence over a specially prepared roadway, the course led to the finish line. Notwithstanding the unusually rough, and in places precipitous, road, there were no serious accidents, though one driver, J. J. Jeffries (Buick), had a narrow escape when his car overturned; however, neither he nor his mechanic were injured seriously.

The light car race, which was the first on the program, was started at 7:30 in the morning, the following drivers and cars lining up: Glen. Packer, Ford; G. F. Weathers, Chalmers; Harry Buckley, Franklin; J. J. Jeffries, Buick; Frank Siefert, Mercer; Louis Nikrent, Buick; D. D. Phillips, Haynes. The race was slated to go 100.35 miles, or nine laps of the course, and for the first five laps, Packer, in the Ford, led the field. D. D. Phillips (Haynes) was the first to retire, carburettor trouble on the second lap putting him out of the running. He was quickly followed by Jeffries, whose Buick overturned on the fourth lap, and Siefert in the Mercer withdrew in the fifth lap because of tire troubles. From the fifth lap to the finish Nikrent held his

Buick in the lead, winning in 2:15:00 $\frac{3}{4}$. Weathers (Chalmers) was second in 2:19:44 $\frac{3}{4}$, and Packer, in the Ford, came in third in 2:44:42 $\frac{3}{4}$. None of the other drivers finished.

Of the eight drivers who were entered for the free-for-all at 156.1 miles, two failed to put in an appearance and two were scratched almost at the post, leaving the following to fight it out among themselves: Harvey Herrick, National; Bert Dingley, Pope-Hartford; Frank Siefert, Mercer; Louis Nikrent, Buick. Promptly at 11 o'clock the first of the four drivers started on their 14-lap journey, Herrick being the first to get away. Nikrent quit on the second lap when a bearing burned out in his Buick, and it then became apparent that it

BOAT'S LONG VOYAGE OVER LAND

Vandervoort Finds a Problem and Promptly Disposes of It—Boat's Launching More Novel than Its Voyage.

Not inappropriately, some automobiles have at various times been styled "boats"; indeed, amphibious boats and amphibious automobiles, are not altogether unknown. The juxtaposition of automobile and boat shown in the accompanying illustrations, however, is, to say the least, unusual. While instances where boats have been carried on automobiles are fairly common, this is the first time, as far as is known, that one of

that this time might have been cut almost in half had the roads been in even their ordinary condition. Several times it was necessary to stop and put guy ropes on the boat to prevent it from tipping over, as boat and car slipped over almost into the ditches at the sides of the road. Though the average schedule called for an average speed of 10 miles an hour, only part of the trip, the 62 miles between East Moline and Dixon, Ill., was made at that rate. As a matter of fact the schedule was beaten between those points, the running time being five hours and 55 minutes.

But as novel as was the method of transporting the boat the long distance over land, the launching was even more so. Arrived at Lake Delavan, the outfit was

HOW WEE WEE MADE ITS OVERLAND JOURNEY

THE NOVEL LAUNCHING OF THE WEE WEE

would be a duel between Herrick and Dingley. Later, however, Dingley, too, had trouble, a broken valve spring on the ninth lap causing a delay which allowed Herrick to open up a gap of two laps, and from then on to the finish line, which was crossed in 2:58:58 $\frac{3}{4}$, the race was practically without competition. Siefert, in the Mercer, also had trouble early in the race, and when the contest was called off he had covered seven laps. He got third place, his time for the seven laps being 3:16:15, and Dingley (Pope-Hartford) was second in 3:01:58. The summary:

Light car race, 100.35 miles—Won by Louis Nikrent (Buick), time, 2:15:00 $\frac{3}{4}$; second, G. L. Weathers (Chalmers), time, 2:19:44 $\frac{3}{4}$; third, Glen Packer (Ford), time, 2:44:42 $\frac{3}{4}$. No others finished.

Free-for-all, 156.1 miles—Won by Harvey Herrick (National), time, 2:58:58 $\frac{3}{4}$; second, Bert Dingley (Pope-Hartford), time, 3:01:58; third, Frank Siefert (Mercer), time for seven laps, 3:16:15.

The Georgia Automobile Club has been formed at Atlanta, Ga., with the following officers: President, G. W. Hanson; vice president, F. J. Long; second vice president, C. L. Elyea; secretary-treasurer, W. F. Gordon.

them has been towed and actually launched with the help of an automobile.

The boat, which is 28 feet over all and is equipped with a 35 horsepower motor, was built by W. H. Vandervoort, president of the Moline Automobile Co., at the Moline factory in East Moline, Ill., and the problem of transporting it from there to his summer home on Lake Delavan, Wis., a distance of 150 miles, was worked out in a decidedly novel manner. The bow of the boat was rigged over the rear axle of a stock model "Dreadnaught" Moline "35," equipped with standard 36 x 3 $\frac{1}{2}$ inch tires in the front and 37 x 4 inch tires in the rear, the stern of the boat being carried on an extra pair of wheels shod with 37 x 3 inch tires. The total length of the automobile and its "tow" was slightly over 36 feet and the weight of the complete outfit was 7,200 pounds.

The roads over which the boat was hauled never have been noted for their excellence, and with the advent of heavy rain which lasted a considerable part of the time, they became worse than ever. Despite the slippery clay, almost hub deep for part of the trip, and the fact that the extreme length of the outfit caused it to slew around quite easily, the entire trip of 150 miles was made in exactly 23 $\frac{1}{2}$ hours, though it is possible

simply backed into the water until the boat floated, when the lashings were taken off the bow and the extra wheels under the stern hauled to their logical place on terra firma. It is evident that "Wee Wee" rightfully is styled an "automobile" boat.

Indiana Humiliation Valued at \$5,000.

Stilesville, which is in Hendricks County, Indiana, although a village of but 357 population, has made a bid for fame, and all because a young automobilist, resident in the village, wandered over into Morgan County, and in Martinsville, the county seat, which has a population of 4,600, found a girl who enjoyed moonlight rides. When she concluded to end the ride by returning home, the Stilesville swain declined to return. The lady assured him that she was "not that kind of a girl," but it served no purpose, and when finally they did get back to Martinsville, the lady, who happened to have a husband, found herself humiliated to the extent of \$5,000. As she is a minor, the husband, as her next friend, has created quite a stir in the center of the Hoosier State by entering a suit against the gay young blade of Stilesville for that amount in the District Circuit Court. It is expected that the testimony will give two counties something to talk about.

Motor Cars that Smoke; the Causes and the Cures

"Now, your Honor, any car is apt to smoke up hill, and besides, I was only running about eight miles an hour, when this officer . . ."

"Never mind about the officer. Did, or did not, your car emit smoke while going up the 110th street hill, on the particular occasion of which we are speaking?"

"Why, I suppose it might have smoked just a little. It's just this way: When the car begins to go up grade, y'understand, your Honor, why the oil in the crank case . . ."

"Five dollars . . ."

Thus does society take toll of innocence and thus does the unsophisticated motorist

traffic squads of the New York police, hundreds of heedless motorists recently have been haled into court and made to pay the \$5 penalty for driving a smoking motor. Already a marked and two-fold effect has been manifest. In the first place the atmosphere in the vicinity of traffic-laden streets has been visibly clarified, and in the second place automobile owners have begun to evince a lively and personal interest in the lubricating systems of their engines such as never before was known.

At first a spirit of rebellion prevailed and a sentiment that a gross injustice was being done a particular and much-oppressed class of citizens. The succeeding mood was one

no need for the engine to yield a smoky exhaust. Some of them have even devised oiling systems whereby they claim smoking is absolutely prevented, while all of them are striving to secure effective lubrication without waste of oil. For if, as already has been stated, a smoky exhaust is an infallible symptom of over-lubrication, then it must follow that it is equally a sign of oil waste. Safe to say those representatives of the social system who were responsible for the anti-smoke crusade that just now is being waged in New York had no intention of enforcing oil economy on the automobile fraternity, yet such is the direct effect of their efforts.

FIG. 1—SIMPLE SPLASH LUBRICATION, CAR LEVEL.

FIG. 2—SIMPLE SPLASH LUBRICATION, CAR ON GRADE.

come to discover that gasoline, oil and tires do not constitute the only items of expense in the operation of an automobile. The only trouble is that the motorist who blushing is forced to admit that he has been "hitting it up," or that his course down the avenue has been marked by a trail of thin blue pungence, usually fails to recognize in his predicament the will of the people. Instead he is apt to confer a degree of hatred on the "cop" who happened to catch up with him or the judge who was unfortunate enough to have to listen to his faltering efforts at defense. It is the will of the people, however, though expressed in a roundabout way, it is true, that of certain specified things that shall or shall not be, the smoking automobile shall be included in the "shall nots." Such, at least, is the case in New York City, and so it may come to be elsewhere, in the larger cities and towns, as it has abroad.

Through the efforts of the health and

of extreme caution, and the result amounts to a tacit admission that, contrary to numerous allegations, smoking is not necessary to proper engine working and that it can be prevented. Further evidence in point is the action of certain of the metropolitan taxicab companies in establishing instruction classes for their chauffeurs with the object of teaching them how properly to care for their motors, how to lubricate them effectually and how to prevent over-lubrication; which is the seat of the whole smoking difficulty, generally speaking. Supplementing such instruction in one or two instances, word has gone forth that hereafter chauffeurs who are arrested for the smoking of their engines will have to pay their own fines; which amounts to an open declaration that the cab officials are of the opinion that the smoking of an automobile engine is wholly a personal offense.

As a matter of fact, automobile engineers long have been of the opinion that there is

Coming directly to the mechanical side of the question, smoke, that is to say a visible exhaust, may be due to one of three causes or to a combination of either or all of them. Ordinarily it is caused by the burning of oil in the cylinder. To be more exact, it is caused by the partial burning of oil in the combustion chamber. The truth of the matter is that, despite the intense heat of the combustion chamber it is insufficient to effect the complete combustion of the oil when it is present in great abundance, or when it is of an unsuitable grade. The smoke, therefore, is merely unconsumed carbonaceous matter, which is held in suspension in the exhaust gases. If the exhaust is permitted to impinge against metal surfaces the carbon is precipitated and a carbon deposit is formed. This is the principal source of the carbon deposits on the interior of the cylinder head, that is responsible for so much ignition trouble, it may be added. Generally speaking, oil

smoke is blue or bluish black, its color and constituency depending on the composition of the oil and on the temperature conditions within the engine.

A second source of smoky exhaust is a rich mixture, the result of which is a characteristic black smoke. This is caused when an insufficient amount of air to effect complete combustion is present in the cylinder and when, in consequence, a certain proportion of the fuel is converted into free carbon, which, in some instances assumes much the same characteristics as plain soot. Black smoke, therefore, is due ordinarily to improper carburettor adjustment and as, in addition to being absolutely needless, it is indicative of fuel waste, it is hardly to be considered as a common cause of

indicative of engine trouble and, therefore, demand instant remedying, there is no need to consider them further in looking for means of smoke prevention. It is oil smoke ordinarily that causes annoyance and which can be prevented only by observing special precautions, for, ordinarily speaking, an overabundance of oil does not immediately reveal itself in the working of the engine. Indeed, with good ignition apparatus, it is possible to run many engines for long periods with an excessive oil supply without noticeably unpleasant results. Smoking always is accompanied by carbonizing of the cylinder walls and ports, however, and if permitted to continue invariably is followed by more or less preignition trouble. It is, therefore, in the interests of the

sary only to arrange and proportion the distributive system in such a way that certain relative quantities of the lubricant will be delivered to the feeding points at all times and regardless of external conditions. It also is necessary that in respect to piston lubrication only a sufficient quantity shall be fed to ensure an ample supply of oil throughout the length of the bore without an excess being rubbed and squeezed above it into the combustion chamber. To simplify matters in advance, be it added that the problem is largely one of proper oil level regulation in the crank case. To attain this, however, is not always as simple as may appear.

In Fig. 1, of the accompanying illustrations, is suggested in outline the arrange-

FIG. 3—EFFECT OF SUDDEN START ON SPLASH

FIG. 4—HOW DAMS PREVENT OIL WASHING

smoky exhaust. Occasionally it may be due to the use of a poor grade of fuel, containing exceptional quantities of oily matter, the result being a smudge which more or less resembles the smoke resulting from overlubrication, except that it is thinner.

The third and rarest cause of visible exhaust is steam. With the high temperatures which ordinarily prevail in an engine that is working properly, of course, any water that might find its way into the cylinder in small quantities, as for instance, by entrainment in the gasoline, would be broken up into its constituents and would not retain its qualities as steam. A small crack in a water jacket surface, however, occasionally may reveal itself by delivering enough water into the cylinder or into the exhaust port to cause appreciable quantities of white or whitish vapor to appear at the end of the exhaust pipe. Naturally this manifestation is exceedingly rare. A more likely cause of steam formation is a faulty gasket under a detachable cylinder head, which permits water to leak into the cylinder.

As the two secondary causes of what the public would designate as "smoke" are in-

car owner to prevent it, entirely apart from the ethical question of atmospheric pollution.

In speaking of overlubrication it is necessary to distinguish between the requirements of different parts of the motor. Generally speaking, it is assumed by the layman that if the motor is properly lubricated in one spot the same condition prevails elsewhere. This fallacy must be dispelled at once. Overlubrication of the smoke-producing variety occurs only when excessive quantities of oil are present in the cylinder above the highest point of piston travel and, therefore, in a zone in which no lubrication is required. Except for the oozing of oil around the external ends of bearings with consequent soiling of the motor, this is the only point where an excessive oil supply in any way is to be considered injurious, but it does not follow that an excess of oil in the cylinders always is accompanied by a supply in excess of the actual requirement in other localities. The smoke question, therefore, resolves itself mainly into a question of distribution.

To attain a smokeless engine it is neces-

sary only to arrange and proportion the distributive system in such a way that certain relative quantities of the lubricant will be delivered to the feeding points at all times and regardless of external conditions. It also is necessary that in respect to piston lubrication only a sufficient quantity shall be fed to ensure an ample supply of oil throughout the length of the bore without an excess being rubbed and squeezed above it into the combustion chamber. To simplify matters in advance, be it added that the problem is largely one of proper oil level regulation in the crank case. To attain this, however, is not always as simple as may appear.

Theoretically this system works very well indeed, being also delightfully simple. Its effectiveness depends on retaining the oil at the proper level, however. Nor is this merely a question of maintaining the correct amount of oil in the case at all times, as at first might appear. When the crank case is tipped as a result of the inclination of the car on a grade, the oil exhibits a very natural tendency to run to the lower

end in seeking its own level. The effect is shown in Fig. 2, wherein it is plain to see that the rear end of the case contains too great a depth of oil, in consequence of which the rear cylinders are certain to be flooded to the point of smoking. Similarly the front cylinders will be starved for the time being, as the oil is so low in the forward part of the case that the forward cranks will not dip. This condition obtains with a crank case of the type illustrated whenever the car is inclined on a grade; which cylinders are starved and which are flooded depends on whether the car is headed up or down hill.

Still another difficulty is the tendency of the oil to swash about under the influence of its own inertia. The point is illus-

trated in Fig. 3, wherein the effect of suddenly starting the car is indicated. As the car begins to move forward the oil in the case tends to back up against the back end of the case, very much as shown. The result is that the rear cylinder is temporarily choked with oil while the other three for the time being are starved. A corresponding action occurs when the car is stopped abruptly, while in running any sudden acceleration is apt to produce a surging movement of the oil in the case.

with splash oiled engines are still on the road, however, is unquestionable, so that it is worth while to consider the remedy which has been applied in many instances by designers in seeking to avoid the difficulty. This is nothing more nor less than to construct a series of dams in the case, one between each pair of cranks. The principle involved is so plainly indicated in Fig. 4 as to require no explanation.

In some instances a two-compartment case is used, in which a solid partition separates the two sections, each of which has its own feed pipe delivering oil from an automatic pump. In other cases, three dams are used in a four-cylinder motor and five in a six-cylinder, only one or two feed pipes being used, or else the oil arriving at

them out to the exact size of the cylinder bores, to leave only a slot just wide enough to permit the connecting rod ample clearance and of sufficient length to allow it to work back and forth in following the crank. In contriving such an arrangement it will be necessary to slit the metal out to one side from each slot in order to permit it to be bent up and afterward straightened out in order to admit the connecting rod to the slot.

When such baffle plates have been installed, the amount of oil actually reaching the cylinders will be considerably reduced—dangerously so, in fact, unless special precautions are taken to see that enough oil is being splashed up by the cranks. Increasing the depth of oil in the case or enlarging

FIG. 5—NON-EFFECT OF SPLASH WITH DOUBLE BOTTOM.

FIG. 6—MODIFIED SPLASH WITH MOVABLE TROUGHS.

trated in Fig. 3, wherein the effect of suddenly starting the car is indicated. As the car begins to move forward the oil in the case tends to back up against the back end of the case, very much as shown. The result is that the rear cylinder is temporarily choked with oil while the other three for the time being are starved. A corresponding action occurs when the car is stopped abruptly, while in running any sudden acceleration is apt to produce a surging movement of the oil in the case.

These two illustrations serve to show why it is that some engines are apt to smoke when going up or down hill and when being started. In either case, it will be observed that the action can be but temporary, while it is further evident that smoke generated under such conditions must come in distinct puffs, corresponding to the exhaust of the overoiled cylinders. With a high oil level, of course, the effect will be more noticeable than with a low one.

Fortunately motors constructed in this way are now seldom made, other oiling systems having pretty generally replaced the simple splash. That many cars equipped

the bottom of the case by draining from the ends of the crank shaft bearings, to which a fresh supply is being fed at all times. In such cases, it is necessary for holes to be drilled through the dams at one or two points in order to permit the oil to level itself in the various compartments. The theory is that sufficient oil will flow through the holes to prevent unequal accumulations occurring in the various crank pits, but that the movement will be so slow that no flooding effect will be appreciable when starting or stopping, or while climbing grades of ordinary length.

It is almost superfluous to add that motorists whose cars are fitted with open cased engines readily may prevent the oil surging action by riveting suitable dams of sheet metal in the case, providing proper means for the oil to find its own level. Another method, and one that likewise may be applied to engines having other oiling systems, but which prove hard to cure of the smoking habit, is to insert baffle plates at the base of the cylinders. Perhaps the simplest way of doing this is to cut sheet iron or steel gaskets to fit the bases of the cylinder castings, but instead of cutting

the slots are alternative methods of increasing the supply to the cylinders under such circumstances. The latter is preferable, as increasing the depth of the oil in the case frequently causes a loss through the end crank shaft bearings.

The so-called "pump-over" system, which is very commonly used at the present time in new motors, may be merely a modified splash system in which the oil from the crank pits is circulated repeatedly through the bearings, or it may be an independent system, of the sort roughly indicated by Fig. 5, in which the cranks never dip in oil, but receive their supply through passages drilled in the shaft. With such a system smoking will occur if the screens which separate the main crank case from the reservoir, or "sump," in the base, become clogged so that oil accumulates in the case proper and begins to splash.

Too much oil in the system will bring about the same result, as may excessive feeding from the pump, which is to say, a faulty adjustment of the regulating mechanism, whether it consist of a by-pass or a device for altering the stroke of the pump. Rarely, it may happen that a very loose

crank shaft bearing may permit an excess of oil to escape at the end and flow out onto the adjoining crank web, from which it will be thrown off by centrifugal force, thus causing one cylinder to smoke.

Another form of modified splash is one that has been developed for the Knight engines and which has been adopted to a limited extent for poppet valve motors as well. In this system, which is illustrated in Fig. 6, the double-bottomed form of crank case is used, the upper and lower sections being separated either by a solid dam with a drainage well at one end, or by a screen, as indicated in the sketch. In either case the cranks, instead of dipping directly in the oil, wipe over small troughs, which are indicated by blackened crescents

so much heat in the cylinders that the oil literally will be burned from the wall surfaces. The smoking of a hot engine, like that of one which is receiving too rich a mixture, or the steaming of one that is having a stream of water pumped into its cylinders, however, is a wholesome indication, rather than a menace. In no case would the cause be accepted as an excuse for a smoky exhaust, in all probability, but the symptom is useful, because if observed promptly it may permit the cause to be remedied before material harm is done.

To stop a motor smoking, then:

First, study the lubricating system and make sure that it is in order and that it is adjusted as the maker intended it to be adjusted when it left his shops, particu-

least, it is well to examine them occasionally to make sure that they have not run dry. This is particularly so after a trip of any considerable duration in hilly country, as cases have been known where the heat generated in the brakes has thinned down the grease sufficiently to cause it to ooze out, leaving the bearings dry to all intents and purposes.

To Assist Starting "On the Spark."

When starting an engine "on the spark," it is almost as important to see that the spark control lever is in the retard position as it is when starting with the crank. Unless the spark is retarded the motor is likely to start backward, and it may be difficult to start the engine in the right

DESIGNS THAT ADD MEANING TO NON-SKID TREADS.

THE INDIA RUBBER WORLD'S IDEA OF DISTINCTIVE NON-SKID TREADS.

in the picture, and into which dip little scoops that project from the connecting rod bearing caps. Through the scoops and suitable oil ways in the bearings, the oil is distributed to the bearings and sometimes, also, through internal passages in the shaft to the main bearings as well. Through interconnection with the throttle the position of the troughs is altered* to correspond with the speed of the engine. Obviously the system requires constant and proper adjustment in order to fulfil its purpose. Otherwise the cylinders will be either starved or flooded.

But one likely cause of smoking remains, that is to say, that which is due to the leakage of the pistons and rings in an old and much worn engine. For this cause sometimes the adoption of a thicker grade of oil than customary can be employed satisfactorily, although the experiment of changing oil always is one fraught with more or less uncertainty. Incidentally, a change, knowingly or otherwise, to a new and poorer brand of oil occasionally may result in a certain amount of smoking in an engine that otherwise is blameless in the matter.

Rarely, too, cooling trouble may cause

larly with respect to the level in the crank case.

Second, make sure that a suitable grade of oil is being used, irrespective of what is billed, or of the brand mark on the can—substitution may be the cause of the difficulty.

Third, seek to modify the distributive system in such a way as to reduce the amount of oil that reaches the cylinder walls, but be sure that in doing so all cylinders are treated alike and that the oiling is not skimmed. Before making any alterations of a permanent nature, however, consult the manufacturer; his advice will be helpful and will tend to economy.

If the chauffeur insists that a little smoke is necessary to insure proper lubrication, it is a mark of ignorance. Smoking indicates excessive lubrication in almost every case. Adjustment of the oiling system may be checked by the smoke symptom, but it always should stop just short of the point where a cloud will hang behind the exhaust pipe.

The Lubrication of Wheel Bearings.

Though wheel bearings generally retain their packing of grease for a season at

direction afterward without a great amount of "spinning" to get fresh charges of gas into the cylinders.

One Way of Silencing Noisy Gears.

Not infrequently noisy change gear sets which are fitted with large, thin covers may be silenced to a considerable extent by placing felt or leather packing between the cover and the gear box. The reason for this is that the felt or leather tends to deaden the sounding board effect of both the cover and the gear box proper, though the cover itself generally is the greatest offender in this respect. It sometimes is possible to obtain the same effect by increasing or decreasing the amount of lubricant in the gear box.

When Throttling Causes Irregular Firing.

Inability to throttle down a motor very low and still have it fire regularly is not always caused by faulty carburetter adjustment. Very often the trouble may be traced to the ignition in that the spark plug gaps are too small. Increasing the size of the gaps almost to one-sixteenth of an inch has been known to be an effective remedy for the trouble.

EIGHT WHEELS FOR ONE MOTOR CAR

Indiana Inventor Puts Idea into Practice—
How it Differs from Present Forms
and Promotes Comfort.

On the principle that three little bumps are easier to cushion than one big one, builders of sleeping coaches have developed what is looked upon as the acme of railway comfort, and on the same general principle, M. O. Reeves, of Columbus, Ind., has constructed a multi-wheeled automobile, to which he has applied the appropriate and abbreviated designation of "Octo-auto." Instead of twelve wheels, such as

REEVES "OCTOAUTO" EIGHT-WHEELED TOURING CAR.

are used on Pullman coaches, however, the Octoauto, as its name implies, is equipped with eight, thereby introducing a very pretty mechanical principle. Reeves, himself, is president of the Peoples Savings & Trust Co., of Columbus, and first vice-president of the Reeves Pulley Co., which has been known in the industry as the producer of variable speed appliances and mill supplies. Having built one of the machines for his own use and tested it over some 2,500 miles, he now declares his willingness to license automobile manufacturers to employ his suspension and mounting system, incidentally letting it be known that the eight-wheeled car will cost about one-third more to produce than the same grade of four-wheeled machine.

The mechanical principle referred to is that of the lever of the second class and having equal arms. That is to say, a sort of "bogie" construction is employed, each end of the standard touring chassis being supported by the center of a four-wheeled truck. The result is that when one pair of wheels is raised by an obstruction in the road, the second pair remaining on the level, the center of the truck will be elevated but half the distance. Also when one pair of wheels is ascending the far side of a "chuck" hole just as the other pair is descending into it, the center of the truck will be subject to little or no vertical disturbance, the fore-carriage—to employ a

descriptive term—merely rocking from end to end. By applying this principle to both ends of the chassis, it is evident that the amplitude of the vertical motion resulting from road inequalities must be practically cut in half.

Further carrying out the idea of absorbing vibration and shock from the principal parts of the car, the regular spring suspension is retained and to it is added a supplementary spring support which serves to preserve the relation between each pair of axles and also to carry the weight of the chassis. The general appearance of the machine, which is of modified Overland construction, is shown by the accompanying picture. The rear axle is unchanged and retains the same relative position. The

frame is lengthened 19 inches at a point just in front of the rear springs, while replacing the front and rear axles on the original springs are a pair of transverse shafts on the ends of which are boxes which provide attachment for the pivotal mountings of four 38-inch leaf springs, one at each end of each cross-shaft. The four axles are clipped to the ends of these springs.

The four front wheels and the pair in the extreme rear are used for steering. The two front axles and the one in the extreme rear, therefore, are alike; that is to say, they are similar in construction to the standard form of pivoted front axle. The steering mechanism is interconnected between the axles by means of a longitudinal rocker shaft running under the chassis, from which suitable arms direct the movement of the cross tie-rods. The cross rods of the two front axles are in the rear while that of the extreme rear axle is in front. This has the effect of causing the six steering wheels to deflect to an approximately correct angle when the steering hand wheel is turned. As the single driving axle retains its original position, no alteration in the transmission is required while practically the entire car, save for the axles; frame, mud-guards and steering gear, is of standard form.

Besides the advantages derived from the method of mounting the chassis and also

from the introduction of four additional springs, further easy-riding properties are derived from the fact that the load on each of the tires is reduced to at least half that which would be required under ordinary circumstances. On this account the tire wear is reduced very largely, while it is possible to reduce the air pressure in the tires to 50 pounds per square inch. The actual expense of tire upkeep therefore is held to be particularly small, notwithstanding the doubling of the first cost of the equipment.

Chalmers Produces Long Stroke Model.

Under the slightly ambiguous designation "Thirty-six," the Chalmers Motor Co., of Detroit, Mich., has adopted a new four-cylinder model, intermediate in size and price between its two other products, and which evidently is destined to be the leader of its future line. In addition to a long-stroke motor, which has cylinder dimensions of $4\frac{1}{4} \times 5\frac{1}{4}$ inches, and a four-speed change gear, it is distinguished by a pneumatic self-starter of the type that operates with gas compressed through a check-valve on one of the cylinders and distributed through a special timing valve. It is listed to sell for \$1,800 with the following liberal equipment: dual ignition, demountable rims, a full set of oil and gas lamps with Prest-O-Lite tank, horn, pump and tools. The front doors of the enclosed bodies will be ventilated. Top and windshields list as extras. Both the "30" and "40" models, priced at \$1,500 and \$2,750, respectively, will be continued, but with a complete equipment which will include tops and windshields.

Abbott Adds New Model; Reduces Old.

Besides announcing a new seven-passenger touring model to sell at \$1,800, the Abbott Motor Co., of Detroit, Mich., has declared a reduction in the price of its current model 30 from \$1,500 to \$1,350, including all equipment except top and windshield. As at present, electric lights and a 100 ampere-hour storage battery are a part of the standard outfit. The new model 44, which will sell for \$1,800, has a $4\frac{1}{2} \times 5\frac{1}{2}$ four-cylinder motor, dual ignition, three-speed change gear, independent clutch and brake control and 120-inch wheel base. Both models will be made in a variety of body styles with closed-fronts and also in limousine and coupe forms as in previous years.

Chicago Dealers to Hold "Open House."

The Chicago Automobile Dealers' Association has voted to hold what is termed a "Fall show," but which really will be made in the nature of "open house." The idea is for the various dealers to decorate their stores and otherwise make one week in October a gala one, during which the 1912 models may be exploited under favorable auspices.

GARAGEMAN AND THE CHAUFFEUR

He Details Peculiarity of his Position Between Owner and Driver—Also Some Grafting Chauffeurs' Tricks.

"Have you noticed what a vast difference there is in chauffeurs?" asked the manager of an uptown garage. "If you haven't, spend a few days with me, and I will show you some traits of human nature which you would not believe existed. As a class chauffeurs are a poor lot, and many who obtain drivers' licenses should not be permitted to sit in a gentleman's car, much less drive it. I do not mean to say there are not some excellent men driving automobiles. They, however, are in a class by themselves. The distinction I have in mind is between the chauffeur who looks after the interest of his employer and the one who appears to feel that the owner of the automobile is under obligations to him for accepting the position. These men, as a rule, can drive, and so long as they 'get away' with everything else they are satisfied.

"The sooner the automobile world is rid of them the better will it be for every one concerned. They ruin good customers by contracting unnecessary bills, in order to make a commission. They are looking for discounts or tips all the time and demand a commission on everything the employer has to purchase for the up-keep of the car, regardless of the fact that they are paid to take care of the car, at so much a week, or month, the same as every other man who works for a living. Some of the tricks they employ in order to get an extra dollar or two would surprise you. Why, I have known some of them to intentionally put the car out of commission in order to charge up repair bills.

"Speaking in this strain will not make me popular with many automobile drivers, but there are some things owners should know, and I wish some of them knew their chauffeurs as I know them. In this garage, for instance, there are drivers who would not accept a commission, even if it were offered. These men want the best of everything and are always 'on the job' for the interest of the employer. The result is, the owner is never disappointed with his automobile when he wants to use it. Several cars here have gone more than 50,000 miles, according to the odometer, yet the owners never have been required to pay large repair bills. The drivers understand mechanics and can make the necessary repairs to keep the car in first class condition. These men, as a rule, are appreciated, for most owners know when they are receiving good service. The other class of driver generally expects the garage owner to do everything and send the owner a bill in order that he may get a few extra dollars each month. It is

catering to the latter class that has caused a number of garages to close up. Such things are bound to come out in the end, but the owners do not always tell why they quit his establishment.

"It has been generally supposed that the law making joy-riders guilty of grand larceny for taking an automobile from the garage without permission of the owner has broken up the habit. But take it from me, it is a false impression. They are still at it. And, of course, such night outings cost money, apart from the wear and tear on motors and the expense for gasoline and oil consumed. Does the chauffeur pay for any of the supplies? Not much. He charges them to the owner, who, although he does not realize it, provides the money needed for entertaining at road houses which cater to chauffeurs and their 'joy-riding' friends. One such place within the city limits has its dance hall decorated with old automobile license numbers, obtained from chauffeurs, as proof of its popularity. The average driver seldom receives more than \$25 a week. This sum is not sufficient frequently for one trip, therefore he must get money in another way. He never hesitates a moment, whether it is selling extra tires and tubes to some second hand dealer and ordering new ones for his employer or disposing of other necessary accessories.

"I have known chauffeurs to sell the gasoline out of the supply tank on the car and return to the garage to have the tank filled, so that it can be charged to the employer. I know one man—he does not store here—who has an arrangement with his employer by which he pays cash for gasoline. In order to secure this arrangement he guaranteed to get the fluid at 18 cents a gallon. The standard price for good gasoline is 20 cents, and to keep up his end of the agreement this chauffeur resorts to all kinds of tricks. For a long time he succeeded in obtaining what he wanted from garage employees, but when the management got wise, the employee was discharged. However, it is an easy matter for this fellow to get gasoline from another chauffeur by syphoning it from one tank to another, even on the street. Frequently he has a friend get five or ten gallons charged up, but the gasoline does not go into the friend's car.

"Some people imagine that the garage manager or owner can stop this sort of thing. But it seems easier than is the case. The manager or owner is powerless, because no matter how observant he is or what policy he adopts to end such abuses, it comes back on him. In the first place, few automobile owners will take a chauffeur recommended by a garage. They generally get them through the automobile company from whom the car is bought, and the company will recommend only a man who understands their car and who is considered a careful driver. It knows nothing whatsoever about the man's habits or his honesty. The garage owner is the one who

knows, however, and frequently it is a surprise to him—how some of the chauffeurs hold their jobs. They do practically nothing except drive under the owner's orders, and if the slightest thing goes wrong it is blamed on the garage. I have known joy-riders who have met with accidents on the road, such as breaking a lamp or axle, and the next day tell their employer that the accident occurred in the garage and that the garage will make good. Then they go to the garageman and want him to pay the bill and charge it to the owner's account as so much gasoline supplied. Most owners never look into the cost of gasoline, and many sins are committed in its name.

"By these little things you can see a garageman's life is not a bed of roses. He stands between both owner and driver and is therefore the one blamed by both sides. If he refuses to assist the chauffeur it is an easy matter for the latter to set his employer against the garage and cause the car to be taken to another place. The chauffeur receives orders direct from his employer, so the garageman only knows what the chauffeur says, and therefore has no direct control. An owner may order the car for two o'clock in the afternoon, and the chauffeur may take it from the garage at noon, and by the time it reaches the owner's house it may be more or less dirty, and the garage is blamed for carelessness. When the first of the following month comes the car is taken away, and the garageman has no redress whatsoever. This is the sort of whiplash some of these chauffeurs hold. They know it and impose on both the garageman and their employer. Of course, I have spoken chiefly of the grafting chauffeur, of which there are so many. But there are many chauffeurs who would not stoop to such tricks. This class is particular, and if, through some oversight a thing or two about the automobile is not just as it should be, they themselves will perform the finishing touches and make no complaint. These men are the kind we like to have around us.

"Some owners are so uncertain as to the time they will use their cars that they compel their drivers to hang around the garage all day awaiting their call. For this class a recreation room must be provided at the garage. How do these men put in the day? Reading soon grows tiresome, and of course they turn to games of chance—craps, poker or some other gambling device. In quite a few garages, where a number of chauffeurs congregate, I understand high play is frequently indulged in, for which the automobile owner is made to pay, without knowing it. Here we have only a few of the gambling kind, but in one place with which I was connected quite a game was run by an outside man. I was not the manager, and therefore could not stop it. But if the police department would conduct investigations along this line, 'clubs' would not be the only places raided."

NEW TRUCK FROM CONNECTICUT

It is of Standard Design but Embodies Some Special Features—Strong Claims Made for Demountability.

Embodying a number of useful features which are calculated to prevent undue sacrifice of working time in the making of adjustments and repairs to vital parts, the Murray truck, which is made in three and five ton sizes, has just been launched in Norwalk, Conn., where it is produced by C. L. Barker, otherwise a builder of gas engines, valves and fittings. The general design of the vehicle is that which has been adopted by a

wheel housing and running in an oil bath. So smooth is the engaging action that it is claimed the truck can be started on high gear under load without jolt or jar. The change gear mechanism, which is of the selective sliding pinion type, is unusual to a degree that both driving and lay shafts are mounted in a single casing, while by the employment of double driving bevels on the counter shaft, direct connection is obtained on both second and third speeds. As both low and reserve speeds are obtained by the action of a single pinion on the lay shaft, it follows that the mechanism is exceedingly simple.

Another rather unusual feature is the use of ball bearing mountings for all four wheels, the front wheel supports being of

NO TIRE FAMINE IS IN SIGHT

Merely a Not Unusual Shortage of Popular Sizes—And the Visible Supply of Rubber is Enormous.

Apart from the usual summer stress in the tire market it has been reported that the present season is witnessing a record-breaking shortage in the popular sizes. Not only are various agencies and branches shy of the stocks that are most in demand, but factories are represented as running anywhere from full time to three shifts a day in an effort to supply the deficiency. The situation is variously ascribed to the weather, highway conditions, the increased use of motor cars, the growing use of demountable rims, commercial vehicle developments and the consequent increase in demand for solid tires; to the confusion resulting from the increased requirement for odd sizes and to a lack of foresight on the part of manufacturers in making their plans for the present manufacturing season last fall.

It is not claimed that the shortage is due to market stimulation resulting from prices lowered in sympathy with the present cost of crude rubber. Tire prices are lower than last year—as much as 25 per cent. lower in some instances—but rubber, despite the buoyant tendency of the moment, is 55 per cent. cheaper than it was one year ago. The actual fact of a dry spring and early summer, which brought on an early touring season, and also dried up roads and laid bare gravel surfaces in many instances, affords the most probable explanation for the scarcity when taken in conjunction with the natural growth of the business. While there is a scarcity, which in some cases is said to be serious, there are no indications that anything like a tire famine is threatened.

In respect to the crude rubber market, which has afforded a remarkable example of elasticity during the past three years, the situation once more is becoming interesting. After a fairly uniform decline since the first of last March, when up-river fine Para was quoted in New York at \$1.68 a pound, a 16-point rise, occurred during consecutive five days, bringing the price up from .98 on Friday of last week to 1.14 on Tuesday. The jump is ascribed to circumstantial reports of the long talked of valorization plan on the part of Brazilian interests, which it is said has now gained the sanction of the government of Para and is about to go into effect. Whether the reports are correct or whether, as has been intimated by those who claim they lack authentication, they are inspired by investors in Ceylon grades, which rapidly are assuming competitive importance, is difficult to determine.

For many months rubber gatherers and

THE MURRAY TRUCK—A RECENT CONNECTICUT PRODUCT.

number of successful producers of heavy commercial vehicles. The engine is carried under a hood in front of the driver's seat, the gearset is mounted in the waist of the chassis, and final drive is accomplished by means of double side chains, the specifications providing that the latter shall be encased and run therefore under conditions suitable to long life and efficient action.

Special claim is made for the demountability of the various parts. The complete driving mechanism, including the clutch, can be dismantled and replaced in no more than ten minutes. The radiator and steering gear likewise are so arranged that they can be removed in an exceedingly short time.

The motor employed is of the four-cylinder, four-cycle, vertical pattern, and develops 50-55 horsepower at 1,000 revolutions per minute. The master clutch is of the multiple disk type, encased in the fly

the familiar cup and cone type, so designed for the purpose of sustaining the heavy end thrusts to which the wheels are subjected. Special provision also is made in the steering gear to prevent the effects of wear from interfering with the control of the machine, what is described as a braking arrangement serving to effect the desired purpose. As the picture shows, the driver's position is on the right hand side of the vehicle, the control levers being arranged in the usual manner.

To Make Berlin a Horseless City.

In order to reduce the number of horse-cabs in Berlin, the chief of police of that city has offered to supply proprietors with one taxicab license for every 10 horse-drawn vehicles which they withdraw from service. According to a foreign publication, no more licenses for horse-drawn cabs are to be issued.

brokers in the Amazon territory have been reported as plotting for control of the market. Falling prices are claimed to have reduced the producers to desperate straights. In consequence they have formulated an ambitious plan involving a heavy government subsidy based on a \$30,000,000 loan and the exaction of a surtax of 5.8 cents a pound, the establishment of banks for the purposes of advancing funds on lands and crops, and finally the regulation of prices by means of the great power thus amassed.

Anticipating the fruition of such a plan, it is said that certain interests have been holding back considerable supplies, and have been caught by the falling market. Despite repeated assertions that the government of Para has endorsed the scheme, this is still denied in some quarters. Those who are anxious to prevent alarm also are pointing to the fact that the world's visible supply "as of June 30" is enormous. Including fine, medium, coarse and caycho grades, as well as some 2,881 tons of Liverpool syndicate stocks the total estimate is 10,950 tons. The corresponding estimate for 1910 was only about 3,457 tons, as compared with 2,319 tons in 1909 and 4,682 tons in 1908.

Effect of Large Wheels on Tires.

As regards the advisability of fitting larger tires to a car it should be remembered that there are several factors bearing directly on tire depreciation. One of them is the abrasion of the rubber on the road surface, another is the rotting of the fabric due to the ingress of water through cuts, and another, and probably the most important, is the effect of fatigue of the fabric caused by excessive or frequent bending of the walls to a curvature which strains the fabric. While increasing the size of wheels, in order to allow of larger tires being fitted, undoubtedly increases their weight, and this apparently tends to increase fatigue, the increased size operates to allow of a larger vertical movement of the tire without curving the walls to an extent which is objectionable and so relieves the stress. The larger tire area in contact with the ground also decreases the pressure per square inch at that particular point.

To Make Nuts More Accessible.

In overhauling a car there always is likely to be a certain number of bolts the nuts of which can be made much more accessible by simply placing the head of the bolt where the nut was before. Of course care must be taken not to invert any bolts that have a better reason than appearance for being the other side up, and it is to be remembered that a bolt dropping out may be infinitely worse than a nut dropping off. But with cotter pinned nuts there is little occasion for working a wrench in frame channels and other places, when the nut might as well be outside.

BRAKES FOR MOUNTAIN REGIONS

Their Cooling Ratio Chief Consideration, Declares an Engineer—How a Swiss Maker Meets the Requirements.

Commenting on the inadequacy of the brakes as ordinarily applied to English cars, none of which, he states, are so designed as to permit of a steady continuous descent of one mile on a grade of 10 per cent., at a speed exceeding fifteen miles an hour, a British engineer has advanced the opinion that the size of the brakes should be determined by the rate at which they can cool and not by considerations of mechanical strength and the desire to secure sufficient wearing surface and smooth action.

"Brakes are intended to dissipate energy in the form of heat," he explains. "In the case of breaks applied during a long descent potential energy has to be thrown away; in the case of a traffic stop kinetic energy is in process of being wasted, and in both cases the brakes get hot. In the latter, the intervals between the applications of the brake are so large that no overheating is to be feared; a car which may have to descend a pass on tour, however, is to be considered very differently.

"This may serve as a warning," he adds, "to those who start touring with cars in first class order, with brakes, as they think, tested, and found by a few applications at starting to be in good condition, that they must even at the present day continue to follow the advice so often given by the early motorists, and nowadays rarely attended to, of starting on such a hill with the gear lever in a low speed notch and the clutch in, the spark being cut off and a full air admission given to the air inlet pipe."

Continuing, he says: "This conclusion may be somewhat unexpected, since the natural man expects his car to be equipped with brakes fit for an emergency, but it is a question of economics. From the maker's point of view, which is the one we must adopt if we are to profit by the cheapness arising from buying a standard article manufactured 'repetitively,' there are some hundreds of thousands of car miles run on average roads to every one continuous mile on such a gradient as has been referred to. Therefore the maker rightly judges it worth while to adopt a type of brake which is nearly always adequate in lieu of the inordinate size of brakes required in the exceptional case.

"He would, in fact," continues the engineer, "require to give to the air cooled brakes a surface not 100 or 200 per cent., but some 10 or 12 times greater than he does, and the ordinary buyer simply will not pay for this protection in the hypothetical case of his wishing to scale the Alps. There remains the alternative of water cooling the brakes. This plan is quite suc-

cessful when in use, but it has the drawback that it depends on the driver's memory. Originally it was so contrived that water was turned upon the brake bands whenever the brake was applied by the mere depressing of the pedal, but this was found to deplete any reasonable tank too quickly for any long tour if the flow was sufficiently great for such a road as is here premised. Thus it is, that to expend the energy in friction, etc., in driving round the engine by the car's weight, is nevertheless a simple and practical solution of the difficulty."

The retarding effect of an engine which nominally yields 40 horsepower on the brake is due to the fact that it will absorb about 15 horsepower, and sometimes more, if driven at full speed with the throttle fully open (so as to get full compression), but with the spark cut off. This power is partly used up as friction in the bearings and in moving the pistons up and down and partly in compressing the air, which when re-expanded does not return all the energy of compression to the crank shaft.

Citing the case of a Swiss manufacturer for whose cars mountain descents are a normal and not an exceptional event, the same authority describes a novel modification of such an "engine brake."

"An improvement was made in the retardation obtained," he says, "by opening the exhaust valves as soon as the compression was complete, and, therefore wasting all the heat of compression. The only further improvement was that by which the inlet valves also were opened twice as often as normally, so as to get two compressions per cycle instead of one. All this was and is accomplished by the driver slipping the cam shaft slightly forward, so that a new set of cams actuate the valves.

"It is for the buyer to know that such things as this, and water cooled brakes, exist and are on the market," he says in conclusion, "and then he must decide whether the amount of mountaineering he contemplates warrants a preference for cars so equipped."

How to Preserve Chamois Skins.

After chamois skins used for cleaning and polishing have been in service for some time they become dirty and grit which will mar paint work will adhere to them. They may be returned almost to their original condition, however, though the operation necessarily is lengthy. They first should be brushed with a stiff brush to remove all adhering grit, after which they should be covered with soft soap and allowed to remain several hours in a bath of hot water to which a little common washing soda has been added. Next, they should be rubbed until perfectly soft and clean, when they should be rinsed in a weak solution of soda and soft soap in hot water and hung up to dry. Chamois skins should not be rinsed in pure water as it has a tendency to harden them.

Springs; Their Variety and the Reasons Therefor

The luxurious springing of a particular automobile long may have been the source of unmitigated joy to the owner. Eulogizing on the merits of the car, his enthusiastic phraseology probably embraced such gems of rhetoric as "smooth as silk," "rides like a hammock" and other equally superlative utterances. And effects which justify such expressions are by no means uncommon.

Generally speaking, and contrasting present productions with those of even a few years ago, when the arts of spring making and suspension were thought to have

posed, as in many cases they tend to increase vibration. Therefore in seeking the bodily comfort possible only by the use of properly designed and proportioned springs, the owner also insures a reduction of maintenance cost and increased longevity of his property.

Though automobiles are not intended for continuous high speed, unless they are built expressly for racing purposes, they still may be forced to "make time" and they therefore involve spring conditions which are found in neither horse-drawn carriages nor railroad cars, the former of which must

of cars. As their name implies, leaf springs are composed of a number of steel leaves of different lengths, arranged according to their lengths one on the other. Though it may not be generally known, the leaves decrease in a regular scale of lengths. Good engineering practice allows that "the ends of the several leaves shall touch the sides of a triangle whose base is drawn between the extremities of the longest leaf and whose apex is at or about the theoretical center point of the spring's movement." Which is to say that with a well-proportioned spring in its normal position, the

FIG. 1—POPE-HARTFORD SEMI-ELLIPTIC SPRINGS.

FIG. 2—THREE-QUARTER PLATFORM SPRING SUSPENSION.

reached perfection, though it often required that a person be a genuine martyr to sit through a ride of other than very short duration, all cars in some degree now ride more comfortably; in fact, the difference in the riding qualities of ancient and modern cars is more marked than is the difference between existing models of present day manufacturers. Which is to say that whereas all the early cars, with few exceptions, were "nerve wreckers," all modern cars ride easily; they differ, it is true, but none may be said to ride really hard.

Probably the first answer to the question "Why do cars ride easily?" appears to be, "For the comfort of the passengers," which is true to a certain extent. Unless cars rode easily they would be in comparatively small demand, at least for pleasure purposes. But there is another reason which is of equal if not of greater importance, namely, the effect of properly proportioned springs on the mechanism of the car itself. It readily may be appreciated that without springs the vibration of the engine and the racking the car would be subject to in passing over ordinary roads, speedily would make it a candidate for the junk heap. Poorly designed springs, on the other hand, serve little better pur-

provide for maximum road roughness and minimum speed and the latter for maximum speed and minimum road roughness. Automobile springs, on the other hand, must provide for both these conditions and at the same time be so designed as to permit of maximum speed and maximum road roughness.

Principally, the owner concerns himself merely with the fact that his springs do provide for such conditions; undoubtedly a large percentage of motorists would be nonplussed if asked how springs are composed, the names of the parts and of the types of springs, or almost any number of other questions, which, while simple, seldom are thought of. Briefly, springs are of two general types, coil and leaf. Though the use of coil springs generally is confined to light vehicles, one of the most noticeable examples of their use being found on Brush cars, at least one manufacturer, the Lansden Co., Newark, N. J., has used them to advantage on heavy vehicles, the Lansden two-ton truck, which is an electric, being so mounted.

Generally, however, automobiles both for pleasure and commercial purposes are carried on leaf springs, though coil springs often are used as auxiliaries on both types

end of each separate leaf would be equidistant from that of the one immediately above it and of the one immediately below it.

As constructed, the leaves generally form superposed arcs of a number of concentric circles, the curvature, or camber, of the leaves representing the difference between the spring under static and maximum load. Under maximum load, the leaves would be nearly straightened out under stress; beyond that point, as they are bent downward, the point of ultimate strength, involving loss of elasticity and breakage, rapidly is approached. It is absolutely essential that the camber of each of the leaves be the same before the spring is assembled, so that all the leaves shall have the same strength. Although the strength of the spring to resist bending, as a whole, would be practically the same if there was a slight difference in camber in the leaves, the strength of each individual leaf would not be the same and they would be likely to fracture on occasion.

To prevent the leaves from moving longitudinally, some springs are bolted through or "nibbed" at the center; others are maintained in position longitudinally by means of small protruberances made in-

tegral with the leaves and fitting into indentations in the leaves above or below them, while others are fitted with small pins which register in slots cut through the leaves. This latter method seldom is used, however, owing to the fact that it weakens the leaves to a certain extent. Lateral movement of the leaves is prevented by "kitten-ears" or small tabs on the sides of the leaves which are bent down to embrace the next lower leaf.

Springs always are rigidly attached at their centers, for which purpose spring clips are used. Owing to the fact that springs are elongated to a certain extent when flattened under load, however, they cannot be rigidly fastened at the ends where they are attached to the chassis frame. That is to say, they cannot be rigidly attached at

which, in addition to producing a condition which is annoying, contributes little to the protection of the mechanism. A prominent authority on the subject has stated that as a general rule, the best spring is one "that moves quickly when idle or worked on, and slowly when working." Which is to say, a spring should absorb jars by friction between its leaves rather than by transforming them into a series of oscillations.

In the designing of springs there are three important features which must be reckoned with, namely, the static load, the maximum load and the ultimate load, which latter is the greatest possible load which can be carried with good spring action; it represents practically the limit of endurance of the spring. The static load

name implies, half an ellipse, and is arranged to be attached to the axle at its center and to the chassis frame at its extremities. In general practice, semi-elliptic springs are used for the front support, though in the Pope-Hartford construction, illustrated in Fig. 1, and also in the Alco, Cartercar, Columbia and Apperson and in a number of others, semi-elliptic springs are used both front and rear with excellent results.

Full elliptic springs consist of two semi-elliptic springs attached at their extremities so as to form an ellipse. This arrangement is shown on the Marmon chassis, illustrated in Fig. 3, and it also is used on such other well known cars as Buicks and Franklins, the attachment of the springs on the latter being unique in that the axle is

FIG. 3—MARMON FULL ELLIPTIC SPRINGS.

FIG. 4—FLANDERS SCROLL FULL ELLIPTIC SPRINGS.

both ends; when the rear springs are made to perform the functions of radius or torsion rods, they must be rigidly attached at the front ends, though the rear ends always are flexibly connected by means of shackles, which permit of a certain amount of movement. When some separate means, other than the springs, is used as a radius member or members, the rear springs then require to be shackled at both ends, as the position of the rear axle relative to the chassis frame is altered slightly when the springs are compressed. Front springs cannot be shackled at both ends; they must be securely anchored at one end, usually the front, because one of their offices is to maintain the front axle in position.

To be thoroughly serviceable, theoretically, springs should possess two essential qualities in due proportion, namely, resistance and resilience, but that few are absolutely perfect in this respect is evidenced by the addition of such devices as shock absorbers and auxiliary springs. It is the object of designers to obtain springs which shall give sufficiently to absorb the jar of travel but which shall not be so resilient as to rebound in a series of oscillations,

comprises the dead weight which is carried above the springs when at rest, and the maximum load is the proportionately increased weight of the static load when the vehicle is running at its greatest speed over the roughest negotiable road.

Considering the functions of the springs, it is obvious that they must be calculated to retain their elasticity, or have an ultimate strength far beyond the maximum load, and in this respect it is worthy of remark that in railroad practice it is customary to calculate the springs for an ultimate strength of twice the maximum load. One of the difficulties of the designer is in obtaining perfection of spring action when the weight of the vehicle is in excess of the weight of passengers carried. There are no accurate data in reference to this problem, and the adoption of the proper springs usually is the result of actual tests.

There are five arrangements of leaf springs as used on the better known cars, as follows: Half-elliptic, elliptic, scroll elliptic, three-quarter elliptic, three-quarter scroll elliptic and three-quarter platform, otherwise known as three point support. The half- or semi-elliptic spring is, as its

attached to the upper side of the lower member of the spring and thus comes between the two members, the center of gravity of the car thereby being kept as low as is possible with the use of full elliptic springs. The Flanders scroll elliptic, illustrated in Fig. 4, is practically the same as the elliptic arrangement, except that the ends of the longest leaves of the upper member are formed into "scrolls" and attached to the lower member by means of shackles.

The so-called three-quarter platform arrangement shown in Fig. 5 is used comparatively little, though it may be found on American, Chadwick, Croxton-Keeton and Firestone-Columbus cars.

Each of these arrangements has its advantages, or disadvantages, according to whether it is used or not, though owing to present-day methods of manufacture and mounting, there really is little difference in the ultimate results obtained by the use of either.

The three-quarter elliptic arrangement, either plain, or scroll as shown on the Stearns chassis illustrated in Fig. 5, is used almost as extensively as all the others

together; as a matter of fact, the increase in the number of cars exhibited at the 1911 New York show on which it was seen, over those at the 1910 show, was in the neighborhood of 40 per cent., which augurs well for the popularity of the system. It is claimed by advocates of the system that side sway is greatly reduced by its use, though in this respect it is only fair to say that the reduction of side sway is most fully realized with the use of semi-elliptic springs. But while the absence of side sway is to be desired, resilience also is wanted, and advocates of three-quarter elliptic springs promptly "slap back" at the semi-elliptic contingent by saying that semi-elliptic springs are deficient in this

this increases the general efficiency of the springs.

The careful observer doubtless has noticed that there is one decidedly different point of spring hanging on the majority of automobiles and horse-drawn carriages, namely, that on many carriages a single semi-elliptic spring placed transversely is used in both front and rear, and that except in very few cases, automobile springs are placed longitudinally. The reason the springs are placed longitudinally is to absorb to a certain extent the forward lunge of the body of the car, which always is present when the vehicle is in motion. Though the system of placing the springs transversely is not applicable to heavy cars,

they give no hint of the fact which is evidenced by the continual squeak emanating from almost nine cars out of ten, grease cups or oil holes on spring shackles are placed there to be used and are not for ornament alone, though it might be said in justification of the owners that some grease cups are, owing to their woefully small size, good for little else but ornament. Another of the peculiar points of construction is that the grease passages themselves often are so small that hard grease cannot be used, and if soft grease is used it runs out without attaining its end. With the laudable object of obviating recurring troubles, it would be wise for the owners of cars equipped with such "ornaments" and miniature grease passages to replace the former with real grease cups and to drill out the passages slightly larger. Undoubtedly such drilling will weaken the pins to a certain extent, but usually the holes are so very tiny that they may be drilled out to practically twice their size without seriously endangering a fracture.

As regards the placing of lubricant between the leaves of the springs—this should be approached with caution. Cases of squeaks being caused by the leaves are so rare as to be negligible. Generally the whole trouble will be found to be in the shackles. While the placing of lubricant between the leaves probably will cause the car to ride more easily, it should be remembered that friction between the leaves actually is desired and is essential to the proper action of the springs. As has been pointed out heretofore, the springs are designed to absorb the jars of travel by friction between the leaves rather than by transforming them into oscillations.

FIG. 5—STEARNS SCROLL THREE-QUARTER ELLIPTIC SPRINGS.

respect. Whether or not this is the case is open to question, though complaints seldom are heard.

Three-quarter elliptic springs are peculiarly adaptable to many of the present forms of dropped frames. Another consideration in their favor is that they are attached to the frame, and therefore support the load at two points, instead of at one, as is the case with full elliptic springs, and for this reason, also, the springs are more easily maintained in alignment. This same argument also holds good for semi-elliptic springs. Probably one of the greatest reasons for its widespread adoption is that by its use the necessity for separate radius rods, and in some cases, separate torsion rods, is obviated, the springs being so arranged as to perform the functions of one or both of these parts. Seven-eighths elliptic springs are simply a modification of the three-quarter arrangement, and differ from them in that the top quarter is carried along the chassis frame and attached at two points wide apart. In action there is thus a flexure of the top "seven-eighths" between the two clips by which it is attached, and it is claimed that

the manufacturers of such well known light cars as the Ford and Hupmobile have been quite successful, and for light cars of this general class it appears to be par excellence.

As regards the changing of springs by owners who may suspect that their cars are not quite "right," the practice cannot be too strongly deprecated. Good spring action cannot be obtained except with properly proportioned springs, and if they seem to be improperly proportioned and the car rides too easily (so as to allow the chassis to touch the bumpers on the axle) or too hard, to the designers alone should be assigned the task of righting the wrong. In the first place, they have a right to know so that they may not make the same mistake again, allowing that a mistake has been made, and in the second place, the experience of the manufacturers is infinitely greater than that of the individual owner, and it is not improbable that some other trouble or remedy may be suggested.

Last, but not least, the springs and their shackles, or other flexible connections, should be lubricated. Though comparatively few owners realize it, or if they do

About Setting a High Tension Magneto.

While the setting of a high tension magneto usually is a job which is attended to by a man thoroughly versed in such things, and therefore has come to be regarded as being more or less out of the province of the average individual, it is not as difficult an operation as it appears and may be accomplished quite easily if a little care is taken. The first consideration is to see that the piston in the first cylinder of the motor is in the firing position. That is to say, the piston is at the top and both inlet and exhaust valves are closed. Then with a wire through the petcock as a gauge, the flywheel should be turned backward until the piston has receded exactly one-eighth of its stroke, which is the position at which the magneto should "break" for full advance. A cylinder with a bore of five inches therefore would require that the piston be "backed down" five-eighths of an inch. It is unnecessary to "time" more than the first cylinder, although it will do no harm to verify them all in rotation. Having once set or "timed" the magneto there is small danger of its becoming disarranged.

MOTOR TRUCKS IN LAND OF BANANA

American Vehicle, Introduced as Experiment, Proves Successful Where Others Failed—Other Orders Follow.

"I have interviewed each of the managers of the four fruit companies here with regard to the use of motor trucks in the banana business and especially with respect to the experiment in progress with a car of British manufacture, [which was sent 'on approval' with a driver and a supply of repair parts,]" says the American Consul at Port Antonio, Jamaica, in an official report. "None of the four knew that there

manufacturer seemed equally confident of a satisfactory result of the trial."

In a later report from the consul, Dreher, he says: "Through letters from the American consular agent at Port Maria and from a prominent exporting firm at that place, I am informed that the American car to which reference was made in a previous dispatch has done its work very successfully in the parish of St. Mary, and that the agent of the company will soon return to the United States to bring down two more motor trucks to be used for hauling bananas."

"In the meantime steps are being taken to form a mutual liability company to operate a number of power trucks in that parish. A few planters have agreed to be-

KISSEL TRUCK IN JAMAICAN BANANA PLANTATION SERVICE.

was about to be made an experiment with an American motor truck; but on yesterday a member of one of these companies, who resides in the adjoining parish of St. Mary, returned from a visit to the United States, bringing with him to be tested a car [a Kissel] manufactured at Hartford, Wis., of 50 horsepower, with a capacity of three tons. An agent of the manufacturers and a chauffeur came with the machine to make the test of its suitability for use on a banana plantation. They also brought down a 60 horsepower passenger automobile. It is a pleasure to make this statement with regard to the enterprise of an American manufacturer in his effort to introduce his machines into Jamaica under favorable auspices.

"It may be well to add that the member of the fruit company who brought the truck to his plantation expressed to me his belief that the car would prove a success in his business, and the agent of the American

come stockholders in such an organization, while others are reported to be as yet undecided. An officer of the United Fruit Co. at Port Antonio has informed me that, as that company had already lost money in a motor car enterprise, it would be unwilling to take stock in another company of that sort until further experiments had fully demonstrated the adaptability of automobile trucks for hauling bananas under conditions that have prevailed.

"It is to be remarked that as this is the dry season in Jamaica the cars now being used have no opportunity to be tested on wet roads and on narrow roads in rainy weather, when in turning aside to pass another vehicle the wheels of heavy motors are apt to become mired in mud. However, as the American car has done so well, it may be advisable for manufacturers of motor trucks to send catalogs to this consulate and to the consular agency at Port Maria."

OPENING IN DOMINICAN REPUBLIC

**Not a Large One but Still an Opening—
New Road and a Coachman Stimulate
Automobile Demand.**

"There are several conditions unfavorable to a wide extension of the sale of automobiles in the Dominican Republic, the principal one being that comparatively few people are financially able to purchase them," says the American Vice-Consul at Santo Domingo. "A second reason is that the country lacks roads suitable for motoring. However, there is now being constructed from Santo Domingo, a well paved city of some 20,000 inhabitants, a splendid macadam road leading to the city of San Cristobal, a distance of some 20 miles. Ten miles of this road are open to traffic and offer motoring facilities. This is the only driveway in the neighborhood and is the cause of the present number of automobiles in use here. During the past eight months there have been imported some 15 machines from the United States and Porto Rico, the majority of them since the beginning of the year.

"In September, 1910, there were only two machines in this city, but later an enterprising coachman brought one from Porto Rico for hiring purposes. His venture in this direction must have been partly successful, for this car was soon followed by another of the same make and one of another make, and in the past three months about 10 cars have been purchased and are being used daily for hiring purposes in the city. Three cars arrived on the last steamer. The machines formerly rented for \$5 per hour; the price now is \$3. The import duty on automobiles is 20 per cent. ad valorem. Gasolene sells for 50 cents per gallon."

American Car Makes Good in India.

"An American motor car has made an excellent reputation in India during the last year, and as a result 30 of this make have been sold to the Eastern Bengal Government for use at the Coronation Durbar in December, and the prospect is good for the sale of many more," reports the American Consul-General at Calcutta. "This American company put its prices right, furnished good cars, and was painstaking and generous in looking after repairs, etc., after the cars were sold and started. They will be a good advertisement for the American motor car."

To Avoid "Racing" in Starting Engines.

If the ignition current first is cut off and the throttle then is opened, the unnecessary racing of an engine to ensure easy starting will be obviated and the useful life of the motor considerably increased.

ROUGH GOING IN THE PHILIPPINES

Hupmobile Globe Girdlers Accomplish a Notable Journey—Rafts and Caribou Wallows Instead of Bridges.

Accomplishing a feat never before performed in the history of the Philippines, the Hupmobile "export expedition" blazed the way from Manila to Baguio, the summer capital and hill resort. Highways leading out of Manila are fairly good and the roads within 40 miles of Baguio are a credit to the American engineers who have built them, but the intervening 150 miles made the going laborious every mile of the way.

Along the route bridge after bridge built in the Spanish days had crumbled, and the disused roads were overgrown with grass. These fallen bridges forced runs across untracked country—through rice fields, across innumerable fords and in some cases floating across on rafts.

The Hupmobile party, which since has left the Philippines and is much further on its way around the world, included Tom Jones and Thomas Hanlon, of Detroit, and a native guide. For about four hours the going was good, then came mud holes and trackless stretches which would have been absolutely impassable in the wet season. It was not uncommon to have mud and water come above the running board.

"Early in the afternoon," writes Jones, "we reached the Penaranda River, where the only means of crossing was a railroad bridge. The ties were fully eighteen inches apart and we had to get the native to go ahead and lay planks, the car proceeding about 10 feet at a time. After the bridge had been crossed with an hour and a half of hard work, we ran into a series of trestles that could not be planked, as there was a sheer drop of 40 feet on either side. There was no way to get off the road bed, so there was nothing to do but lift the car and turn it around and recross in the same tedious manner.

"We camped that night with Mr. Miller, an American school teacher, and the next day at San Isidio crossed the river on a raft of bamboo poles. This was so light that the natives had to swim along the edges to prevent the car from sinking.

"At noon we reached Cabanatuan, where there was another deep river to cross. This river was spanned by a bridge of bamboo and grass. The American engineer, W. E. Weaver, in charge of road work there, doubted whether the bridge would hold the car, but we managed to get over in safety.

"The only stretch of good going encountered in the whole afternoon was about three miles of partially built road. On this stage of the trip bridges were unknown and we bumped across open fields and through caraboo wallows until Pangasinan province was reached.

"Here the government road began. A block system similar to that on the railways is used. Vehicles are held at one of the camps until all approaching in the opposite direction have passed. There is a stage line of eight-cylinder automobiles operated by the government between the end of the railroad and Baguio.

"Just before Baguio is reached there is a hill known as the Zig Zag. Around this hill is a splendid road, a monument to the skill of the American army engineers. Twenty-two miles of this climb is over the Benguet road, and seven over the Zig Zag. From the bottom to the top of the Zig Zag is just 1,600 feet in an airline. The road winds around and around the mountain until in some places seven different stretches of it may be seen below.

"On account of our deviation of route after the bridge incident of the first day, we were thought to be lost, and when we reached Benguet we found one of the passenger automobiles just about to start out on a hunt for us.

"The Hupmobile followed the schedule of the big cars up the stiff climb and landed in the mountain capital amid cheers and congratulations from numerous American friends."

Celebrated "Fourth" with Economy Tests.

Without the aid of fireworks the Brush Runabout Co., of Detroit, Mich., celebrated the "glorious Fourth" in a widely scattered series of 100 mile economy tests, Brush agents in various parts of the country being the participants. All reports of the tests have not reached headquarters as yet, but according to those so far received the simultaneous running of a great number of cars under identical rules and conditions evolved a winner with a performance of 48.4 miles per gallon of gasoline. This showing was made in Los Angeles, Cal., by Y. R. Del Valle, who used only two gallons and one-half pint of gasoline for the 100 miles. A. D. McClellan, of Oakland, Cal., made the next best showing. He used two gallons, one quart and one-half pint of gasoline for the 100 miles. Thirty-two other contestants averaged 25.9 miles per gallon, traveling at an average speed of 18.9 miles per hour. Economy of lubricating oil was equally as wonderful as the low consumption of gasoline. John Moore & Co., of New York City, and R. J. Hunt, of Trumansburg, N. Y., each covered the 100 miles on one-quarter of a pint of oil, which is equivalent to 3,200 miles per gallon. Each competing car carried an observer who was either an official or appointee of a recognized automobile club and in no way associated with the Brush company. In some cases, the dealers invited their own competitors to act as observers. Carburettor adjustments by three contestants and spark plug cleaning by three others were the only occasions for attention in the whole contest which so far have been reported.

STRONG PRAISE FROM FIRE FIGHTERS

He Gives Facts and Figures Concerning Springfield's Motor Fire Engine—Added Comfort for Men.

Most of the fire department men who have to do with motor driven apparatus are enthusiastic in its praise, but if any of them are more enthusiastic than Capt. A. H. Strong, of Hose Company No. 7, of the Springfield (Mass.) department, he has not raised his voice so that it could be distinguished.

Captain Strong has had charge of a Knox chemical engine ever since it was installed, nearly three years ago, and he therefore is in a position to know whereof he speaks, particularly as he has kept an accurate account of cost of both horse and automobile service and also the proportionate number of times each has been immediately available to answer calls.

"For the two years and nine months the Knox chemical engine has been in service," he says, "the entire cost of upkeep has been \$385.60, which includes tires, repairs, gasoline, oil and batteries. Of this amount \$315 has been for tires.

"The car has made 398 runs and the runs average about two miles. The reason our tire cost is so great is that we contract for tires by the year. In the 398 calls there were but five times when the car was not immediately ready; however, we were never delayed longer than five minutes.

"The cost of keeping a horse in a fire house in Springfield is \$240 a year, which includes feeding, shoeing and ordinary expenses, but does not include wear on floors and stables, caused by the sharp calks of the horses' shoes; nor does it include plumbing, maintenance of harness or apparatus, nor depreciation of horses. The first cost of a fire horse is from \$250 to \$300 and the average life is five years.

"Besides, there is an exercise wagon which, while costing comparatively little, requires space in the engine house. There is about one hour each day when horses are not available for quick response to fire alarms on account of being out exercising.

"Each team requires a driver, at a cost to the city of \$1,095 a year. This man is not available for fire fighting, as he must remain with his horses at all times.

"Summing up the comparative cost: A horse-drawn chemical engine in two years and nine months cost in round numbers \$5,000 to maintain, as against \$385 for the motor chemical, and our chemical hardly has the new worn off yet. In estimating the yearly cost of the horse-drawn engine, the driver's wages are included because the driver is not and cannot be, a fire fighter, while the driver of the motor chemical engine is a fire fighter.

"To a city, the least thing to be considered is the cost of its fire fighting apparatus, and in spite of the showing we have made, I consider it the least of the many advantages which the motor apparatus has over the horse-drawn.

"Speed, with safety and reliability, are the chief things to be considered in the equipment for fire fighting. All the apparatus from the outlying districts of a city can be quickly concentrated on a big fire in an incredibly short space of time when the motor fire engine is universally adopted. When that time comes it will not be necessary to have engine houses so near together as at present.

"Equipment can be increased without additional cost of buildings, as two pieces of motor apparatus will be accommodated in the same floor space as is necessary for one piece of the horse-drawn. Horses are much more liable to accident than automobiles, and in a sudden sleet storm, deep snow, hills, icy going, or long runs, the automobile shows to great advantage over the horse.

"The comfort and convenience of the fireman is not a small matter. Where there are horses there also are flies, flees and mosquitos, and as firemen cannot be hampered with screens this phase of the fireman's life is worth consideration.

"One of the biggest fires we have had in Springfield for years got under headway before it was discovered; it required that a general alarm be sent in. The horses that should have arrived first were delayed some minutes by the slipping and falling of one on the icy pavement. Our machine was on the scene and had water on the fire before any of the apparatus from the nearest houses arrived, although we were twice as far away."

Rust Where There Should Be None.

It not infrequently happens that when cars are disassembled during the course of an annual overhaul, or to make minor repairs, spring shackle bolts are found to be rusty in spots, showing that they have been imperfectly lubricated. The same trouble may be discovered in the steering connections and, in fact, in almost any part of the car which is lubricated by means of grease and grease cups. And this in spite of the fact, that the plungers of the several grease cups have been religiously screwed down at stated intervals. Generally the trouble is caused by the use of grease which is too heavy. If the grease passages are small and very hard grease is used, instead of being forced to the "seat of action" as it should be, it simply squeezes past the plunger of the grease cup, and unless the operator is extremely careful he is none the wiser. Obviously the remedy is embraced in the use of slightly lighter grease, though in this respect it should be remembered that if very much lighter grease is used it is likely to thin out under the action of the sun.

HERE'S A TELESCOPIC UNIVERSAL

Old Idea Applied to Automobile Construction—How it is Worked Out and the Purposes Served.

Introduced by the Patented Specialties Co., 222 Kimball Building, Boston, Mass., by which firm it also is manufactured, The Two-in-One Telescopic universal joint which is shown in the accompanying illustration is of particular interest in that it obviates the necessity for a short floating shaft and two universal joints such as are

at present required in coupling two rotating shafts which are out of line. Appearances often are deceptive and it may not generally be known that with the ordinary type of universal joint the shafts which are coupled actually are "in line" though they may not appear to be, which is to say that if the shafts were lengthened they would meet at a common center which would be the center of the universal joint. When it is not possible to place them in these relative positions it is necessary to use a short shaft between them with a universal joint at each end of it.

Owing to the construction of the Two-in-One Telescopic universal joint, however, it is not necessary that two shafts which it is desired to couple be in line. As may be seen in the illustration, the Two-in-One joint is not unlike the orthodox universal joint in appearance; in operation it also is similar in some respects, though in construction it is distinctly different. Like other universals, it is composed of two

yokes which are fastened to the ends of the shafts which are to be coupled, though unlike others, means is provided for a lateral movement between the yokes, the amount that the coupled shafts may be out of line being governed by the amount of this lateral movement. The joint is made in two styles, style A being substantially as described, while style B is exactly similar to it in other respects, and in addition the center block, which which in the other is solid, is made in halves which fit into each other permitting a telescopic movement at this point in addition to the lateral movement which is allowed between the yokes. It is claimed that the device accomplishes its object without undue friction and with absolutely no lost motion.

Cooks Produce a Transmission Lubricant.

As between ordinary lubricating oil and ordinary grease the prevention of friction in the gearbox is rather a difficult matter to accomplish. Oil, while permeating every part satisfactorily tends both to drain off when the active parts are at rest, and to be thrown off by centrifugal force when they are in motion. Grease, on the other hand, while more adhesive in its properties than oil and, therefore, less liable to be thrown off the revolving surfaces, does not penetrate the meshes of the teeth, but is apt to be furrowed by them and merely swept aside. Cook's Auto Transmission lubricant, which Adam Cook's Sons, of New York City, have added to their productions and now are introducing, has been compounded with the object of overcoming both sorts of difficulty. It is designed to flow over extended surfaces in the form of a thin film with the freedom of motion of an oil, at the same time resisting the centrifugal tendency, and acting as a cushion between the teeth to deaden the shock of impact as well as to prevent the actual tooth to tooth contact which results in friction and abrasion.

Pedersen Evolves New Oil Indicator.

Sight-feed indicators that are subject to the splashing of oil on the glass, or that fill up on the slightest provocation, even when the oil leads are not choked, are not always held in high respect by the motorist. Their value is lost because they are deemed untrustworthy. In seeking to avoid these difficulties simultaneously, the Pedersen Lubricator Co., of New York City, has developed a new form of dash indicator, in which a cylindrical body, set at an angle to the face of the dash, contains the single drip feed. As the front, which is the only part of the device made of glass, is inclined away from the drip, there is no chance of the glass being spattered or clouded, even when the car is tipped on steep grades, while the lower part of the glass is far enough above the outlet so that oil will not back up against it unless the outlet is absolutely blocked.

F & S

Ball Bearing Catalog for 1911

The illustration below is a half size photographic reproduction in black and white of the cover of the 1911—F & S Ball Bearing Catalog. The original of the cover is of heavy gray card-board bound with silk cord and tassels. The printed title is heavily embossed in black and white, and black and green, the whole a fine example of the German Printer's art in English text. The text consists of 134 pages printed in black on heavy coated paper, with borders in brown. The illustrations of the bearings are from original wood cuts, not half-tones, which always show a distorted circle; the only half-tone cuts in the book being views of the

great German Plant at Schweinfurt a/M where F & S bearings are produced. The valuable and handy tables in the book consist of load tables expressed in kilos and R. P. M., diameters, bores, radii in mm., and number of and diameter of balls in the single and double row annular type. Other tables show the details of Single and Double Thrust Bearings, Plummer Blocks of various types and Hanger Bearings, besides a page of complete directions for mounting and lubricating F & S Ball Bearings.

This catalog de luxe of the world's quality ball bearing is free by mail for the asking. May we send it to you?

Our own Engineering staff and the capable staff of the German Plant are at your service, and are prepared to take up with your own departments in this line, any ideas or suggestions that might be indicated by you for your future wants.

Send us your blue prints, specifications and photos, and we will submit without charge, a blue print of a detailed ball bearing construction to replace your plain bearing journal.

Recent Patents

987,772. Horn for Use on Motor-Cars and the Like. Benjamin Swan and Ernest Edgar Stuart, St. Albans, England. Filed June 17, 1910. Serial No. 567,387.

1. In a sounding horn, the combination, with an air compressing pump provided with a piston, and an air tube connected to the pump cylinder and provided with an outlet port, of a sounding trumpet connected to the said tube and its port, and a piston valve connected to the said piston and slidable in the said tube to open and close its port.

987,801. Valve Mechanism for Explosion-Engines. Charles R. Greuter, Saugus, Mass. Filed Apr. 17, 1909. Serial No. 490,482.

1. In combination, a cylinder head having an inward taper in longitudinal section to the valve seat forming at the extremity of said taper a valve seat, a tubular exhaust valve of hourglass form adapted to engage said seat, the co-operating portion of said valve being formed on a taper merging into that of the cylinder head, and a second valve adapted to seat on the end of the tubular valve.

987,806. Antiskidding Device for Vehicle Wheels. Ora B. Kibby, Cincinnati, Ohio, assignor of one-half to Edgar J. Moch, Cincinnati, Ohio. Filed Feb. 23, 1910. Serial No. 545,335.

1. In an anti-skidding device for vehicle

wheels, the combination of a pair of side clamp-plates having bearing-faces thereon for the sides of a spoke and felly of a wheel adjacent to the joint between said spoke and felly adjacent to said joint, clamping means between said mated clamp-plates acting laterally on said clamp-plates for clamping said spoke and felly with lateral pressure between said clamp-plates, and a flexible tread-member having releasable attachment with said plates, substantially as described.

987,833. Vehicle Spring. Arthur R. Selden, Rochester, N. Y. Filed Aug. 15, 1906. Serial No. 330,738.

1. In a vehicle spring device, a vehicle body composing one part thereof, a wheel carrier composing another part thereof, means for preventing tilting and longitudinal movement of one of said parts with reference to the other, a link pivoted to and depending from one of said parts, a balance bar pivoted between its ends to the free end of said link, and a pair of springs attached to the other of said parts having one spring connected with the inner end of the balance bar and the other spring connected with the outer end of the balance bar.

987,843. Headlight Controller for Vehicles. Clarence E. Walters and Alva M. Walters, Red Oak, Iowa. Filed Oct. 3, 1910. Serial No. 585,055.

The combination with an automobile comprising a front axle, knuckle joints at each end of said axle, steering wheels on said knuckle joints, longitudinally extending springs secured to the top of said axle and longitudinally extending side frame bars having their forward ends secured to

said springs, of laterally extending bearing members secured to the tops of said bars; lamp brackets having vertical stems extending through said bearing members, one of said stems being continued below the corresponding spring; a guide member secured to side of the corresponding spring and loosely embracing said extending stem; a connection between said brackets for causing them to rotate in unison; a forwardly extending arm secured to the lower end of said extending stem; a forwardly extending arm secured to the knuckle joint on the side opposite said extended stem; a link connecting said arms, said link extending laterally and inwardly from said knuckle arm parallel with said axle, then forwardly and then laterally and outwardly to said stem arm; and a supporting arm secured to said front axle and slidably engaging said link, substantially as described.

987,954. Multiple Disk Clutch. Alanson P. Brush, Flint, Mich. Filed Jan. 12, 1910. Serial No. 537,623.

1. In a multiple disk clutch, the combination of a rotatable driving member carrying an annular vise jaw, a co-axial driven member, a series of friction disks embracing said driven member and having a sliding torque-transmitting engagement therewith, a disk carrier slidably mounted on the driving member and having a flange which overhangs said driven member, a series of disks within said flange having a sliding torque-transmitting engagement therewith, a vise jaw fixed to said flange, and means for moving said disk carrier longitudinally.

987,977. Shock Absorber. Phelps M. Freer, Rochester, N. Y., assignor, by mesne assignments, to The Connecticut Shock

AUTOMOBILE AXLES—1912

We have issued an axle catalogue containing dimension drawings of 1912 axles.

A copy of this catalogue will convince you we have the finest line of automobile axles, and the best designed line of automobile axles entering the construction of high grade cars.

BEARINGS

We earnestly recommend annular bearings, because they are 100 per cent. good, and will last as long as the car when properly applied—as we apply them. They are fool proof. Annular bearings cost but little more than roller bearings and are 100 per

cent. better than any adjustable bearing. Annular bearings are the best insurance against bearing trouble, and add great value to the whole car. We make cup and cone bearings of annular steel, and can supply taper roller bearings of annular steel, but we recommend annular ball bearings as they are 100 per cent. good and are fool proof. We have not had to replace one in three years.

THE McCUE COMPANY, Hartford, Conn.

Absorber Company, Meriden, Conn., a Corporation of Connecticut. Filed Jan. 13, 1910. Serial No. 537,971.

1. In a shock absorber comprising two relatively rotatable parts, one part comprising a cam, the other part comprising a case surrounding and supporting said cam, a lever arm carried by each part and projecting laterally therefrom, said cam having a plurality of high points, a plurality of springs arranged to be flexed by the rotation of said cam, said springs being carried by said case and a connection between the cam and its lever arm comprising an angular block extending concentrically into the cam, said cam having an angular recess to receive said block wherein said block is held against rotation independently of the

cam, and means for connecting said lever to the outer end of said block.

988,229. Automobile Spring. Charles Arthur Tilt, Chicago, Ill., assignor to John W. Blackledge, Chicago, Ill. Filed Oct. 9, 1909. Serial No. 521,808.

1. The combination with the two members of a vehicle elliptical spring, of two pairs of vertical guides, means for securing the end of the lower member of the spring between the pairs of guides, two pairs of sleeves surrounding said guides, means for pivotally supporting the end of the upper member of the spring between and directly by the pairs of sleeves, a plate secured to the lower ends of said guides, and coiled springs surrounding said

guides and supported intermediate of said plate and said sleeves.

988,305. Tire Holder. Weston F. Bright, Springfield, Mass. Filed Sept. 23, 1910. Serial No. 583,339.

1. In a tire holder, the combination with a suitable support, a frame element attached to said support, the upper portion of the frame being provided with a plate for supporting the weight of a tire rim, and the lower portion of the frame having means secured thereto for receiving the rim, and means interposed between said tire receiving means and the plate for clamping the rim in place and against displacement.

J. S. BRETZ COMPANY, 250 West 54th Street, New York, N. Y.

Mass., assignor to Newcomb Engine Company, New York, N. Y., a Corporation of New York. Filed Sept. 7, 1907. Serial No. 391,759.

1. An internal combustion engine of the compression type, including means for supplying charges of air to the piston chamber, means for supplying variable charges of a liquid fuel to said chamber during periods beginning subsequently to the beginning of the air supplying periods, means in said chamber for regulating the extent of the diffusion of the fuel in the air whereby variable portions of the air charges are effectively carbureted at or near the ends of the compression periods, and means for igniting the carbureted portions of the air charges at predetermined periods, whereby substantially complete combustion of the fuel may be effected at the instants of maximum compression.

988,417. Vehicle Cushioning Device. Peyton West, Springfield, Ohio. Filed Dec. 27, 1910. Serial No. 599,477.

In a cushioning device for vehicles, the combination of a vehicle running gear, an air cylinder supported upon an axle of said running gear, a piston in said cylinder, a rod extending from said piston, a ball socket attached to the end of said piston rod, a ball member in said socket forming a universal joint therewith, said ball member terminating in an extended flange, and a bearing attached to the running gear frame and in which said flange is slidably mounted, and whereby there are provided two yielding joints between the running gear of the vehicle and the piston rod, substantially as and for the purposes specified.

988,448. Oscilating Device for Motor Vehicle Wind-Screens. Jacob W. Earl, Los Angeles, Cal. Filed Nov. 3, 1908. Serial No. 460,813.

1. In a device of the class described, a wind screen divided into an upper section and a lower section hinged together, said screen being pivotally mounted on the motor vehicle, and brace rods pivotally secured to the vehicle frame and having a pivot connection with said upper section, said pivot connection being located at one side of the hinged edge of the upper section.

988,502. Carburetter. Louis J. Petre, East Cleveland, Ohio. Filed Dec. 28, 1907. Serial No. 408,371.

1. In a carburetter, the combination of a carburetting chamber, having an opening in the bottom thereof, an elbow projecting downwardly from said opening and provided on its lower surface with a threaded seat, a cylinder threaded onto said seat, a valve on the upper end of said elbow and having a stem projecting into said cylinder, a piston on said stem, a spring interposed between said piston and said seat, a valve controlling the supply of fluid fuel to said chamber, and connections whereby said valves may be operated simultaneously, substantially as specified.

988,563. Pivot Light for Automobiles. Harry C. Frandsen, Concord, Cal. Filed Dec. 5, 1910. Serial No. 595,582.

1. The combination of a lamp bracket, having a vertical stem, a sleeve bearing of considerable length in which the stem turns, said sleeve bearing having an offset flange for attachment to a part of a vehicle frame, the stem carrying a pinion, a rack engageable with the pinion, and reversible means to hold the rack against the pinion capable of being inserted between the rack and

pinion to lock the latter against turning without interfering with the reciprocating movement of the rack.

988,607. Power Transmission Device. William Waring, Quincy, Mass., assignor to National Brake & Clutch Company, Boston, Mass., a Corporation of Maine. Filed Oct. 20, 1910. Serial No. 588,169.

1. A power transmitting device comprising an endless belt, and a series of blocks attached to said belt and provided with sockets in their opposite ends and with facing pieces of flexible fibrous material having holes in line with said sockets, and corks inserted into said sockets and extended through said facings substantially flush with the outer surface thereof, substantially as described.

No. 4.

DURANT ASSISTING NEW VENTURE

His Former Lieutenant Admits He is Interested in Chevrolet's Car—Factory Leased and Company Forming.

That W. C. Durant, once the head of the Buick Motor Co., and the man who engineered and until a few months ago dominated the General Motors merger, is engaged in assisting another automobile venture, if he is not actually preparing to cast loose from the General Motors Co., there now appears to be no doubt.

William H. Little, at one time factory manager for the Buick company, who later figured as Durant's assistant in New York, is authority for the statement that Durant is aiding him in the formation of what will be styled the Chevrolet Motor Car Co., of Detroit, which will manufacture a high powered speed car designed by Louis Chevrolet, the well known racing driver. The company probably will be capitalized at \$750,000, and according to Little, Durant will be one of its officers, or at any rate, he can be one, if he so desires. Some other of the original Buick stockholders also will be connected with the new enterprise, it is stated.

The first definite move has been made by the leasing of the factory on West Grand boulevard, in Detroit, which now is occupied by the Corcoran Detroit Lamp Co., which affords 75,000 square feet of floor space. The lamp company will vacate the building about August 1st and remove its equipment to its parent plant in Cincinnati.

"While I am organizing the company and Mr. Durant is aiding me in every way, we will have a closed corporation, in a way, and have more money at our disposal than we will need; in fact, we are in a position to select our stockholders, which we will do," Little is quoted as saying.

"We are not ready to give out the particulars as to the car we will place on the

market, but while it will compete in a general way with the General Motors company, it will really invade a special field.

"I expect that we will incorporate in this state and that the capital will be of a large amount. The lease we have taken on the plant of the Corcoran Lamp company is simply a temporary matter and not the ultimate idea we have in mind."

Whether the "ultimate idea" includes another merger, which it now is known Durant was seeking to effect, remains to be seen.

Recovers Rent from Royal Tourist.

Judgment for \$1,012 was entered in New York last week against the Royal Tourist Car Co., of Cleveland, Ohio, in favor of the General Vehicle Co., of New York, that sum representing unpaid rent and accrued interest of the premises in the Motor Mart, at Broadway and 62d street, which were occupied by the Royal Tourist's New York branch. The store was subleased by the General Vehicle Co. to the Royal Tourist company at an annual rental of \$5,500, and suit was brought when the latter failed to meet the March and April payments. The summons was served on George J. Dunham, president of the Royal Tourist company, when he was in New York on June 20 last.

Order Countermanded; Sues for \$105,000.

Because the Velie Motor Vehicle Co., of Moline, Ill., countermanded an order for 1,000 motors, the Armstrong Iron Co., of Racine, Wis., has entered suit in the United States Circuit Court in Peoria, Ill., for \$105,000. The Armstrong company alleges that the contract called for the delivery of the motors at the rate of 60 per month and at a price of \$210 each, but none had been delivered when the order was countermanded. The plaintiffs state, however, that they already had altered their plant and incurred other expenses to the amount of \$45,000, and they are suing to recover this sum plus \$60,000 profit, which they allege the contract, if carried out, would have netted them.

SPHINX ACQUIRES A SLIDE VALVE

Berg Conveys Reno-Bois Rights to New Licensing Company—Saurer Truck Officials Prominent in Project.

Hart O. Berg, who revisited America early this year to exploit the Reno-Bois slide valve engine, did not return to Paris without having achieved results. None of the various manufacturers who were invited to examine the engine adopted it, but men identified with the Saurer Motor Co. became sufficiently interested to form an American company to acquire the Reno-Bois patents for the United States, Canada and Mexico, and this company, the Sphinx Motor Co., a Delaware corporation, with offices in New York, is now ready to grant licenses for the use of the engine on this side of the water.

The officers of the Sphinx company are: President, C. Philip Coleman, who is president also of the Saurer Motor Co., and who at one time was vice-president and secretary-treasurer of the Singer Sewing Machine Co.; treasurer, D. W. Yeckley, who is treasurer also of the Bayonne Steel Casting Co.; secretary, Vernon Munroe. The directorate is composed of C. P. Coleman, W. D. Sargent, Wm. A. Redding, Harry W. Davis and Arthur H. Lockett.

Messrs. Sargent and Lockett, like Mr. Coleman, are directors of the Saurer Motor Co., and Mr. Redding is a well known attorney, with whom Hart O. Berg was in frequent consultation while he was in New York. The New York offices of the Sphinx company are in room 2006 of the Hudson Terminal building, which is also the office of the Saurer Motor Co., which only a few months since acquired the American rights to the Saurer truck, which is being built in Plainfield, N. J.

While designated as a sleeve valve motor, the Reno-Bois construction is not to be confused with that of the Knight engine and kindred types, in which the valve mem-

bers are in the nature of movable cylinder liners which surround the piston. The single valve which is used in the Reno motor is mounted in the upper part of the cylinder, above the range of piston travel. Its vertical movement alternately uncovers and covers the inlet and exhaust ports, which are located in the walls, the action being closely similar to that of certain forms of piston slide valve employed in steam engine construction. The valve is in the form of a split ring and therefore yields to the expansion and contraction of the cylinder. It is actuated by means of a short walking beam which projects through an opening in the side of the cylinder casting, the valve being hooded over the end of the beam to prevent the escape of gas. A tappet rod and cam system serves to deliver motion from the cam shaft at the side. Under test, one of the engines measuring roughly $3\frac{11}{32} \times 5\frac{1}{8}$ inches, is claimed to have developed 28 horsepower at 1,350 revolutions.

In France, the Reno engine is used by Georges Richards, and in Germany by the N. A. G. Co., the motor department of the Allgemeine Electricitaets Gesellschaft.

Taxicab Company to be Reorganized.

Francis C. Huntington, receiver in bankruptcy of the Cab & Taxi Co., of New York, of Nos. 252 to 262 West Fortieth street, has obtained an order from the United States Court confirming the sale of the entire assets of the company to Belvidere Brooks, W. B. Lasher and T. Tileston Wells, the reorganization committee. The assets were appraised at \$374,429 as a going concern and at \$218,501 at a forced sale. The liabilities are about \$3,000,000, of which \$93,000 are to the first mortgage bondholders and \$2,500,000 to second mortgage bondholders.

The plan of reorganization provides for a new company with capital stock \$1,700,000, of which there is to be first preferred \$200,000, second preferred \$250,000, and common \$1,250,000. There is also to be a bond issue of \$250,000 to provide ready money. The stock is to be distributed as follows: To first mortgage bondholders, \$183,000 first preferred stock; general merchandise creditors, \$225,000 second preferred stock, and to second mortgage bondholders, \$1,250,000 common stock at the rate of 50 cents for each dollar of bonds. For those who do not accept the plan it is provided to pay general creditors 10 per cent. of their claims in cash and to second mortgage bondholders 3 per cent. cash.

Tops Bring Small Price at Auction.

Under a trust mortgage given for the benefit of creditors of the United States Auto Top Co., 961 Beaubien street, Detroit, Mich., the concern's stock on hand was sold at public auction on Saturday last, 15th inst. Although valued at \$950 it was sold for \$275 to W. Rippey.

ADOPTS "FREE INSPECTION" PLAN

**United States Motor Co. Applies it, for First Time, to Low Priced Cars—
What it Includes.**

Although the system of periodically inspecting cars after they have been purchased long has been pursued by a number of the better known manufacturers of high priced cars, and is carried out with great thoroughness by some of them, for the first time the system is to be applied to cars of the popular priced types, the United States Motor Co. having adopted what is termed a "satisfied owners' policy," which entails the free inspection of its numerous and varied productions, including even the \$350 Liberty-Brush runabout.

According to the plan as outlined, any purchaser of a Columbia, Maxwell, Stoddard-Dayton, Courier, Liberty-Brush or Brush car or a Sampson truck, may have it inspected by the United States company's dealer or branch house, as often as once a month, if necessary, for one year without charge. The system, however, does not carry with it free repairs or replacements. To quote the language of the official announcement, it means that "the owner of one of the cars is assured of knowing just what is required to have his car working at its most efficient point, and while months may go by when the car will not need attention, the owner will have the privilege during the first year, of taking it to the dealer for inspection, while reasonable adjustments of the carburetter and magneto will be made without charge of any kind." The plan becomes effective August 1st.

Church Sells His Agency Contract.

Norman W. Church and F. W. Flint, who comprise the Stoddard-Dayton Motor Car Co., of San Francisco and Los Angeles, have disposed of their interests to the United States Motor Co., and Church, who was one of the pioneers of the industry on the Coast, will retire from business for at least a year. The Stoddard-Dayton Motor Car Co. held the agency for that car for the entire Pacific Coast, the contract having been executed with the Dayton Motor Car Co. before the latter was taken over by the United States company; the contract had four years to run, and to obtain control of the territory in order to reapportion it, the United States Motor Co. bought the contract for a round sum. Church came to New York last week to close the transaction.

Gillett Extends His Vulcanizing Business.

Charles M. Gillett, proprietor of the Gillett Vulcanizing Co., of Springfield, Ill., has extended the business by establishing branches in Decatur and Bloomington, Ill.

To conduct the establishments in each of these cities separate corporations have been formed under Illinois laws. For Decatur the incorporators are Robert R. Munsie, Walter H. Weaver and C. M. Gillett, while C. M. Gillett, K. P. Phares and F. M. Rossa form the Bloomington company. The head office of the three companies will be in Springfield.

Forse Speedometer Changes its Location.

To secure the removal of the Forse Speedometer Co. from Anderson, Ind., to Pendleton, in the same state, a new company of that name has been organized and incorporated, with \$25,000 capital. It has secured the Motsinger factory building in Pendleton and will take possession this week, employing twenty-five operatives at the outset. Messrs. Forse, Allen, Toner and other Anderson men retain an interest in the enterprise, the Pendleton stockholders being Will and Walter Swain, Fred Lautz, D. B. Cole and J. J. Rogers.

Zenith Secures a Plant in Detroit.

The Zenith Carburetter Co., which was organized some four weeks since in Detroit, to manufacture the French carburetter of that name in this country, has leased the fourth floor of the Dodge Power building in Detroit, where it is making ready to begin operations under R. D. Heftler, the manager of the American company. Work will be started with about 40 men, some of whom will be brought from the French factory.

Charlotte Men Acquire a Carburetter.

R. Crofoot, Fred Bintz, Bert Patton and M. K. Miller have organized the Charlotte Carburetter Co. in the Michigan city of that name, for the purpose of manufacturing a carburetter invented by James Whitcomb, of Charlotte, which was patented in March last. Miller, who has had the necessary experience, since he has been testing and perfecting the device, and the results he obtained led to the purchase of the patent.

Cadillac Prepares Again to Enlarge.

Having acquired the necessary land, the Cadillac Motor Car Co. is about to erect several additional buildings adjoining its present plant in Detroit. They will comprise an addition to the iron foundry, 220 x 72 feet, a new brass foundry, 140 x 50 feet, and a new three-story manufacturing building, 270 x 60 feet. Two additional stories will be added to the body building plant also, 428 x 60 feet, and 60 x 76 feet.

To Sell Otto Assets at Auction.

By order of the court, the assets of the bankrupt and short-lived Otto Motor Car Co., of New York, will be sold at public auction on Wednesday next, 26th inst. The property consists of one new car, three old ones and a lot of accessories and office furniture and fixtures.

REVISED GARAGE RULES RIDDLED

Shot to Pieces at Long Public Hearing and Will be Redoctored—Some Unusual Situations Disclosed.

Before the revised and specifically extensive garage regulations drafted by the Municipal Explosives Commission of the City of New York are enacted they will have to undergo considerable re-revision. This was made manifest during the public hearing, which occupied Monday and Wednesday of this week, at Fire Headquarters, 157 East 67th street. Each of the 62 sections of the regulations was discussed and less than one-sixth found favor.

In the very beginning Alfred Ely, representing the Automobile Club of America, which conducts the largest garage in New York, told the Commission that the adoption of the rule forbidding the storage of more than one car or one gallon of gasoline in a building in which cigars or cigarettes are sold would compel the club to go out of business and be equivalent to confiscating its property, valued at \$1,500,000. The full text of the rules was published in *The Motor World* of June 22.

The hearing was attended by representatives of the majority of those interested in the automobile industry in New York, and they came prepared to watch every section and clause. They made frequent requests for information and in many instances the Commission was unable to explain, and Inspector Kelly, of the Bureau of Combustibles was called upon to assist. This generally resulted in a lengthy discussion, of which memoranda were made by Secretary R. S. Lundy for the consideration of the Commission.

The first real snag was encountered in Section 2, a part of which requires the filing of a description and the maximum number of motor vehicles to be stored in a garage for which the permit is asked. Counselor Charles Thaddeus Terry, representing the Automobile Dealers' Association, Inc., and other organizations, said that this was an absolute impossibility. To describe the cars, he pointed out, would mean to furnish a description of every model ever made, because no garage owner could tell in advance what kind of a car he would be likely to store. Mr. Terry added he did not see the reason for a new set of garage rules, but that if the Commission desired to make changes in those now existing, he and those representing other automobile interests were prepared to co-operate in any manner that would assure the passage of rules satisfactory to both sides and all interests, instead of having rules that would have to be reviewed later by a court of law.

Gen. George O. Eaton, chairman pro tem of the Commission, replied that many of the new regulations were intended princi-

pally for private garages, which, in most cases, are a dangerous fire hazard.

Mr. Terry also objected to Section 3, which called for a detailed scale plan of the premises to accompany an application for a garage permit. "That," he said, "seems like an unnecessary hardship on the garageman and owner."

"Oh, I guess any man that can afford to have an automobile can afford to pay \$5 to have a scale drawn," remarked Commissioner Acritelli, who used to be a coroner, which fact apparently qualifies him as an explosives expert.

"That's right," quickly retorted Mr. Terry, "soak the automobile! The motorist pays for the roads, and whenever there is any money needed, why he is to be the ready and willing victim."

Things then went rather smoothly until Section 9 was reached. This is as follows:

"All garages wherein volatile inflammable oils are stored shall be continuously under the care and supervision of one or more persons each holding a certificate of fitness as a superintendent or manager of a garage. The number of persons required to hold certificates of fitness in each case shall be determined by the Fire Commissioner and shall be stated in the permit."

Arthur K. Wing, appearing for the Fifth Avenue Coach Co., the New York Transportation Co. and other large interests, said he thought making the holder of the certificate of fitness enforce the law was a bad thing, because a great many chauffeurs disregarded the law, and as a result the certificate men would lose their papers when such violations were discovered. Ex-Congressman William Willett, Jr., speaking for the Lincoln Square Garage, aroused great enthusiasm when he said the trouble was the lawlessness of the chauffeur.

"These men," said he, "threaten that they will take cars away from the garage the moment any one attempts to enforce the rules. One arrest and prosecution would solve the whole trouble. The garage owner is intimidated and the ideal thing would be to revoke the licenses of chauffeurs caught smoking in a garage. They hide in the limousines and sneak in behind cars to smoke, and no matter how many men there may be looking out, there is always some chauffeur who contrives to sneak away and get a smoke. You gentlemen can't imagine the kind of people we have to deal with as chauffeurs, the most impossible crowd on earth, thugs and thieves and burglars."

The applause that greeted his remarks showed that there were many there who felt the same way about it. It was pretty well established that if the penalty were put on the chauffeur and not on the superintendent of the garage it would be easier to enforce the law. Sidney B. Bowman said that the certificate of fitness idea took the business out of the hands of the owner and placed him at the mercy of his employee.

The chauffeur was brought in again when Section 29 was read. This covers the man-

ner in which the outlet for drawing off gasoline should be protected. The Commission wants it enclosed in a compartment having a self-closing iron door, which must be kept locked when not in actual use. When asked by Mr. Terry as to the reason for having it kept locked, Commissioner Acritelli said it was to prevent the chauffeurs from drawing gasoline to wash their tools.

The use of oil separators in garages took up considerable time. A number of those present claimed that during their experience they had found none that would fill the requirements. Mr. Ely stated that there was one in use at the Automobile Club, and Gen. Eaton said the Commission already had examined several and found one that was good. He also said others would be examined, and that he felt sure the Commission would approve of at least three makes.

Declaring the fusible plug question entirely a manufacturers' consideration and non-enforceable, attorneys Terry and Wing opposed the clause requiring the use of such devices on all tanks. Even were local machines properly equipped, tourists' machines could not be garaged, it was claimed. Inspector Kelly was sure that difficulty could be obviated by emptying the tanks of such cars. How that would satisfy the requirement he failed to explain.

Several sections were designated by attorneys representing various corporations and individuals as being illegal, particular stress being put on Section 61, which provides for a charge of \$5 on every car stored in a certain garage. The lawyers held that the statute covers license fees and no separate branch of the City's government has the right to impose an extra charge. Some of the other sections, it is claimed, already are covered by acts of the legislature, and if adopted by the Commission will be subject to action at law. The Commission stated that no section would be approved until sanctioned by the Corporation Counsel.

E. C. Morrison, secretary of the International Acetylene Association, objected to designating the quantity of calcium carbide that should be stored in a garage, as there was pending an ordinance covering the subject. Gen. Eaton requested the protest be put in writing and submitted as a brief within ten days for the Commission's consideration. Briefs also are to be submitted by S. F. Bowser & Co., makers of gasoline storage tanks, and the Hydraulic Oil Co., regarding sections covering the storage of oil and its distribution through buildings.

In behalf of the Bicycle Dealers' Association, Mark Eisner spoke of the effect of the regulations on motorcycles and requested the Commission to separate them from the general restrictions governing motor vehicles. He pointed out the fact that if the regulations applying to garages, repair shops, etc., were made to include motorcycles, they would take away from

the members of the association a business which at best is run on a close profit. Mr. Terry also spoke on the subject. He called attention to the fact that the Legislature made exceptions at times by not including motorcycles in the motor vehicle class.

Commissioner Sidney Harris and J. Howard Wainwright, the Commission's chemist, were interested listeners. They made many notes, and occasionally Mr. Wainwright was called upon to explain some point.

After the meeting adjourned Gen. Eaton unofficially said that he thought many of the sections would be changed as requested. However, the matter will be under consideration for some time, and no immediate action is likely.

Minnesota Requires Dates on Tires.

Although it practically escaped notice at the time of its passage by the legislature, there went into effect in Minnesota on the 1st inst. a law which, more or less radically, affects all manufacturers of automobile tires by requiring that such tires shall be branded with the year of their manufacture. This novel law is as follows:

"No person shall sell any rubber tire or casing for use on motor vehicles unless the name of the manufacturer and the year in which the same was made are conspicuously and permanently marked thereon in raised type cast with the tire or casing."

The second section provides that a violation of the act makes the seller of such unbranded tires guilty of a misdemeanor.

Although all of the dealers and branch houses in the State had supplies of such unbranded tires in stock when the law went into effect, no effort has yet been made to hold them responsible for selling the goods.

Leavitt to Reopen in Los Angeles.

J. W. Leavitt & Co., of San Francisco, who are among the largest and leading jobbers on the Pacific Coast, will open a branch house in Los Angeles on August 1st. They have leased the premises 1210-12 South Olive street for the purpose. Several years ago Leavitt was a member of the firm Leavitt & Bill, which did business in Los Angeles, and when the firm dissolved he took over its interests in San Francisco while Bill retained the Los Angeles house. Leavitt & Co. now have the Overland representation for the Coast.

More Branches for Stewart Speedometer.

The Stewart & Clark Mfg. Co. has established two more branch offices—one at 1825 Grand avenue, Kansas City, in charge of Harry E. Weber; the other at 514 North Capitol avenue, Indianapolis, in charge of L. L. Banford. Both men have represented the Stewart speedometer in their respective territories for some time. The branch offices will take care of the business only in the two cities named; the territory adjacent thereto will continue to be handled from the Stewart headquarters in Chicago.

Detroit, Mich.—Williams Garage Co., under Michigan laws, with \$3,000 capital; to operate a garage and renting service.

Detroit, Mich.—Universal Accessories Co., under Michigan laws, with \$25,000 capital; to manufacture and deal in automobile accessories.

Chicago, Ill.—Edison Storage Battery Co., under Illinois laws, with \$5,000 capital. Corporators—W. C. Anderson, Wilson Critzer, Frank E. Price.

Detroit, Mich.—Hanson Die & Tool Co., under Michigan laws, with \$10,000 capital. Corporators—Frank Hanson, Fred G. Morhouse, William E. Metzger.

Chicago, Ill.—Chicago Motor Transportation Co., under Illinois laws, with \$100,000 capital; to do general automobile livery business. Corporators—John J. Nolan, Arthur Bird Haven, Peter Sinclair.

Birmingham, Ala.—The Highland Garage Co., under Alabama laws, with \$5,000 capital; to do a general garage business. Corporators—H. J. Hooper, president; G. G. Sharpe, secretary.

Louisville, Ky.—Willand Co., under Kentucky laws, with \$6,000 capital; to deal in automobiles. Corporators—T. J. Willand, 63 shares; William P. Hines, 10 shares; George Reese, 10 shares.

Rochester, N. Y.—Rochester Steel Casting Co., under New York laws, with \$50,000 capital; to manufacture steel castings. Corporators—F. C. Kimmel, P. V. C. Jackson, J. C. Emery, all of Rochester.

Chicago, Ill.—Lyra Garage Co., under Illinois laws, with \$5,000 capital; to do general automobile and garage business. Corporators—G. R. Whomes, A. Henning, L. W. Whomes, R. G. Whomes.

Bristol, Conn.—Bristol Auto Delivery Co., under Connecticut laws, with \$2,000 capital; to maintain a motor delivery service. Corporators—Thomas P. O'Brien, James J. Callahan, Thomas O'Brien.

Portland, Me.—Triplex Tube Co., under Maine laws, with \$1,000,000 capital; to manufacture and deal in tires, tubes, and other rubber products. Corporators—E. J. Conner, C. F. Tennant, both of Portland.

Detroit, Mich.—Banta Motor Truck Co., under Michigan laws, with \$100,000 capital; to manufacture commercial motor vehicles. Corporators—Jacob H. Stoerckel, George H. Banta, Hiram P. Stalker, Daniel P. Cassidy.

Kansas City, Mo.—Automobile Engineering Institute of Kansas City, under Missouri laws, with \$15,000 capital; to maintain automobile school. Corporators—William Dale, H. B. Clarkson, A. B. Clarkson.

Kittery, Me.—Owners' Garage Co., under Maine laws, with \$500,000 capital; to own, buy, and operate garages. Corporators—President, R. A. Fessenden, Brookline, Mass.; treasurer, A. P. Browne, Cambridge, Mass.

Norwich, Conn.—Storing & Leasing Co., of Norwich, under Connecticut laws, with \$25,000 capital; to deal in real estate, automobiles and do trucking, etc. Corporators—W. A. Briscoe, Charles S. Eaton, John P. Huntington.

Pendleton, Ind.—Forse Manufacturing Co., under Indiana laws, with \$25,000 capital; to manufacture automobile accessories. Corporators—W. H. Forse, Jr., R. M. Allen, Linfield Myers, Fred Lantz, D. B. Cole, Austin Retherford.

Memphis, Tenn.—Six Thirty-eight Tire & Vulcanizing Co., under Tennessee laws, with \$4,200 capital; to maintain a tire repair establishment. Corporators—Walter Hunter, George F. Pope, R. D. Foley, Robert S. Polk, C. W. Hunter.

Chicago, Ill.—Start-Lite Co., under Illinois laws, with \$10,000 capital; to manufacture and deal in lighting, controlling and priming devices. Corporators—M. M. Dutton, Abraham L. Kanagy, William W. Butterfield, Howard H. Kanagy.

New York, N. Y.—Wilson Storage Battery Co., under New York laws, with \$200,000 capital; to manufacture storage batteries, etc. Corporators—F. D. Underwood, J. C. Stewart, of New York City; D. H. Wilson, Jr., of Meadville, Pa.

New York, N. Y.—Gardner-Matthews Automobile Manufacturing Co., under New York laws, with \$100,000 capital; to manufacture motors, motor vehicles, etc. Corporators—R. E. Matthews, M. D. Schneer, of New York City; J. W. Pascom, of Brooklyn.

Kittery, Mass.—The Holmes Motor Co., under Maine laws, with \$500,000 capital; to manufacture, contract for, deal in and repair gas engines, motor cars, motor boats, flying machines and any and every other vehicle requiring or using motive power. Corporators—L. B. Swett, G. E. Burnham, both of Kittery, Mass.

Recent Losses by Fire.

Monroe, La.—F. G. Hudson's garage destroyed. Loss, \$2,000.

Milford, Del.—William V. Sipple, Jr.'s, garage and one automobile destroyed.

Ottawa, Ill.—B. C. Zinkler's garage burned and one automobile destroyed. Loss, \$4,000.

Brooklyn, N. Y.—Rudd's Motor Garage, 938 Bergen street, burned; six automobiles and stock of accessories destroyed. Damage, \$20,000.

Increase of Capital.

Chicago, Ill.—Auto Renewal Co., from \$2,500 to \$25,000, and changes name to Taxicab Service Co.

John Hull, Jr., is building a garage at 285 Main street, Binghamton, N. Y.

Zent Bros. are erecting a garage at Roanoke, Ind. It will be opened August 1.

Cidric George is building a garage at Walton and Maurel streets, Fitchburg, Mass.

Jackson B. Kemper is erecting a fireproof garage at Lafayette and Summit avenues, Milwaukee.

O. R. and Wayne McHenry are building a garage on Chestnut street, near Forty-fifth street, Philadelphia.

Gullison & Ries have erected a garage at Humbolt avenue and Second street, Bode, Iowa. It will house 50 automobiles.

At a cost of \$4,000, L. W. Hicks is building a two-story garage on Fifth avenue, near Murral Hill, Pittsburg, Pa.

William L. Higgins is building a garage at the corner of Thirty-third street and Washington boulevard, Indianapolis, Ind.

The Union Auto Co., of Stuttgart, Ark., has taken over the interest of F. R. and R. L. Calvert in the Calvert Auto Co., in the same city.

J. M. Poorhouse has broken ground for a new garage at Owatonna, Minn., which will cost \$14,000. It will be 44 x 125 feet, one story high, of concrete.

Collingsworth, N. J., soon will have another garage. Earl Duff is building it on Haddon avenue, and expects to open it to the public on August 1.

A two-story brick garage is being erected on Lansing street, Little Falls, N. Y., by Leslie Rathbun and Harry Champion. The building will be 57 x 100 feet.

Y. N. Ralph is erecting a modern fireproof garage for L. Willard Mulford, at Nineteenth and Norris streets, Philadelphia. The building will cost \$10,000.

M. K. Kane has started work on a new garage on Franklin street, St. Paul, Minn. It will be of brick and fireproof construction and will cost, when complete, \$10,000.

K. Williams, who is described as a retired capitalist, has embarked in the automobile business in Pittsfield, Mass. He will handle Velie cars in all of Berkshire county.

Fred Hoffman, of La Crosse, Wis., and Louis Scheppke, of Melrose, Wis., have formed a partnership under the firm name of Hoffman & Scheppke, to handle the Ford car.

Ray Leeman has been appointed manager of the Goodyear Tire and Rubber Co. at

Houston, Texas. For some time Leeman was with the Overland Automobile Sales Co., in the same city.

J. A. Pugley & Co. are erecting a new addition to their garage in Prince William street, St. John, N. B. It will be a separate three-story building on a lot 100 x 150 feet, adjoining the present structure.

Work has commenced on a two-story reinforced concrete garage on Twentieth street, near Washington street, Portland, Ore. It will be 50 x 100 feet in extent and occupied by the Elmore Automobile Agency.

A petition in involuntary bankruptcy has been filed against the Reo Automobile Co., of Washington, D. C., by creditors whose aggregate claims amount to \$545. It is claimed that the company owes \$1,000 and is insolvent.

Fred Smith is building a three-story cement garage in the little village of Hibbing, Minn. It is the third garage in the place and will be in charge of George Smith, formerly machinist of the Carlson Exploration Co.

Ground has been broken for a four-story concrete garage for the California Motor Co., at present located at 727 South Olive street, Los Angeles. The new building will be 70 x 160 feet, at the corner of Tenth and Hope streets.

The Blakeslee-Britten Co., of Newark, N. J., has opened a service building for Mack trucks, at 558 East Ferry street. The structure is 50 x 125 feet, and is designed to accommodate even the largest and heaviest trucks made.

The University Garage is the style of a building at University avenue and Marion street, St. Paul, Minn., recently erected by R. H. Deppe and C. J. Kramer. It houses Maxwell and Columbia pleasure cars and Sampson trucks, exclusively.

The Allerton Auto Co. has leased the Kidd building on Central avenue, Allerton, Iowa. They will make extensive improvements and move from their present location August 1. A complete line of automobiles and accessories are handled by the company.

The Krebs-Gotshall Motor Co., of Denver, Colo., has succeeded the Krebs-Campbell Automobile Co., the interest of Campbell having been acquired by N. S. Gotshall. The company has the Colorado agency for the Lozier and Detroit Electric cars, with headquarters at 741 Broadway, Denver.

The Stitt-Dillon Motor Car Co., of Hastings, Neb., has been dissolved, Harry Dil-

lon retiring from the partnership. W. Stitt will continue the business under the style the Stitt Motor Car Co. Dillon has opened a salesroom and garage at 29 South Eleventh street, Lincoln, Neb., where he will handle the Hudson car.

George I. Whitehead, of the Columbia Motor Car Co., and Albert D. Crossley, formerly a foreman for the Pope Mfg. Co., Hartford, Conn., have formed a partnership, under the style The Auto Shop, with headquarters at 4 Crescent street, Hartford. They will make a specialty of rebuilding and repairing commercial vehicles.

In the suit of the Union Motor Car Co., of Chicago, Ill., against the municipality, to restrain the city authorities from ousting the company from its quarters, the garage company obtained an injunction from Judge Cooper in the Superior Court, restraining the city from interfering with the company's garage at 3551 Sheffield avenue. The order of the court is temporary, pending the hearing of the company's suit.

The Joseph Berning Printing Co., of Cincinnati, has applied for a receiver for the Cadillac Automobile Co., of Cincinnati, and has asked that the transfer of the company from Dr. H. C. Wendel to Thomas P. Strack be set aside. The plaintiffs allege that the Cadillac company owes them \$469 for rent and \$75 for advertising and that Wendel claims Strack owes the money, while the latter denies that he has any interest in the business.

Organized with a capital of \$20,000, the Foster Motor Sales Co. has been formed in Detroit, Mich., to take over the agency for Thomas cars. A new building of ornamental glass and metal is in course of construction at 1751 Woodward avenue, and will be ready for occupancy August 1. Until completion of this structure temporary salesrooms have been established at 472 Woodward avenue, with W. H. Foster as general manager and Joseph Chene as superintendent.

Following the cashing of a large check, Ward J. Lee, manager of the Auto Inn at Springfield, Ohio, and former secretary to Mayor Burnett, is among the "missing," and the affairs of the Auto Inn are being straightened out by, Richard Lee and J. S. Elliott. Richard and Ward J. Lee are the real owners of the garage, although it was a corporation, and conducted it as a partnership business. It is said that Lee's debts, amounting to about \$4,000, are fully covered by the tangible assets of the company.

Remy Magneto

**PROVES SUPERIORITY AGAIN IN
HILL CLIMBS AND ROAD RACES**

**Remy-Equipped Oakland Cars Have Won Eight Firsts
and One Second so Far this Season**

In the Algonquin Hill climb, in the annual hill climb of the Maine Automobile Association at Poland Springs, in the Independence Day hill climb at Columbia, S. C., and in the hill climb of the Birmingham, Ala., Motor Club, the Remy-equipped Oakland cars carried off first honors.

Not only on the beach, on track and speedways is the Remy Magneto ignition supreme, but also in road contests and hill climbs. The remarkable performance of the Remy-equipped Oaklands has again shown this conclusively.

Victorious racing drivers heartily endorse the Remy Magneto. They know that Remy construction can be depended on for perfect service under the savage conditions of racing.

Ignition devices are not always under such severe tests, but it stands to reason that a magneto made to meet such exacting demands will perform its task in everyday automobiling with highest efficiency.

Why Not "Stand In" With Owners?

Undoubtedly some of the vigorous applause which greeted the emphatic denunciation of chauffeurs as a class, which was voiced by one of the speakers at the public hearing on the proposed new garage regulations by the Municipal Explosives Commission, of New York, came from the garagemen themselves, and therefore seemed to betoken a wholesome and promising state of mind. It is to be hoped that appearances are not deceiving in this case. For, measured by the New York standard, more wholesome influences are necessary in the garage business if ever the proportions of the so-called "chauffeur evil" are to be materially reduced; and the influences must be exerted by the garage owners themselves.

Denouncing the chauffeur and applauding such denunciations serve no purpose. All chauffeurs are not bad. Many of them are honest, hardworking, self-respecting men;

the honesty and industry of as many more are open to serious doubt, while a third and numerous class is composed of crooks and young men who are on the borderline of crookdom. None is more familiar with the three classes than are the garage owners. They know them intimately and well—far more intimately, in fact, than the men who pay the chauffeurs' wages. But speaking generally it is fair to say that all chauffeurs, good, bad and indifferent, honest and dishonest, look alike to the garagemen. So long as they do not steal from them or misuse their property they seem not to care. The theft or abuse of the property which they are paid to guard and care for appears a secondary consideration.

The chauffeur's mildewed threat, "I'll take my car out of here," is sufficient to bluff the garageman to a standstill, to employ popular terms. The ease with which the words "my car" fall from the chauffeur's lips is about the only humor there is in the situation. If the garageman would but permit the fact to filter through his brain that the cars in his establishment are not the property of the chauffeurs, conditions quickly would become more wholesome.

As it is at present, the average garage appears to be conducted not for the benefit of the owners of the cars but for the benefit of the men who are paid to drive them. What is needed, and needed sadly, is more garages conducted for the benefit of the car owners whose money enables garages to exist. No man who is awed by the chauffeur's threat to remove "his" car or who is afraid or backward in reporting chauffeurs' delinquencies to the chauffeurs' employers can conduct such an establishment.

It is in the power of garagemen to drive most of the grafters and crooks out of the business. They know who they are and they ought to have discernment enough to know that no employer desires to retain in his service any man who is disloyal or dishonest. The garageman knows the joy riders; he knows that, despite the laws making the offense a felony, it is being committed nightly to an astonishing extent and yet he closes his eyes to the commission of this crime and others, when a word from him would help to check and make the victimized car owners his friends for life. The garageman knows the grafters and the gamblers and the foul-mouthed gentry that assist in evolving crooks and in making garages undesirable to the neigh-

bors, but if any garageman of his own free will ever did anything to eliminate such evils his name is not easy to recall. As a matter of fact, not many garagemen know the full names and addresses or license numbers of the chauffeurs with whom they have daily dealings; such records are not considered worth while; indeed, there are garage owners who do not know the names and addresses of even the men whom they themselves employ.

"Get the money by 'standing in' with the chauffeurs," appears to be the rule that governs nine garages out of ten; and as a result, chauffeurs "own" the establishments; too many of which are mere "hang-outs"—mere breeding places for crime. Chauffeurs have become a drug on the market and at the rate at which "schools" are continuing to turn them out, conditions are not likely to become better unless garagemen reform themselves and their ways.

The chief essential is an increase of moral courage—a determination to "run" their own business instead of permitting it to be run by a lot of chauffeurs—a determination to rid their business of crooks and grafters and the adoption of a policy of "standing in" with and protecting their patrons' interests instead of "standing in" with and protecting their patrons' employes at the expense of the patrons. When they do this sort of thing the chauffeurs' threats will lose their sting, and the garageman who goes about it in the right way speedily will discover who it is that really orders a car "taken away" and who it is that discharges chauffeurs when occasion requires.

There already is a law prohibiting the demand for and the payment of commissions to such employes as chauffeurs and fixing a penalty for it, so that garage owners' excuses on that score lack merit; the grounds for refusal of such graft is ample and quickly will check the practice all along the line. And if the garageman does not appreciate that the car owner pays him to guard his property from the numerous joy-riders, instead of closing his eyes to the repeated acts of such criminals, the appreciation may be forced on him in the form of an amendment to the "anti-joy-riding" law making the garageman an accessory to the crime, which, by his complaisance and due to his desire to "stand in" with the chauffeur, he too often makes of himself.

All this is plain language, but the situation merits it. There are some garage own-

ers to whom the strictures do not apply; there are more of them to whom they do apply. For the garage business is one of the sorest spots in the automobile industry, and the deeper it is probed the more noisome becomes the odor.

Meanwhile, the car owner who desires to protect himself and his property and who has not already done so, should "put it up" to the owner of the garage in which his car is stored, by notifying him in writing that no commissions must be paid to his chauffeur and that his car must not be removed from the garage after a stated hour without his, the owner's, specific permission. That procedure will at least hold the garageman for a while and force on him a semblance of reform in spite of himself. It will also cut the ground from under the excuse and defense which he always offers when trouble comes.

The Influence of Equipment.

One of the inevitable and profitable results of the continued tendency to increase the amount of equipment included in the selling price of the car is to improve the nature of the machine. Accessories, sold first separately and later as stock equipment, gradually become amalgamated into the design of the machine until they are inseparably associated with it. Examples in point are the magneto, which now is regarded as much a part of the average chassis as is the carburetter, the engine oiling system, once an independent unit, subject to a considerable retail sale, but now thoroughly merged in the general design of the car, and the lighting system, which yearly is demanding more of the designer's attention and less that of the owner.

In the same way it may be predicted that within the space of one or two years all or nearly all cars of the better class will be equipped with compressed air systems which will be useful for a variety of purposes. For a couple of years past one or two manufacturers have been fitting their products with mechanical air pumps for tire inflation purposes, and with the recent announcements of new products the number has been increased. Similarly the first and second manufacturers regularly to adopt the compressed air engine starter as a standard feature have now been joined by two others. A couple of other makers have now adopted mechanical air pumps for supplying the feeding pressure to the

fuel tanks of their products. Here are three distinct uses for compressed air, each by several reputable manufacturers deemed sufficient in itself to warrant the installation of a small compressor. That the three systems ultimately will be supplied from a single source and at no appreciable expense to the owner is by no means a rash conclusion.

Similarly, there is every reason to suppose that the development of the electric lighting system ultimately will lead to the fairly general adoption of combination lighting and ignition generators as stock features. The further application of electricity to the starting of the motor, rendering it a rival of compressed air, by no means is a new suggestion, nor it is one that has been neglected by the ever active

inventor of accessories. In other similar, though less logical ways, the fitting of the car gradually is being improved, and its convenience and efficiency increased always through the instrumentality of the accessory business.

The consequence is that the accessory maker himself constantly is kept on the alert for new improvements and new additions to car equipment. He is not permitted to rest and wax fat on the fruits of one or two inventive achievements. As a result the market constantly is flooded with new devices, the retail trade is kept from stagnation and always the motorist is offered an increasing array of varied temptations in the guise of improvements, fittings and embellishments. Such are the benefits of fevered competition.

REAL SPORTSMEN REACH LONDON

Prince Henry Tourists Reach Destination—
Anglo-German Contest Notable Event
Free from Trade Influence.

By far the most notable amateur automobile contest ever held, which was also the most notable international contest of the sort—the 1911 Prince Henry Tour—came to a close yesterday, 19th inst., in London,

tween representative Teutons and Englishmen—a good will which, as it was established between more than a hundred high military officers of both nations, may have a far-reaching influence upon the politics of the two powerful European countries.

Rarely has the little town of Homburg, in the Taunus mountains of central Germany, seen such a galaxy of famous persons as were assembled there on July 3 and 4. Emperors, czars and kings have time and again made the pretty health resort their home,

Early in the afternoon of Monday, July 3, Prince Henry and the Prince and Princess of Munster, the dukes of Ratibor and Arenberg, the counts of Arnim and Sierstorf, Sir Arthur Conan Doyle (the creator of Sherlock Holmes), Sir R. Waldie Griffith, Maurice Talbot, the Hon. E. de Grey Beaumont, Lionel de Rothschild, M. P., and many other notables, assembled in the Parkhotel to partake of a splendid champagne supper, which lasted until long after midnight. At this supper the rules of the contest were read to all participants by Contre-Admiral Rampold, secretary-general of the Kaiserlicher Automobil Club. The speaker called particular attention to the rules forbidding speeding of all kinds; to the requirement of keeping the same driver at the wheel throughout the trip (no one else in the car being permitted to touch the steering wheel), and to the necessity of obeying the regulations of towns and cities through which the cars would have to pass. Each driver was to be given thirty minutes' time after the observer had sealed the motor, etc., in which to be on his way; should he require more than this time, he would be fined 1 point. Other penalizations were provided for taking on gasoline or water outside of the control stations and for arrival after a fixed time at each control.

The start was made on Wednesday, July 5, from the Emperor Frederic Boulevard in Homburg, the cars leaving at intervals of one minute each, and Prince Henry himself showing his democratic nature by actually peeling off his coat and filling his

START OF THE PRINCE HENRY TOUR FROM HOMBURG, GERMANY

England, when the 72 participants (40 Germans and 32 Englishmen), drove their cars into the English capital and brought them to a stop in front of the main entrance to the Royal Automobile Club of Great Britain, which had been selected as the finishing point. To-day there will be held in the great banquet room of the club a monster banquet, at which the beautiful ivory trophy, donated by Prince Henry of Prussia, will be handed over to the winning club.

This Prince Henry Tour was the most strictly amateur contest ever inaugurated, not merely because manufacturers absolutely were barred from participation, but because each entrant had to own the car and either drive it himself, or have some other member of the club drive it for him; no professional chauffeur was permitted to take the steering wheel of any of the contesting cars. In order to eliminate even the slightest chance of internal friction among members owning different makes of cars, it had been decided to make no mention of the make of the cars in the official lists, and in the records to be kept of the event; the victorious club was to receive all the glory, with each and every member sharing in it to an equal extent. It was a friendly tilt—a team contest between two nations, and it did a great deal of good in promoting good will and friendship be-

ASSEMBLING FOR THE START OF THE PRINCE HENRY TOUR

but never before were the accommodations of the spa taxed as on these two days. No less than two thousand touring cars rolled into its garages and open places, while the hotels were filled to overflowing with the thousands and tens of thousands of visitors, among whom the English language was heard even more frequently than German.

gasolene tank before starting. With the exception of five limousines, belonging respectively to the Duke of Connaught, Marcus Kappel, W. Ballin Hinde, Edward Rosenberg and E. Moreau, all the competing cars were closed-front touring cars, and it was remarked at the start that automobile body construction had become so standard-

ized that British, French and German cars hardly could be told apart without a careful and minute examination. Practically all the touring cars were painted in light colors, gray and light green being preferred, although there were several white cars in the line-up. Sir Arthur Conan Doyle drove a heavy dark blue landaulet, while the Duke of Connaught had entered a light gray, inside-driven limousine. There was only one American car entered, a Cadillac thirty, driven by a member of the English team.

From Homburg the tour led through one of the most beautiful parts of Germany, made famous in motoring circles by the 1904 Gordon Bennett race, to Koenigstein, then turned north via Leun, Coblenz and Bonn to Cologne, the first night stop. Thence the route led to Munster, the second night stop, and from there in an almost perfect "airline" to Bremerhaven, where all embarked for Southampton on the steamer "Grosser Kurfuerst."

On Sunday morning the steamer arrived at the English port and the rather difficult task of disembarking took place. No serious accidents marred the transfer of the cars from the hold of the ship to dry land, and in less than ten hours all were ready to continue the trip on English soil. The start, however, was postponed until next morning, Monday, 10th, according to schedule, and Winchester, Oxford, Stratford-on-Avon and Leamington were passed in that order. At Leamington the tourists remained over night, continuing the following morning via Leicester, Nottingham, Worksop, Doncaster and Ferrybridge to Harrogate, the famous British inland watering place. Here the competitors remained until Wednesday morning.

Leaving Harrogate, a detour was made through Thirsk, Helmsley and Easingwold into the Yorkshire moors, before proceeding along the main road via Darlington and Neville's Cross to Newcastle-on-Tyne, where another night stop was made. On Thursday morning, July 13, the Scottish border was crossed and the road to Edinburgh lay before them. In the Scottish capital the whole next day, Friday, was spent in sight-seeing and fraternization with officers of the regiments stationed there. The capital of Bonnie Scotland was the most northernmost point reached by the tourists, and when the cars started again they turned their radiators toward the south, going along the west coast to Windermere, where all Saturday night and Sunday were spent in boating and bathing in the lakes that abound in the vicinity.

Due south the tour continued, reaching Shrewsbury on Monday night, then following the banks of the Severn to Gloucester and Cheltenham, where the last night stop was made. On Wednesday morning, July 19, an early start was made for the last leg of the journey, the famous coaching highway from Bath to London, which all participants reached in high spirits and without accident.

FINE RUMPUS FOLLOWS ROAD RACE

**Queer Aftermath of Bakersfield Event—
Trophy Seized by an Official and Herrick, the Winner, Arrested.**

Not all the excitement that attended the Bakersfield (Cal.) road races, held by the Kern County Merchants' Association, on Independence Day, was confined to the course. In fact, most of it did not occur until later in the evening at the Southern Hotel. Then Chairman W. E. Drury, of the local committee, made an effort to recover the \$1,000 Tevis trophy, which had been won by Harvey Herrick, driver of the National car.

The trouble is said to have been due to a confiction in the terms of the donors of the cup and the rules of the American Automobile Association. After the race had been won Referee Percy J. Walker, the A. A. A. representative, and N. R. Solomon, president of the Kern County Merchants' Association, gave Earl Y. Boothe, official representative of the National Motor Car Co., permission to take possession of the cup. Later in the evening the victor and vanquished feasted alike at a banquet given in honor of Herrick. The huge cup was the central figure.

During the progress of the dinner Chairman Drury entered the hotel, and, seeing the cup for the first time, he immediately took possession of it and rushed to his room. There he was stormed by an angry party, composed of Booth, Herrick, Dingley, Reuss and others, who demanded an explanation. Drury claimed he was acting under conditions imposed by donors of the cup, which were that the cup should remain the property of the Merchants' Association of Kern County until won three times. Although this was in contravention to the rules of the A. A. A., as had been explained to him by Referee Walker, he maintained his stand. Herrick, however, finally regained possession by giving a bond for its return on July 1 next, when it is expected another race will be held.

Although victorious in both winning the feature event and securing possession of the cup after considerable difficulty, to cap the climax, Herrick was arrested the following day, charged with technically violating the county laws by running his car over the China grade during hours not permitted by the racing commission. A county ordinance closed the grade to automobiles at all times, but the committee secured permission of the supervisors to allow certain racing cars to run over it from 4 to 6 o'clock in the morning for practice. The course is one of the roughest over which a race ever was run, in addition to being narrow it is precipitous and dangerous from beginning to end. For this reason practice permission was given only during these

hours. Herrick, it was alleged, drove over the course in the afternoon. He claims Chairman Drury gave him permission to go over the course, and he was released upon his own recognizance.

St. Louis Contest Fails to Start.

The reliability contest, which was to have started from St. Louis, Mo., Saturday, July 15, under the auspices of the Missouri Automobile Association, did not start. At the last minute it was postponed because of the small number of entries. The run was to have been made to the Southeastern part of the State, the Arcadia Club trophy being the prize at stake. The scarcity of entries was due to fear that the roads below De Soto had not been sufficiently improved to permit of safe traveling. A month ago they were impossible and impassable, and tourists through that section were compelled to go many miles off the course. Three Cadillac cars, which had been entered by the Bagnell Automobile Co., of St. Louis, made an unofficial start. William F. Bagnell drove the first car, Clifford L. Garrison the second and Dan Griver the third. The others that had been entered concluded to wait until another date was selected by the association.

Indianapolis Racemeet is Abandoned.

The racemeet which was announced to occur on the Indianapolis Motor Speedway on Labor Day has been called off. Although an application for sanction had been made to the American Automobile Association, after due consideration it was withdrawn. This was brought about by requests from the Chicago Motor Club, which already had sanction for the Elgin road races, to be held August 25 and 26, and which considered that the Hoosier event would have been a counter attraction to the national stock chassis races. The policy of the Speedway, it is announced, hereafter will be to hold annually but one big event.

Twenty-four Hours Race Called Off.

The twenty-four hours race, which was to have been run at the Brighton Beach (N. Y.) track August 4-5, has been called off by Manager E. A. Moross, on account of lack of entries. But six cars had been nominated up to July 17, although it had been specified that at least ten entries must be made by that date. This failing, the meet naturally has been abandoned for the present. Moross expects to arrange the event for September 4, after the matinee races to be held at the track are over.

Guttenberg Races Postponed One Week.

The racemeet which was to have been held on July 15, at Guttenberg (N. J.) track, under the auspices of the Guttenberg Motordrome Association, has been postponed to Saturday next, 22d inst. The promoters deemed it advisable to defer the meet in order to obtain more entries.

CLEVELAND CONTEST RUN IN RAIN

Rain Makes Mud and Mud Does Not Make Joyful Going—Nevertheless 33 Try for the Honors.

Thirty-three of the 40 entrants started in the three days' reliability contest promoted by the Cleveland News. Although rain greeted the motorists Monday morning, 17th inst., when they assembled at the Hollenden Hotel in Cleveland, it did not dampen their spirits, nor serve to daunt Mrs. F. C. Wood, the only woman entrant, who drove a seven-passenger Oldsmobile, which carried, besides herself and Mr. Wood, two other men and two women.

The objective point was Wheeling, W. Va., by way of Warren, Youngstown, Canton and New Philadelphia, thence return through Columbus and Zanesville and back to Cleveland, where the contenders arrived last (Wednesday) night, having covered a distance of 533 miles. The cars started at three minute intervals, John Rauch, driving a Krit roadster, leading, followed by Mrs. Wood.

Although rain had been falling all Sunday night and continued until late Monday morning, Youngstown, which marked the first 68 miles, was reached by noon. With the exceptions of a few punctures all the cars went through without trouble. All along the line they were greeted by the farmers and townspeople, who, notwithstanding the bad weather, lined the road.

On account of almost 20 hours of rain the roads were very bad, and travel necessarily slow.

Only 25 of the 33 cars checked in at Zanesville, as the morning run proved the hardest of the trip. The famous St. Clairsville hill, just outside of Wheeling, was the "Waterloo" for many. It is nearly five miles long and recent rains made the road in places almost impassable and played havoc with the schedule.

Some of the contenders remained in New Philadelphia, but most of them pressed on to Wheeling. The return trip was started Tuesday about noon, by which time all the stragglers had reported.

John Rauch, driving a Krit, had 17 punctures during the first day and did not reach Wheeling until four o'clock Tuesday morning. As according to the rules time is allowed for punctures, his score remained unblemished.

Bright sunshine greeted the motorists for the second day, and the trip was made to Columbus and Zanesville without undue mishaps. The roads were in bad condition on account of the rain. Wednesday the final leg of the trip was made from Zanesville to Cleveland.

The starters were as follows: C. H. Tyler, Columbia; C. G. Bleasdale, Maxwell; Dan W. Iseminger, Velie; Harry L. Lance,

Velie; Andy Auble, Oldsmobile; Fred Krum, Oakland; John Rauch, Krit; B. Sampson, Brush; Harry Kortz, Firestone-Columbus; Ira Fouché, Garford; F. B. Smith, Buick; C. D. Paxon, Jackson; L. B. Moore, Regal; G. P. Sperry, Regal; J. H. Greenwald, Marmon; H. W. Orndorf, De Tamble; T. S. Hammer, Peerless; M. Keiser, Bergoll; J. Bauer, Oakland; F. Metzger, Everett; E. B. Flinch, Chalmers; V. R. Hall, Cartecar; F. Krif, Krit; J. Adrian, Lion; J. P. Norwalk, Norwalk; J. T. Ruffel, Norwalk; F. E. Van Patten, Ford; E. C. Lucas, Mitchell; A. G. Bredbeck, Reo; Mrs. F. C. Wood, Oldsmobile; J. W. Robertson, Maxwell; P. H. Brown, Stuyvesant.

A. A. A. Punishes Imprudent Drivers.

Leonard D. Ormsby has been indefinitely suspended and disqualified by the American Automobile Association for incompetent and careless driving on the Brighton Beach (N. Y.) track July 3. He was on the track testing his Simplex before the races and had slowed down while passing the club house. H. Frey, who was testing a Mercer racing car, was behind. Following the rule that requires an overtaking car to pass on the right, Frey let his machine out to the limit. He was almost on top of the Simplex when Ormsby turned into the gate leading out of the circuit. Rather than risk a collision with Ormsby's car Frey veered still closer to the fence. In this move he was successful, as he passed Ormsby's car, but was unable to turn out of danger, and fifty feet further crashed into a fence, tearing down two posts. The car was wrecked, and Frey was buried underneath. He died a few hours later. Ormsby's A. A. A. registration card, No. 278, has been officially revoked.

Otto F. Rost and H. D. Fisher, who were reported by Referee Pardington for incompetent driving at the same meet, also have been disciplined. They have been suspended until January 1, 1912, and their cards, Nos. 695 and 518, respectively, have been revoked.

Los Angeles Offenders are Reinstated.

The backbone of the A. A. A. Contest Board wobbled this week long enough to permit the reinstatement of a batch of the offenders who seven months ago took part in the outlaw meets at Los Angeles promoted by Berna Oldfield which were designed to put the A. A. A. "out of business." The men restored to good standing are: F. H. Bechtel, Harry Buckley, William Carlson, Bert Smith and Chester Lawrence. George H. Clark, who competed under the name "Martin," and who was punished even more severely than Oldfield, asked to have his two years' sentence removed, but his application was denied. J. Alex. Sloan and Leslie Henry, who had a hand in the management of the outlaw meets, also asked that their year's suspension be removed, but no action was taken.

HORSES IN WISCONSIN'S CONTEST

Participate in First Stage and Cause Things to Happen—Four Scores Spoiled Early in Fray.

A scared team of horses for a time threatened to score heavily on the first day's slate of the Wisconsin State Automobile Association's second annual endurance run. Seventeen cars started from Milwaukee Monday morning, 17th inst., on the first leg of the journey to Marinette—a run of 190.3 miles. It was just north of Green Bay that the team entered the contest, taking fright at the National entry and so effectively blocking the way that several of the contesting cars were delayed until a disentanglement could be effected and the wagon to which the horses were hitched backed off the road. Later a kindly technical committee erased such penalties as had been caused by the blockade, thus wiping out the horses' score.

The result of the day's running, therefore, was reduced to three penalties inflicted and one held in abeyance, 13 entrants thus having perfect scores. The latter delinquent was the Auburn, which broke a rear axle in the vicinity of fateful Green Bay and had not arrived when voting ceased for the day. The National, after the episode of the horses, had rear axle trouble and lost 10 points in consequence. Taking on water involved 3 points penalty for the Petrel, in addition to 10 points inflicted for stopping the motor—13 points in all. The Franklin car was assessed 3 points for failure to stop the required three minutes at one of the controls.

August Jonas, at the wheel of a Cadillac, led the procession into Marinette, followed by George P. Hewitt and Emil Hokansen, both of whom drove Buicks. Ideal weather conditions prevailed throughout the day and good roads for a considerable portion of the route. Prolonged dry weather had left its mark in rutty and stony stretches, that made progress difficult in several spots, however, notably between Manitowoc and Two Rivers and between Two Rivers and Green Bay—mud as well as stones and ruts interfering with progress in the latter stretch.

The first stop was at Sheboygan, where the theft of the "trail" by small boys caused several contestants to stray for a few minutes. Manitowoc was the noon control, and the first car arrived in ample season for lunch, namely at six minutes after ten. Manitowoc lunches are prolonged functions, however, and in the end the checking-in time at Marinette had to be set ahead an hour in order to ensure sustenance for all.

The second day's run was to Wausau, 171 miles. The run home to Milwaukee ended last night.

MOTORISTS AND MOTOR CARS THAT HAVE FIGURED IN RECENT HAPPENINGS.

The reception accorded the globe-girdling Hupmobile on its arrival in Manila, P. I., and the band wagon which headed the parade which followed the reception.

C. W. Pool, a civil war veteran, who is driving a Brush runabout from Detroit to his home in Springdale, Ark.

Rev. Father Lynch, of Manilla, Iowa, who uses a Brush to enable him to celebrate mass in two towns each Sunday.

Harry Alexander, who piloted a Ford car to the summit of Ben Nevis, the highest point in Great Britain. The round trip occupied seven days, but only 13½ hours' actual running. A wheelbarrow is the only other vehicle that ever has "scaled the heights."

KNOX OFFERS CONTROL OPTIONS

Choice Afforded of Right or Left Hand or Central Positions—New Motor and Enlarged Equipment.

To the two models, the R and S, which it has been making, the Knox Automobile Co., of Springfield, Mass., now has added a third, which differs from former Knox practice in that it has a so-called long-

stroke engine. The S models regularly will be placed in the center of the footboard. As an option the control group may be installed on the right side, while by a further option the steering column may be mounted either on the right or left sides.

The new model has 126-inch wheel base, as compared with 117 on the R four-cylinder model and 134 on the model S now current, which is constructed in so-called raceabout form. Both the latter and the two styles of long-stroke chassis have Fisk

work which surrounds the flywheel. The propeller shaft alignment is such as to give the universal joints a minimum amount of work under normal chassis lading, while the axle, which is of special design, is of the full floating type and built in such a manner that the entire differential group can be removed without disturbing the outer shell, the spring suspension or other connecting parts.

Semi-elliptical springs are employed in front and three-quarter elliptical scroll-end

FOUR-CYLINDER MODEL R RUNABOUT, PRICE \$3,300

SIX-CYLINDER MODEL S RUNABOUT, PRICE \$4,800

stroke engine. The excess of stroke over bore is not remarkable, as a matter of fact, the stroke-bore ratio being only 1.1 to 1, and the cylinder dimensions of the new engine being 5 x 5½ inches. As contrasted with former products in the same line, however, the new motor is something of an innovation, since the cylinder dimensions formerly favored were 5 x 4¾ inches, bore and stroke, employed on both four and six-cylinder motors. The new model chassis, R-45, as it is designated, is to be built in two styles, one a six-passenger torpedo, the body being interchangeable with

bolted-on tires and demountable rims of the same make as standard equipment, but are offered with Universal rims and clincher tires as an option. The six-cylinder model is equipped with 38 x 5½ inch tires, and the new four-cylinder with 37 x 5 or 36 x 4½ inch, the rims being suitable for either size.

The general style of engine construction, which has been retained after several years of successful service, is that of the removable head with both inlet and exhaust valves mounted side by side in the head and actuated by overhead rocker arms. The cylinders of the two four-cylinder models

members in the rear, the latter being 54 inches long in the six and the new four-cylinder models and 50 inches in the model R. The front springs are 42 inches long on all models, or 2 inches longer than were used previously. Contracting service and expanding emergency brakes are employed, both sets being equalized.

In the matter of equipment, the Bosch magneto is used in connection with a battery and coil system giving a complete double system, including even separate switches. Tops with side curtains, windshields, speedometer and clock combina-

NEW KNOX CLOSED-FRONT LIMOUSINE, PRICE \$4,700

LONG-STROKE MOTOR R-45 TORPEDO, PRICE \$3,700

any of those regularly constructed for the six-cylinder model S, and the other a closed-front limousine.

In general, the construction of all three models remains much the same as that which has characterized the Knox line in the past. One important change has been made in respect to control mechanism, however, in that the emergency brake and gear shifting levers of the new R-45 and

are individually cast, but the six-cylinder motor is constructed with paired cylinder castings.

The three-plate type of clutch, with cork inserts, is retained, as is the unit power plant arrangement and the remarkably compact three-speed gearset. The latter is of the selective order, supported by means of arms extending rearwardly from the engine base supports and forming a stout frame-

tions, gas headlights and Prest-o-Lite tanks, combination oil and electric dash and tail lights, shock absorbers, baggage racks, robe and foot rails and full tool outfits are regularly included with each car. Another equipment item which adds a conspicuous feature to the new models is the spare tire case, which, instead of being mounted on the running board, is carried in the rear between the springs and slung beneath the

trunk rack. The general lines of all bodies are similar and characteristic. All models have high sides, the rumbles of the run-about models being the only exceptions to the rule. In the latter models also an exception is made in the mounting of the gasoline tank back of the driver's seat. In the standard touring and limousine models of the line the fuel is carried under the front seat.

Bordino Fails to Make World's Record.

Despite cabled reports to the effect that the world's one hour record recently had been shattered in England by P. Bordino, who was credited with driving a special Fiat racer 116 miles in one hour, the old record, which stands at 89 and a fraction miles, still is intact. It is held by A. Smith and was made on the Brooklands track in England with a Thames car rated at 59.8 horsepower. The confusion in regard to Bordino's performance grew out of the fact that he drove at the rate of 116 miles an hour, this speed being attained in the mile record trials held by the Yorkshire Automobile Club on the beach between Agar's Gap and Saltsburn-by-the-Sea, on the Yorkshire coast, in England, on July 1st.

How far this comes from being a world's record may be appreciated when it is placed beside Burman's phenomenal speed of 140 miles an hour made on the sands at Daytona, Florida. Though Bordino failed to establish a world's record for the mile, he did succeed in lowering the English record for that distance, his time for the flying mile, which was 31 seconds, beating the best previous record, made at Brooklands in 1909, by three-tenths miles per hour.

The makers of Fiat cars have been noted for their production of particularly high powered cars, but whereas those heretofore produced have been rated at the comparatively nominal horsepower of 200, the car which Bordino drove and which is the property of H. F. Mills, is said to be of no less than 300 horsepower. The cylinders, of which there are four, measure 190 x 250 millimeters, which is equal to 7.48 x 9.842 inches. Some idea of the really tremendous size of this car may be gained from the fact that the top of the bonnet is very close to six feet from the road. The car, however, is built on a rather shorter wheelbase than might be expected.

"Head-on Collisions" Made to Order.

Out in Los Angeles they have been conducting "head-on collisions" between automobiles as spectacular attractions, similar to the "locomotive collisions" that have been in vogue for several years. The Los Angeles "accidents" occurred on the Ascot Park track, a Mitchell and an Oldsmobile "locking horns" in one event and a Haynes and a Rambler in another. In both "accidents" dummy figures were employed to represent passengers.

TRAVELING SHOW IN FOUR STATES

Indiana Manufacturers Adopt Novel Means of Demonstrating Their Products— Twelve Days' Tour.

"Howdy!"

"We are from Indiana."

"Made in the Hoosier State; used everywhere."

"Come to the Manufacturing State for goods."

"We lead the Automobile Industry in this country."

"An Indiana man on an Indiana car won the greatest race ever held—and that in an Indiana city."

These are the sentiments which emblazon the banners which are fluttering in the breezes created by the Four-States Tour, which left Indianapolis on July 12 and which has for its purpose the advertising of the motor cars and motor trucks made in Indiana. Governor Marshall not only started the tourists, but with a numerous escort accompanied them to Eagle Creek bridge. They will return to Indianapolis at the end of 12 days, during which the States of Indiana, Missouri, Illinois and Iowa will have been visited.

The "Four States Tour" bears resemblance to a traveling automobile show and is designed not merely to display the goods produced in Indiana but to impress upon beholders the fact that according to the last census Indiana leads the United States in respect to number of automobile factories, if not in volume of output. It possesses 46 plants. Michigan has 43 and New York 34.

The tourists are traveling leisurely. They are making frequent stops and any one who evinces a disposition to "talk automobiles" is having no trouble in finding men able and willing to discuss them intelligently.

The cars that are being exhibited in this novel manner are the following:

Great Western, entered by the Great Western Mfg. Co.; Philip B. Day, driver.

Cole "thirty," entered by Cole Motor Car Co.; John Jenkins, driver.

Mais Truck, entered by Mais Truck Co.; George Turner and Cleve Jeffries, drivers.

Nyberg, entered by Nyberg Co.; Lee Berg, driver.

Whitesides Truck, entered by Whitesides Commercial Car Co.; V. F. Whitesides, driver.

De Tamble, entered by De Tamble Co.; Milt Alphonto, driver.

Marmon, entered by Nordyke & Marmon Co.; George J. Treadgold, driver.

National "forty," entered by National Motor Vehicle Co.; Howard Wilcox, driver.

Waverley Roadster, entered by Waverley Co.; J. M. Ward, driver.

Maxwell, entered by Maxwell-Briscoe Co.; Jap Clemens, driver.

Continental, entered by Indiana Motor & Mfg. Co.; James Hayden, driver.

Nyberg, entered by Nyberg Co.; John McCurdy, driver.

American "fifty," entered by American Motors Co.; H. Jeffrey Fletcher, driver.

American "thirty," entered by American Motors Co.; Charles Boyden, driver.

Lexington, entered by Lexington Motor Car Co.; A. E. Leiter, driver.

Ideal Truck, entered by Ideal Auto Co.; T. A. Speery, driver.

Lambert, entered by Buckeye Mfg. Co.; "Buster" Kiger, driver.

Zimmerman, entered by Zimmerman Mfg. Co.; Bert Farran, driver.

Premier "six," entered by Premier Motor Mfg. Co.; Walter Weidley, driver.

Continental, entered by Indiana Motor & Mfg. Co.; Paul Curlan, driver.

Maxwell, entered by Maxwell-Briscoe Co.; Howard Van Meter, driver.

Parry, entered by Motor Car Mfg. Co.; Joe Towers, driver.

Parry, entered by Motor Car Mfg. Co.; Leon Champion, driver.

Lexington confetti car, entered by Lexington Motor Car Co.; Fred N. Coates, driver.

National "forty" pilot car, entered by National Motor Vehicle Co.; John Aitken, driver.

Cole "thirty" press car, entered by Henderson Motor Sales Co.; H. G. Richey, driver.

The itinerary of the tour is as follows:

Wednesday, July 12—Night stop, Paris, Ill.

Thursday, July 13—Hour stop, from 9 to 10, at Danville, Ill., on public square. Noon-day stop at Champaign. Night stop, Decatur.

Friday, July 14—Two midday stops, Bloomington, Ill., at 10 o'clock, and Peoria at 2 o'clock. Night stop at Springfield.

Saturday, July 15—No noonday stop. Night and Sunday stop at St. Louis.

Monday, July 17—Noonday stop at Troy, Mo. Lunch served by ladies of Presbyterian Church. Night stop at Quincy.

Tuesday, July 18—Noonday stop at Keokuk, Ia. Night stop at Burlington.

Wednesday, July 19—Noonday stop at Muscatine, Ia. Night stop at Davenport.

Thursday, July 20—Noonday stop at Clinton. Night stop, Dubuque.

Friday, July 21—Noonday stop at Freeport, Ill. Night stop, Rockford.

Saturday, July 22—No noonday stop. Night stop, Chicago.

Sunday, July 23—Start at noon for half-day run through Michigan City. Night stop at South Bend, Ind.

Monday, July 24—Noonday stop at Lafayette.

The officers of the tour are: Frank E. Smith, chairman; P. P. Willis, secretary; A. E. Vinton, chairman entry committee; Fred N. Coates, treasurer.

THOMAS DISCLOSES NEW FEATURES

**Tankage System a Radical Departure; Others Not So Radical, but Interesting—
Six Cylinder Models Only.**

Several novel features have been introduced in the development of the new Thomas line, quite the most striking of

tor Car Co., of Buffalo, N. Y., successor to the E. R. Thomas Motor Co., is a direct derivative of the preceding model M. Indeed, it is termed model M. C., is called a "six-forty," and as but one chassis is contemplated just now, the product will be exclusively a six-cylinder one. The seven-passenger touring and five-passenger phaeton equipments, which will be the standard body listings, are here illustrated and re-

to. The gasoline tank is mounted on the right.

A point in this connection which is noteworthy is that the old-time check-valve has been dispensed with, as in a number of other instances of new car design, pure air pressure for supplying gasoline to the carburettor being obtained by means of a mechanical air-pump which is an integral part of the engine assembly. A hand pump is included in the permanent equipment of the car, but it is used only when the machine has been standing for some time with the motor out of operation. For the oil supply to the engine only a hand pump is used. The reason for this is that the lubricating system is of the automatic pump-over order, the replenishment of the reservoir in the base, therefore, only being necessary occasionally.

In the ordinary course of events, the oil from the base is raised to the feeding points by means of an eccentric pump, which is mounted inside the crank case and is driven by a vertical shaft which takes its motion from spiral gears on the cam shaft. Dams in the case and suitable

NEW THOMAS MC SEVEN-PASSENGER TOURING CAR

which, from a structural point of view, is the adoption of a pair of long cylindrical tanks for gasoline and oil, one of which is mounted inside the frame side member on either side of the chassis. To ensure a proper volume of air for feeding purposes, each tank is provided with a low dome, in principle not unlike the steam dome on a locomotive boiler. The fuel supply also is augmented by a ten-gallon reserve, which is carried in a tank under the front seat and fed to the carburettor by gravity.

This disposition of the tankage serves to utilize the space below the chassis line and at the sides which ordinarily goes to waste, and also leaves the rear of the chassis clear of the trailing and obtrusive tank which

NEW THOMAS CHASSIS SHOWING NOVEL TANK ARRANGEMENT

THOMAS MC FIVE-PASSENGER PHAETON, PRICE \$4,000

commonly is used with pressure systems. The space between the rear springs thus rendered available is used for the suspension of a special compartment for carrying heavy tools.

In general the new product, which has been brought out by the E. R. Thomas Mo-

veal certain characteristics of former Thomas models, together with just a touch of modern lines. A four-passenger surrey and two-passenger runabout also will be built. The top view of the chassis, which also is illustrated, affords a good idea of the disposition of the tanks already referred

overflows to the lower compartment of the case serve to retain the working supply of oil at its proper level. A by-pass from the pump leads to a sight-feed glass on the switchboard and indicates whether the pump is in proper working order and the oil circulating as it should.

For testing purposes two try cocks are mounted in the side of the crank case, the handles of which are brought up to a convenient level at the side of the motor. By opening one or the other the level of the oil in the case can be ascertained without the necessity of reaching under the engine. When the oil falls so low that it ceases to run out of the "safety" cock, only a sufficient supply for 30 to 50 miles further running is left in the base. It is then necessary to open the proper cock and pump air into the oil tank under the chassis, when a fresh supply will be forced into the base, the correct level being reached when oil overflows from the cock marked "full."

Rather a novel feature in addition to the tankage is the arrangement of the switch-board, which is in reality a false dash, mounted on the back side of the dash cowl and disposed within convenient reaching distance of the operator as he sits in his seat. On the right side of the board are located the battery and magneto switches, the air pressure gauge for the gasoline tank, the hand pump for forcing oil from the storage tank to the engine base, the air pressure gauge for the oil tank and the oil sight feed glass. The dash cowls are fitted with ventilators, which may be opened or closed at will.

Another innovation of a minor though not inconspicuous sort is the shrouding of three of the four spokes of the steering wheel for about 3 inches inward from the rim. The effect is to produce a better grip for the hands than ordinarily is secured. The fourth spoke, which is vertical when the car is running straight, is left plain and is reserved for mounting the button for the electric horn.

Summarizing several of the detailed changes that have been made in the chassis: The front spring horns have been raised, all spring shackle bolts have been fitted with compression grease cups, the starting crank bracket has been arranged to hold the crank upright when not in use, the front axle, which is of very heavy section, now is made of nickel steel. Timken roller bearings have been applied to the top of the steering spindles, the new wheel spindles being of unusually large diameter. A straight cross steering rod now is used. A new form of radiator fan has been adopted, together with a spring tension device for retaining the belt tension. The radiator filler cap, like the hub caps, is in the form of a globe, symbolizing the 'round-the-world' exploit of the Thomas car in 1908. The cap is closed and fastened down by means of a special locking device.

The universal joint between the clutch and change gear now is protected by a removable aluminum shield which has the advantage of retaining the grease with which the joint is packed and also of catching any oil which might exude from the front transmission bearing. The pinion shaft of the rear axle is retained in a horizontal position, the effect being to afford the same angularity to both universal joints in the propeller shaft and thus equalize the motion of the driving bevels. A tubular member is employed to take up the torque reaction of the rear axle, its forward end being cushioned on springs in a special form of housing. The springs are supported loosely on the rear axle, so that none of the torsional stresses are imparted to them. The heavy full-floating rear axle is fitted with nickel steel sleeves on which the Timken roller wheel bearings are mounted.

The general specifications of the chassis are: Motor, six-cylinder, T-head cylinders

cast in pairs, $4\frac{1}{4} \times 5\frac{1}{2}$ inch dimensions. Ignition, two independent systems, with two sets of plugs, Bosch magneto, batteries and commutator-distributor with single vibrator coil. Clutch, three-plate type, with brass floating disk fitted with cork inserts. Change gear, three-speed selective. Brakes, mounted on rear axle, 17-inch drums, $2\frac{1}{2}$ inch face, total area 525 square inches. Springs, semi-elliptic in front, set 1 inch back of center to improve steering qualities; rear, three-quarter, elliptic, upper quarter mounted in frame by original clamping means. Wheel base, 134 inches.

Ball and Socket Joint for Fittings.

Embodying the principle of the well-known B. & S. steering rod connections, the Billings & Spencer Co., of Hartford, Conn., has just brought out a miniature

ball and socket joint for use in connecting the adjusting rods of carburetors, ignition apparatus and the like. The connection, which is made only in one size, which is threaded for the $\frac{1}{4}$ -inch A. L. A. M. standard rod, is composed of four essential parts, namely, the case, the two-part socket—one part being backed by spring tension and the other being threaded and pinned in place—and the ball member. The purpose of the spring backing for one side of the socket obviously is to retain proper tension on the joint, automatically take up for wear and so prevent lost motion. The complete joint is listed at 25 cents.

Austria a Market for American Cars.

"While the people here are not familiar with all of the various makes of American cars, yet they have confidence in the Americans as builders of durable machinery, and admire its neatness," writes the American consul at Prague, Austria.

"This is not such a good market as America, but when the French, German, Italian and Belgian manufacturers think the field worth invading, why not the enterprising American manufacturer? There are not so many people financially able to purchase cars, but it is conservative to state the present number of cars (over 600 now registered in the Prague police district) will be doubled within a year. American manufacturers have already lost valuable time. It is conceded that the American car has made more improvement in construction

within the past few years than has the European car.

"If there are articles of merchandise which cannot be sold by the English printed catalog and letter route, these are automobiles and motor boats. The dealers want technical information concerning the construction of cars and drawings illustrating the workings of the motors, their construction, etc. Catalogs are not sufficiently explicit. Terms of sale should also be stated; the usual discounts here are 20 and 10 per cent. off.

"If manufacturers are not willing to send cars on consignment or give satisfactory credit, one dealer has suggested he will have one of the leading Prague banks guarantee the purchase price of three or four cars for exhibit purposes. He further assures me that there will not be any question about the ultimate sales of the cars. Aside from the American cars being able to compete in price with other foreign makes, they would have the further advantage of not being handicapped by any local prejudice, as is the case with some foreign cars.

"The import duty on automobiles is: For those weighing under 880 pounds, \$30.45 for each 220 pounds; from 880 to 3,690 pounds, \$24.36; from 3,690 to 7,040 pounds, \$20.36; and for those weighing over 7,040 pounds, \$12.18 for each 220 pounds."

German Magneto Industry Unsettled.

As a result of overproduction and price cutting the magneto industry of Wurttemberg, Germany, is reported by American Consul Edward Higgins to be in an unsatisfactory condition just now. Although the United States offers the principal export market for the product of the four local concerns, the manufacturers of the Bosch, Mea, Eisemann and Ruthardt, the shipments steadily declined during last year. The total for 1910, as a matter of fact, was only \$1,440,357, as compared with \$2,045,313 in 1909. The establishment of the Bosch factory in this country and the proposed establishment of a branch factory for the production of Mea magnetos is thought to explain the decline.

Saving Tires by Reversing Them.

While many motorists are aware that the rear tires of a car carry a greater weight than the front tires, and are taking care to change their rear tires to the front, when they become worn, thereby considerably prolonging the life of the tires, the United States Tire Co. is pointing out that there are few who realize that a similar change from the right side to the left, and vice-versa, is advantageous. As a rule, the tires on the right side of a car receive harder usage by coming into contact with the curb, and also receive a harder abrasion every time a car is turned out of a rut to pass other vehicles. To prolong the life of tires, it is therefore well to reverse them occasionally, placing the worn side nearest the car.

MORE MODELS IN THE HUDSON LINE

Will Comprise Four Cars, Including a Speedster—New Bodies and Larger Wheels—Price Advanced \$350.

Generically the new Hudson line, which has just been announced, will be the same as its immediate predecessor, in so far as the model 33 is concerned. Specifically it will be considerably different. Even more specifically, while the general construction of the chassis is to be continued without material change, the line as a whole will be

top, windshield and front and rear license hangers—these items previously not having been included in the list price. The regular outfit also includes such details as three oil and two gas lamps, full kit of tools mounted in a metal box on the left running board instead of under the hood, metal body construction with aluminum running and toe boards and heel plate and complete fittings, including coat rail, tonneau foot rail and coco-fiber floor mat.

The racing model is also equipped with a Warner 100-mile an hour speedometer, has magneto ignition only and a special form of storm apron, instead of the top and windshield equipment. Otherwise it is

are driven by a short transverse power shaft located at the front of the motor. Cooling is secured by means of an improved type of reinforced vertical tube radiator; the fan which is formed integrally with the flywheel also serves a useful purpose in inducing a draught of air to pass over the entire external surface of the engine after leaving the cooler passages.

The clutch is of an improved multiple disk pattern, fitted with cork inserts and mounted in an oiltight compartment of the flywheel. Ball and roller bearings are now used in combination in the three-speed selective change gear. The general arrangement of the gearset is the same as was de-

NEW HUDSON 33 FOUR-PASSENGER TORPEDO

HUDSON 33 FIVE-PASSENGER TOURING CAR.

modified by the introduction of new body styles, while an addition to the line is to be the "mile-a-minute" roadster—a two-passenger racing machine of sportive appearance and somewhat modified construction and equipment, as compared with the remainder of the line. Quite the most important feature of the announcement which the Hudson Motor Car Co., Detroit, Mich.,

equipped in the same manner as the other types. Electric lights with storage battery equipment, shock absorbers and—for all except the racing model—speedometers are listed as extras. All front wheels, however, rather suggestively are equipped with a gear for driving the Warner autometer.

As heretofore, the construction of the power plant is of the unit type. It is sup-

veloped at the time the first Hudson cars took the road and is noteworthy by reason of its rigidity; the gearset being mounted in a short stout housing which is supported directly by the two rear arms of the engine base. Alignment between the crank shaft and transmission driving and driven members, therefore, is absolutely assured.

The propeller shaft, which is equipped

THE NEW MILE-A-MINUTE ROADSTER

THE TWO-PASSENGER ROADSTER WITH EQUIPMENT

has just made is that the price will be advanced from \$1,250, which was the listing of the previous model in touring form, to \$1,600. It is further noteworthy that the price is to be uniform for all types, and that it includes a full measure of equipment.

The four styles now listed are the five-passenger touring car, four-passenger torpedo, two-passenger roadster and "mile-a-minute" roadster. The standard equipment includes the Bosch dual ignition system, Prest-O-Lite gas tank or generator, 4-inch tires and demountable rims, mohair

ported at four points on the main frame and is of particularly neat construction. The motor is of the block type, its cylinder dimensions being 4 x 4½ inches, bore and stroke; it is cast in block with the valves placed side by side on the left of the car. The valve stems and springs are contained in a dust-proof housing, all other working parts being similarly enclosed. The engine auxiliaries are mounted with extreme care in order to provide a maximum of efficiency and still insure proper accessibility. To this end the magneto and the water pump

with but one universal joint, is enclosed in a torque tube, which is especially fitted to resist the encroachments of dust; indeed, in developing the new model chassis special pains have been taken at every point to prevent the creeping of grit through the exposed surfaces where shafts issue from the various enclosures of the different parts of the mechanism. The rear axle is of the full-floating type, adjustable as to its bearings and made with extra heavy shafts and bearings. The shafts are supported by a combination of double row ball and Hyatt

heavy duty roller bearings. Double brakes are used on the rear wheels, the drums being 12 inches in diameter and the bands 2 inches wide. The service brake, which is actuated by foot pedal, in the conventional way, is of the external contracting type, while the hand operated emergency brakes are of the expanding order.

The suspension is of the semi-three-quarter-elliptic combination. The front springs are 37 inches and the rear ones 47 inches long; the latter an inch longer than formerly. Both front and rear spring members are 2 inches wide. A special provision for continued efficiency in the service of the springs is the adoption of bushings in the spring eyes. By renewing the bushings the effects of wear in the connections are done away with at slight expense and the risk of breakage and consequent need of renewal of more expensive parts thus avoided.

In addition to the adoption of larger wheels and tires on all models except the racer—which runs on 32-inch wheels—the wheel base has been lengthened an inch. The standard tread is 56 inches, but an option on the 60-inch tread is now granted. The tank capacity of each of the three standard types likewise has been increased, the touring car now being fitted to carry 21½ gallons of gasoline, the torpedo 17½ gallons and the roadster 30 gallons. The racer has the same tank capacity as the roadster. In addition to other general improvements, including in some instances the employment of better materials and more painstaking manufacturing methods, considerable pains have been taken to silence the action of the mechanism. The enclosure of the valve action naturally tends to render the motor extremely quiet running, but attention to the details of such parts, for instance, as the plunger pump in the crank case, which is employed in circulating the lubricant, has served to reduce the sound of the engine to an even less noticeable point than before.

White's "Six" and New Prices.

By way of increasing the scope of its product, the White Co., of Cleveland, O., has added a six-cylinder model, which is to be known as the White 60, by reason of its rated horsepower, and which will be the third gasoline car in the line, the other two being the 30 and 40 models, respectively. All three chassis are of the same general design, which is to say that the new six-cylinder motor is rendered conspicuous by the adoption of a single block casting for the entire cylinder group. The long stroke being retained, it is held that the new car should prove especially economical of fuel. It will be produced with seven-passenger torpedo body equipped with 37 x 5 inch tires, to sell for \$5,000. The 30 model will continue to sell for \$2,250. The 40, however, will be slightly advanced in price, the five-passenger arrangement listing for \$3,300, instead of \$3,000, and the seven-

passenger for \$3,500, instead of \$3,200. A variety of enclosed cars, ranging up to \$6,000 in price, also will be produced. The 20 and 40 horsepower steamers also will be continued.

Whistle that Indicates Overheating.

To prevent internal combustion motors from overheating, through one cause or another, is the aim of a new instrument brought out by the Shore Instrument & Mfg. Co., of New York City, and styled the Sico Overheating Alarm. Fundamentally the device is nothing more nor less than an ordinary pet cock, but embodied in it is a sensitive thermostat which is fitted inside of the conical valve spindle, partially extending into the handle, which

is an integral part thereof. The steel rod, C, is securely fastened to the brass valve spindle at B, while E is the valve seat for the supplementary steel valve and D the whistle.

Normally the handle is set in a vertical position so that the valve may be closed as usual while the motor is running. When, however, the motor heats up beyond a safe running temperature, the brass valve spindle, A, will expand and elongate at a quicker rate than the steel pin, slightly opening the valve, C, and causing the whistle to blow by permitting the hot gases to escape through the by-hole, F, and the valve, C. The plug, G, can be adjusted for giving the overheat alarm at any desired temperature, or for taking up possible wear in the spindle. A turning of the handle, D, over a slight angle will close the by-pass hole, F, and stop the whistling.

Central Motor Markets Larger Taxicab.

Working on the idea that many taxicab enterprises are unprofitable and that the nature of the equipment used has a good deal to do with the difficulties that are experienced, the Central Motor Co., one of the United States Motor Co. subsidiaries, which recently has produced in the Titan a very light machine obtainable either for

taximeter service or parcels delivery, has now turned its attention to a vehicle of more substantial construction. This is the Central taxicab, a machine built to sell for \$1,750, and fitted with special regard to the character of the service intended. Basing depreciation on a three-year life expectation, it is figured that the average proprietor can well afford to "write off" \$50 a month for renewals and still leave himself an attractive margin for profit, which policy the low price quoted is calculated to permit.

Eagle Making a New Windshield.

Frank F. Weston, general sales manager of the Eagle Company, Newark, N. J., started this week on a visit to the automobile factories in the Middle and Central States and will return in about four weeks. The Eagle Company is bringing out a new "rain vision clear vision" windshield, for high priced cars, which will be known as the Eagle shield. The company's Standard Friction windshields will be continued, with 1912 improvements and the addition of a vertical clear vision and a zigzag clear vision model, the "clear vision" feature being that the upper and the lower glass at the edges where they join have no brass framing to interrupt the view. Weston's trip is for the purpose of acquainting the motor car manufacturers along the line with the details of the new offerings that are being made ready.

Data Sheets that Help Engineers.

Taking a cue from the plan of the Society of Automobile Engineers to embody its standard information and data on automobile design in the form a loose-leaf pocket-book, several manufacturers have reduced the essentials of their catalogs to similar form and have prepared standard data sheets for circulation among the members of the society. The United States Tire Co. already has sent out a series of six sheets covering the specifications of Hartford and Morgan & Wright solid tires and rims, the information being complete in every respect. A similar set of five sheets likewise has been issued by the Hyatt Roller Bearing Co.

New Material for Tops and Upholstery.

Among the many manufacturing developments which have been encouraged by the increasing importance of the automobile industry is that of the various special fabrics which are coming into use for upholstery and top covering purposes. A recent addition to the list is Quennard's fabric Crystol-Mohair, a heavy water-proofed material designed especially for tops, which is being marketed by William L. Barrell & Co., of New York City. The material, which has a fine surface and is unusually pliant, is made in a number of colors and designs. It is described as looking exactly like mohair but wearing like leather.

NEW TRUCK WITH A NOVEL ENGINE

Comes from Milwaukee and is a "Big Fellow"—Unusually Slow Speed Motor and Radical Valve Mounting.

After a corporate existence of nearly a year, the Motor Conveyance Co., of Milwaukee, Wis., has announced the details of its six-ton B. O. E. truck, thereby revealing the fact that considerable independent

Chas. F. P. Pullen, cashier of the German American Bank, of Milwaukee, is president of the company; Frank M. Davis, president and majority stockholder of the Davis Manufacturing Co., builders of automobile and marine motors, is secretary and treasurer; I. W. Davis, superintendent of the Davis company, is vice president, and G. B. Louderback, formerly sales manager of the Buckeye Manufacturing Co., has assumed a similar capacity in the new concern.

In the development of its line, which

illustrated, is of $5\frac{1}{4}$ x 8 inches bore and stroke, and develops its rated output at 600 revolutions per minute. Like the remainder of the vehicle, it is of original construction, the work of building it being carried on in the company's own shops.

As the illustrations show, it is of the four-cylinder, four-cycle, vertical type, built with cylinders in pairs and widely separated. Advantage is taken of this unusual feature to mount a transverse auxiliary shaft between the cylinder groups for the

NEW B.O.E 6-TON TRUCK WITH DUMPING BODY—A NEW MILWAUKEE PRODUCT

thought and effort has been embodied in its construction. The initials "B. O. E." symbolize "best on earth," it may be explained, and the Motor Conveyance Co. has been launched with the ambitious intention of making good the implied assertion.

ultimately is to be extended to the production of three-, five-, six-, and ten-ton trucks, a new style of heavy-duty motor has been evolved, which is quite distinctive in its way. The particular model which is installed in the six-ton truck, which is here

purpose of driving the magneto. The most radical feature of the engine, however, is the cylinder design. The exhaust valves are placed in offset pockets on the left side of the vehicle in the conventional manner. The inlet valves are in the heads, but are

VIEWS SHOWING PECULIAR CONSTRUCTION OF THE $5\frac{1}{4}$ x 8 INCH B.O.E ENGINE

inclined at an angle of $52\frac{1}{2}$ degrees and also, instead of being parallel in the same plane, are angularly disposed. The result is that when they are removed the cylinder interiors and piston heads may be readily got at to remove carbon deposit. The rocker mechanism and closing springs of the inlets necessarily are a little out of the ordinary, their construction and arrangement being indicated in the illustrations.

The lubricating system used is a special development for this motor, its special feature being the use of a pressure chamber to equalize the flow through the various feed pipes. A gear pump is employed to deliver oil to the chamber from a five-gallon reservoir, whence it is distributed by internal leads to the bearings. A single lead is taken to a sight feed glass, which indicates the condition of the system to the operator at all times. Double ignition, a standard form of float feed carburetter and thermosiphon cooling, are other features.

The motor is mounted in the fore part of the chassis, but not immediately at the front. The radiator is carried behind the driver's seat, a blower integral with the fly wheel serving to ensure proper air circulation. Such is the arrangement that the engine casing, or hood, comes between the two seats that are arranged for the driver and one passenger, sufficient space to cross in front of the engine being left behind the dash.

The master clutch is of the Hele-Shaw type, and drives a three-speed gearset mounted below the chassis in the usual manner. Final drive is effected by means of double side chains. The normal speed of the vehicle is ten miles an hour, the motor being under governor control at all times. The contracting band service brake is of 14 x 4 inch dimensions, while the emergency brakes, which are of the expanding type and mounted in the rear wheels, are of 20 inches diameter and 5-inch face.

The running gear equipment is particularly heavy. The springs are of semi-elliptic pattern, the gear members being supplemented by a bearing spring to carry the load when the truck is in service. The front springs are 48 x $3\frac{1}{2}$ inches and the rear members 56 x $3\frac{1}{2}$ inches, respectively. The main frame is built of 8 x 3 inch structural steel channel. The front axle is of $4\frac{1}{4}$ x 4 inch section and the rear axle is $3\frac{3}{4}$ x $4\frac{1}{2}$ inches. The wheels are, respectively, 36 and 40 inches diameter, front and rear, both being 6 inches wide and shod with block tires. Equipped with driver's cab, horn, lamps and tools, the truck is built to sell for \$6,000.

"Girl Wanted" Sign that Failed.

The girls of Greeley, Colo., are not given to joy-riding, at least with strangers, as George Horn, of that city, has discovered. Horn is the owner of a large touring car, and a few days ago when he grew lonesome, he attempted unsuccessfully to se-

cure a congenial companion to make a trip with him. Telephoning to the homes of a number of friends, in order to make up a party, and finding them all away from town, he conceived what he considered a novel idea. Having a large sign painted containing the words "Girl Wanted," he hung it on the automobile. Then driving the machine to the busiest corner in town he let it stand with its silent invitation, while he retreated to the shade of a doorway, where he could see and not be seen. Girls young and old, blond and brunette, glanced at the sign from the corners of their eyes, but none stopped or seemed to possess the courage to step into the machine for the proffered ride. After waiting the greater part of the afternoon Horn was compelled to "go it alone."

Three-Wheeler Declared an Automobile.

According to the decision of Judge Walter H. Clark, in the Police Court of Hartford, Conn., the three-wheeled Motorette, manufactured by the C. W. Kelsey Mfg. Co., is an automobile and not a motorcycle. The question arose when Howard W. Nichols, one of the employees of the company, drove a Motorette at night without a tail light. Kelsey, in arguing with Judge Clark, declared that in the automobile law of the State, passed in 1909 and now in force, tail lights are required only for motor vehicles of ten horsepower or more; that the Motorette has but seven horsepower and is therefore exempt. When a fine of \$5 was assessed upon Nichols, Kelsey notified the court of his intention to appeal the case to the Superior Court. Meanwhile the new law passed this summer settles the question by defining a motorcycle as a vehicle having only "two wheels in contact with the ground."

Tourists' Trunks Prey for Thieves.

Touring motorists will do well to see that the automobile trunk is securely attached to their cars. As a rule the trunk rests on a rack in the rear of the car and is fastened by straps, which are very insecure against thefts. Since automobile owners have been locking tire envelopes to the running board or on the rear of the car the petty thief has been to a great extent frustrated. At this season, however, when tourists are numerous, reports reach police headquarters in various cities almost daily concerning the loss of automobile trunks. The thieves generally cut the straps when an automobile is held up at a railroad crossing or when the occupants are dining. Such was the manner that a trunk belonging to Patrick T. Powers, of New York, was lost one Sunday night while going from Atlantic City, N. J., to Jersey City. The trunk was in its proper place at Freehold, N. J., but was missing when the automobile reached the Powers home. At the crossing of the Lackawanna Railroad on the Hackensack Meadows the machine was held up for some minutes, during which time it

is thought the thief cut the straps, which permitted the trunk to fall into the roadway.

New State Law Cuts St. Louis's Income.

Owing to the presence of a "joker" in the Missouri automobile law, which is largely a copy of the New York law, and which will go into effect on the first of next month, the city of St. Louis stands to lose about \$20,000 next year in registration fees. This unwelcome discovery was made by the license collectors when they examined the license provisions of the state law, which limit the fees to be collected by any city within the state of Missouri to the amount charged by the state. According to the new law, the fee for registration of automobiles is from \$2 to \$12, while the city of St. Louis had been collecting a flat rate of \$10 for every car. The number of automobile licenses issued during the past year has been 4,632, which, at \$10 each, brought in a revenue of \$46,320. The new rate will cut this sum almost in half, for it provides that machines of less than 12 horsepower will pay \$2; from 12 to 24 horsepower, \$3; those from 24 to 36 horsepower, \$5; from 36 to 48 horsepower, \$7; from 48 to 60 horsepower, \$8; from 60 to 72 horsepower, \$10; and above 72 horsepower, \$12. Another section of the state law provides for the display of a single license number issued by the state, and this provision eliminates the city license tag entirely, which is another effect not foreseen by the city authorities.

State's Attorney Stops "Just ice Mill."

Charges of a serious nature have been filed against Fred Beiswanger, a justice, at Niles, Ill., and an indictment has been handed down charging him with malfeasance in office. He was well known to Chicago tourists as the "Terror of the Milwaukee road," on account of the high-handed methods used in his court to levy heavy fines on passing automobilists. A number of complaints had been made by his victims to State Attorney Wayman, and the latter started an investigation. During the latter it was brought out that the justice refused to hand over any records of the proceedings in his court in a certain speeding case when a change of venue had been obtained by defendant's counsel, and that this defendant had been arrested on fraudulent charges; there were also similar complaints in several other cases. It was also charged that on several occasions he held court in a saloon, operating what is termed a "justice mill"—arresting passing motorists on trumped up charges, fining them heavily and then forgetting to render a proper account of the fines and proceedings. When court officers established a search for the "justice" he could not be found, although he had been holding court up to a few hours previous to the handing down of the indictments.

MORA'S NEW WAGON WELL COOLED

Its Cooling System a Special Feature and the Reasons Therefor—Other Characteristics of the Newcomer.

Up to this time it has been noticeable that the development of the commercial vehicle as a mechanism distinct from the pleasure car has proceeded more rapidly in the direction of large vehicles than it has in the field of the light delivery wagon. That condition now is rapidly being remedied, however, and the smaller commercial, built especially for commercial purposes, is constantly becoming better known. One

of natural circulation of the water, thus dispensing with a circulating pump and also permitting the motor to be run for considerable periods without danger of overheating. This disposition is made with the ultimate service of the machine distinctly in mind, it being considered essential that a delivery wagon be so constituted that the engine can be run continuously irrespective of the speed of the machine, or even of its movement, in order to obviate the need of frequent cranking and likewise to prevent high temperatures.

The flywheel, being constructed with integral fan blades and mounted at the front of the engine, is the only active member required for the circulation of air through the radiator. Lubrication is effected by a

inclination of the user. When solid tires are used, the specifications call for 36 x 2-inch equipment in front and 36 x 2½ in the rear. For pneumatics, the 34 x 4 size is recommended by the manufacturer, on both front and rear wheels.

The frame, which is of heavy section pressed steel, is 140½ inches long and 34 inches wide. Semi-elliptic spring suspension is employed, the front members being 39 inches and the rear ones 42 inches long. Both front and rear springs are 2 inches wide. Special steel axles of 1½-inch section are employed, the frame and running gear construction being unusually solid for a vehicle of less than one-ton capacity. The wheel base is 94 inches and the tread is of standard dimensions. The regular body equipment is that of the conventional open tray with flared sides. The loading space is 78 x 44 inches. A light stake body having an 84 x 44 inch platform, as shown in the picture, may be had as an option. Solid tires, three oil lamps, a horn and kit of tools are the regular equipment which are offered at the list price, which is \$1,000.

MORA 1,500-POUND POWER WAGON WITH OPEN STAKE BODY

of the more recent additions to the class, and one which obviously employs no details "borrowed" from the light passenger car, is the Mora, which has been developed by the Mora Power Wagon Co., of Cleveland, Ohio.

Embodying the essential useful features of opposed motor in front, left hand drive with center control, heavy framing and low suspension, the machine, which is here illustrated, obviously belongs to the working class of motor vehicles. It is rated at 1,500 pounds carrying capacity, has a 16 horsepower two-cylinder, four-cycle motor which is water cooled, and it is geared for a normal speed of 15 miles an hour when running on high gear. As its name suggests, it has been designed by the originator of the Mora car, which was a not unfamiliar product of an earlier period of the industry.

The motor is of 4½-inch "square" dimensions and of generally standard characteristics. It is placed in a most accessible position in the front of the vehicle, covered by a 15-inch hood and placed directly behind a square-tubed radiator of unusually large capacity. Large jackets surrounding the cylinders and liberal pipe areas permit

combination of splash and force-feed systems. Ignition is carried out by a low-tension magneto and coil.

The transmission unit is concentrated on the countershaft and consists of a planetary change gear embodied in a single housing with the differential. Two forward speeds and a reverse are provided, and they are controlled by means of two pedals and a lever, in the usual manner. The high-speed clutch is of the multiple-disk type, running steel to steel in an oil bath. The change gear unit is fully enclosed. It is mounted on ball bearings at the sides of the differential and on Hyatt roller bearings on the countershaft supports. Final transmission to the wheels is carried on by means of double side chains. The combined radius and distance rods, which are of I-beam section, also serve as brake hangers and anchors. The brakes are of the internal expanding order, mounted on the rear hubs, and are actuated by means of a pedal and emergency lever arrangement, in the conventional manner.

Provision is made for the use of either solid or pneumatic tires, according to the demands of the service in which the individual machine is to be placed, or the in-

Where One Motor Replaced 14 Mules.

From times immemorial the mule has been touted as "the surest-footed quadruped in the service of man"—but in at least one instance it had to give way to the still "surer-footed" motor car. Of course it was not on the mountain roads, where mule hoofs will continue to obtain better holds than any anti-skid tire ever invented, but in the ordinary farm work of James Thompson, of Pendleton, Ore. He recently found that the ground was too slippery for the 14 mules which were furnishing the power for his barley chopper, whereupon he rigged his 28 horsepower Franklin car and dispensed with the mule power entirely. The power of the automobile is applied by means of a frame and jackshaft bearing three wheels. The main axle is lifted from the ground to one end of the frame, and from each rear wheel of the automobile a belt is run to the wheels on each end of the jackshaft. In the center is a smaller wheel from which runs a belt to the machinery which is to be operated.

Long Trip Forced on Big Truck.

Being refused transportation by water and by land, on the steamers of Lake Erie and the railway from Detroit to Cleveland on account of its great size, there was nothing left for a five-ton Sampson truck consigned to the Cleveland Milling Co., but to make the 250 mile run under its own power. It accomplished the task last week without any trouble, reaching the Ohio city on the third day. En route, and to crown the unusual troubles confronting it, when it arrived in Sandusky there was no garage door big enough to admit the truck, which had to be left in the open street in front of a garage over night.

THE GARAGEMAN AND HIS TROUBLES

Many Things that Cause His Profits to Shrink to Small Proportions—Help Problem a Serious One.

"The garage business in New York is becoming worse every year," vouchsafed a man intimately identified with one of those establishments. "What with high rents and expenses, and the various rules and regulations prescribed by the Municipal Explosives Commission, the Fire Department, the fire underwriters and the various other boards that supervise buildings and conditions, there hardly is a good living, much less interest on the investment, for the man who owns a garage, at least one that is located in the automobile district of New York.

"In the first place, the Fire Department orders that certain precautions be taken, and the Board of Fire Underwriters, which limits the amount of insurance that may be carried, directly ignores the instructions of the department and lays down other requirements. For instance, the Fire Department insists that, in addition to fire extinguishers, each floor of a garage shall be provided with a certain number of fire buckets containing water, while the underwriters require a certain number of buckets containing sand to be placed on each floor in addition to the water buckets ordered by the Fire Department. The result is that a garage owner must keep on hand two sets of buckets, the ones containing water being of no use, as it is well known that the surest way to scatter a gasoline fire is to throw water on the blaze.

"Again, the Fire Department permits the delivery of gasoline from a portable tank, containing fifty gallons, but the underwriters say this tank cannot be used unless it is kept outside the building; and they also permit gasoline to be served only from a safety can approved by them. In addition, hardly a month passes but orders are given affecting the electric wiring or requiring that a change be made in the kind of extensions or trail lights that are permissible; and it is a difficult matter to work on the motor of an automobile without an extension light, unless the car is put in the repair shop. Of course, many chauffeurs never put the car in the repair shop, as they understand just what to do to a motor to keep it in good condition, and frequently valves are cleaned or changed between calls, whereas if the car is put into the shop the owner would not be able to use it for a day or two, and also would be charged 75 cents an hour for work his employe could accomplish in a few minutes.

"However, these are only a few of the drawbacks, and if the worry were confined to obeying the various regulations to sat-

isfy each department, the garage manager would be able to get along. Each year, however, manufacturers are enlarging their cars, while the owners are demanding lower storage rates. A few years ago comparatively few cars had a wheelbase of more than 84 or 96 inches, and at that time the owner did not hesitate to pay \$35 to \$40 a month for storage; now few cars are made with a wheelbase of less than 102 inches, and the vast majority range from 110 to 144 inches. These cars take up more floor space in the garage, but the owners object to paying even \$30 a month for storage. This storage charge, it must be understood, means that the car must be washed every night, all the metal work polished and the interior cleaned before the automobile is taken out the next morning. When cars were smaller they had less brass and other metal and the work of keeping them clean was easier. The garage, therefore, made a profit, but with the larger cars and smaller storage charges the garage owner is compelled to retain a greater force in order to have the cars ready for use in the morning, as most of the work is done between sunset and sunrise.

"There is another feature of the garage business of which few automobile owners know anything—the matter of help. Of course, every housekeeper and every business man has trouble in securing the proper kind of help, but all their troubles rolled into one are nothing compared with the difficulties, in this respect, encountered by the garageman. In the first place, as I have said, the important part of the work is done at night; therefore the garageman must have an efficient foreman to look after this branch, for a manager cannot be on duty at all times. But even when a foreman is secured, the length of his stay is uncertain, as a good night foreman is hard to keep, because the other garages are after him. By a good foreman, I mean not only an honest man but one who can accomplish the work at the smallest possible outlay. There are numerous leaks that occur at night, and a number of garages have been closed by the extravagances of the night force. There was a time when the night force would work twelve hours, and work faithfully, but those days have passed, and often extra help must be taken on at midnight if the work is to be finished by next morning.

"The important part of the night work is washing the cars, but not every man who applies for the position of washer understands the work, and nowadays those who are competent will not wash more than ten cars each, when a short time ago they were glad to wash twenty at the same pay. In addition to soap and water, kerosene must be used, as it is not possible to remove grease from the wheels and fenders without it; this is due to the use of oil on the roads. In order properly to clean the average car it must be gone over three times; first with kerosene, then with soap

and water, and finally with clear water, thereby consuming at least an hour. After being washed and chamoised, the car is put in its place on one of the floors and the metal polishers take it in hand. This requires another hour. The interior cleaners spend a half hour or so finishing it up. A garage handling fifty cars a night requires at least four washers, the same number of pushers, six polishers and four interior men, in addition to the day and the night foremen and the day force, which latter should comprise about four men. The day men serve the gas, oil and necessary extras, in addition to keeping the building clean.

"The actual cost of keeping a car, at least to the garage owner located in the automobile district of New York, is about \$22 a month. Few can be kept for less, and this figure does not include the cost of insurance and other incidentals connected with the upkeep of the building in which the car is housed. These expenses must come from the small profit made on gasoline, oil and other accessories that all garages must handle in order to come out anywhere near even. On these the average chauffeur expects and receives a commission, thereby still further reducing the profit.

"These are but a few incidentals connected with the financial end of the business, but the real worry, as I have said before, is with the help, which, as a rule, frequently changes; the manager never can count on his full night force turning up for duty. The washers, as a rule, do not bother about notifying an employer that they will not be on hand, and take a holiday without permission, knowing at the time that they will have to look elsewhere for work.

"As a matter of fact, no one connected with the place is supposed to get a holiday. All days are alike, and a week's work, whether day or night, includes the entire seven days of the calendar week. This is one of the drawbacks, and the pay averages from ten to twenty dollars per week for each employee. Should the garage pay more the management would be obliged to charge more for storage, etc., but those prices cannot be raised. As it is, the average automobile owner wants first class service, but wishes to pay about \$20 a month for it. Frequently one will remark: 'Oh, it is not necessary to wash my car more than once a week, as I do not go out very much and never take it out in bad weather,' which sounds very nice until the car leaves the garage with the slightest imperfection, when the owner promptly complains. However, the owner's story is a different matter; but if anyone has an idea that a garageman's life is a bed of roses, made up of joy-rides and 'easy money,' he should spend a few days or nights in a garage to discover how far wrong people's ideas can go and how much trouble the garage owner runs up against in that short time."

Future of the Truck Business; the Two Avenues Open

Competition is the basis of comparison. Not until the development of modern business methods made it necessary for men to prove their own methods superior to those of others did it become important to contrast the cost of performing the same operation in different ways. Not until there arose an actual competitor for horse haulage in the form of the motor truck did it become useful to know what local transportation, by whatever means, really cost. This is the real reason why the commercial vehicle cost question, which in the mind of the layman probably smacks of uninteresting statistical research, scientific management and other dry-as-dust topics, rapidly is coming to the front.

Haulage cost is the nervous system of the motor truck propaganda; it must be studied and comprehended in all its ramifications if the useful work of the system itself properly is to be carried forward. Unless the nerves are healthy the work of the muscles will be impaired, and the effort of motor haulage demands the sensitive oversight that can result only from the timely and exact information which a thorough knowledge of costs alone can yield.

It is difficult for the man in the street to catch the drift of discussions of the cost question, or to sense the impending change that is hovering over the industry. That it would be useful to know the exact outlay essential to proper automobile operation he is perfectly willing to concede, but it is not so apparent to him that continued study of the cost problem may be destined to result in a wider separation, not merely between commercial and pleasure car methods of production, but in the development of two classes in the field of commercial vehicle manufacture itself.

As nearly as it is possible to define it, the dividing point is the stock car, and the line of demarcation that which divides the maker who builds machines merely to be sold, and thereafter turns his attention to the building of other machines, from the maker who builds machines to perform a definite service and whose interest in his product is retained throughout its useful life. The future of the industry thus may be said, perhaps a little fancifully, to portend an important distinction between two such classes of manufacturer.

One class will manufacture a product for ready sale, figuring on a certain percentage of new customers each year and also on an equally important and ever increasing percentage of resales to old customers—their own or someone else's. As is the case at present, the complete motor vehicle will constitute the unit of production. Such

manufacturers also will recognize as an annoying sort of tag-end to their business the need of supplying customers with parts to replace those that have been worn out or broken in service. Needless to add, this portion of the business will be conducted with ill concealed reluctance, as being unprofitable, generally speaking, complicated, and a point of attack for every dissatisfied customer. Even where parts replacement and even inspection service are undertaken in a business-like way, it will be as a measure of self-protection rather than a remunerative undertaking in the meaning of becoming in any sense a productive occupation.

To draw an extreme and rather striking contrast between manufacturers who conduct their operations along these lines and those of the second class, it may be said that the latter will become essentially producers of automobile parts. Parts production, as the staple of their business, will be carried out with the highest degree of economy possible and with the distinct purpose of securing a reasonable profit on each integer, regardless of the method by which it is marketed. The distribution of such a varied product will be carried out in two ways; first, by the assemblage of parts into complete cars; and second, by the sale of individual parts for purposes of replacement to users of the complete machines. The purchase of one or more trucks, therefore, will not represent the complete sales transaction, but merely will be the initial delivery under an agreement lasting over a period of several years. Even without such an agreement, the principle involved will be much the same, as the commercial vehicle builder of the future will come to reckon on his parts business as a distinct and useful element in his activities—absolutely essential to their furtherance.

Such a contrast, based on the conduct of the automobile business of the day, of course, must appear strikingly radical, if not improbable. That it is the inevitable and logical outcome of the trend of the moment and likewise the objective toward which the latest theories of commercial vehicle practice are converging, a brief consideration will show. It is simply a question of service. If the builder of motor trucks elects to market not only the vehicles, but, in a way, the product of their labor, he must contemplate a fair and open treatment of the replacement problem and also a considerable demand for parts.

Further, he must base his production plans on a careful forecast of the expected demand for replacements on behalf of every

car in use. This implies a close study of depreciation under all sorts of service conditions. Indeed, it is from a review of present ideas on the depreciation question that the vision of the motor truck maker of the future as essentially a wholesale producer of parts as well as an assembler of such parts into complete machines arises. Yet such an outlook is possible only when depreciation is considered in its broadest application, not in the general sense in which it is frequently accepted. Without attempting to lay down an exact definition, which appears to be greatly needed, it is at least not difficult to show the error involved in the common interpretation of the term.

In suggesting that his customers allow 20 per cent. per annum for the decreasing value of their vehicles, the manufacturer at once expresses the conviction that under average conditions the useful life of each and every one of the machines he builds is limited to five years of service. Yet he knows full well that whereas many machines will last even longer in usable shape, others will become practically useless in less time, because of abusive treatment. Five years, therefore, is an average life expectation, but not a representative average.

Similarly, where depreciation is based on mileage alone, although a more just approximation may be obtained, no account is taken of loading, highway or speed conditions under which the machine is operated, and, therefore, even a mileage allowance is an average based on a reckoning of a wide range of good and bad performances. In either case, one class of users will be asked to charge too much to depreciation and another class will be asked to charge too little.

The principle of the thing was explained at some length in a recent issue of the *Motor World*, wherein the views of several well known automobile engineers were discussed by way of indicating the newly aroused interest in motor vehicle costs and the newest thought of the industry on the subject. In substance, the composite idea there expressed was entirely at variance with the common notion of depreciation. It depends on the general hypothesis that the average motor truck, while in service, will be kept in at least fairly good running condition. This means that worn or broken parts will be repaired or replaced as occasion demands and that the actual value of the entire machine as a haulage implement will remain practically constant. Actually it will remain so only so long as it is not permitted to deteriorate through neglect.

But for the sake of argument it is perfectly safe to assume that the prudent operator, at least, will preserve his equipment as nearly as possible in a condition of maximum efficiency so long as it is in use.

On that assumption, the actual deterioration in value of the equipment will be represented by its market worth at any time—still on the basis of its being “kept up.” In other words, its present worth will be represented, not by its second-hand value at

dividually, or as an element of a recognized group or assemblage of parts.

A good set of springs, for example, should last almost indefinitely, barring breakages, but spring shackles and bolts may be expected to require replacement, on account of wear, at the end of a certain period of use. The life of these particular parts, as a matter of fact, is measured by the number of oscillations under load. Actually, legitimate wear bears a certain, more or

need not entail periodic replacement except where the question of noise is a popular issue. In respect to the forks and rods of the shifting mechanism, certain parts should require replacement, while others should not.

Suffice it to indicate that, in general, it is only the parts that are subject to abrasion that should require renewal or adjustment. As to what may be the relative rate of wear of different parts, or what is the

THREE-QUARTER VIEW OF THE SAMPSON FIVE-TON STANDARD OIL TANK WAGON

any given period in its career, but by the investment necessary to replace it. Viewed in this light, depreciation is, therefore, “merely a matter of obsolescence,” which is the attitude taken by W. H. Palmer, Jr., the New York taxicab authority.

A deal of complication is introduced under the general heading of up-keep, when depreciation is dismissed in this summary fashion, however. As far as the bookkeeping end of the cost question is concerned, what happens is that the annual discount of the worth of the equipment is considerably reduced. At the same time, up-keep is made to include a sort of depreciation account for each individual part, either in-

less fixed relation to mileage, depending, of course on highway conditions and also on vehicle speeds. Prompt treatment of the vehicle would entail the replacement of such wearing parts at the end of a predetermined period of use, and before their dimensions had been worn down to the breaking point, or even sufficiently to impair the proper working of the springs.

Similarly the casing of a gearset should last indefinitely, but the bearings of the shafts demand replacement at the expiration of a definite number of revolutions under load. Perhaps the less said about the replacement of gears the better, but at all events the inevitable wear of the teeth

respective influence on that rate of load, road and running conditions, fortunately, it is not now necessary to explain. An admission of ignorance, even, is no disgrace, for, as a matter of fact, no one knows.

The way to the successful handling of the motor truck problem of the future it plain to see, even though some of the details of the method remain to be worked out. Designers must arrange all wearing parts—as they are even now doing with certain ones—so that the worn elements can be replaced with a minimum of labor and expense. The probable life of such fittings must be evolved largely on an empirical basis. Records of truck perform-

Rambler

Motor Cars

Rambler
Sixty-four

THERE is no danger in cranking a Rambler. The Rambler Safety Cranking Device removes possibility of injury to you. Examine the illustration below and you will see how important is this exclusive Rambler feature. The Rambler has many such advantages of safety, comfort and convenience. Big wheels, big tires and long wheel-base make it ride easily. Seven-eighths elliptic springs and shock absorbers protect you from jolts. The steering pillar may be adjusted to suit your comfort. The upholstery is that found in the finest club furniture. The Spare Wheel removes worry about tire trouble and brakes are larger than will ever be needed. The Offset Crank Shaft and Straight Line Drive enable slow driving on high gear in crowded traffic and obviate the necessity of rushing the hard pulls through sand and up grades.

A telephone message to the nearest Rambler representative will bring this car to your door for inspection. The new catalogue is ready. Send for it.

The Thomas B. Jeffery Company

Main Office and Factory, Kenosha, Wisconsin
Branches: Chicago, Boston, New York,
Milwaukee, Cleveland, San Francisco

ance in different parts of the country, and under readily distinguishable conditions, must be kept separate, so that the "expectations" of different sorts of service may not be confused. "Averages" that are not representative must be avoided.

Thus, in the future, instead of figuring on replacing, say, a dozen spring shackle bolts at 50 cents apiece in the life of the truck, possibly a dozen and a half of bushings will be used, each costing somewhere about ten cents at the outside. Instead of rebuilding the gearset periodically, certain of its parts will be replaced, possibly by representatives of the builder, at stated intervals. Wherever wear is liable to occur, suitable renewal sections will be inserted at a fraction of the present cost of replacement.

Hence the operating problem will be simplified to the periodical substitution of certain definite parts—always excepting the question of accidental damage and the results of abuse. The operator profitably can reduce the equipment and skilled labor accounts of his repair department; his loss of vehicle time through repairs will be materially reduced, and the value of truck service will be proportionately increased.

As for the manufacturer, a study of the operating problem will result in definite knowledge in respect to the at present visionary "life expectation," which, it is held, will come to replace the present loose ideas of depreciation. Instead of planning to manufacture parts for a given lot of cars, he will plan at the very outset to manufacture a sufficient number of parts to outlast the probable life of those cars. Standardization of bushings and other replaceable elements, will enable him to make profitable use of die-casting and stamping processes which, except for quantity work, are impossible to undertake in his own shops. Even where portions of his operations are "farmed out," the increased quantity demands resulting from a lumping of original and renewal requirements, will be of assistance in reducing his outlay per piece.

Another point: In treating the manufacturing problem as one the purpose of which is to produce a number of distinct component units, the idea of flexibility in the equipment will be advanced. The producer thus will find it no hardship to prepare to sell trucks with different gear ratios, different engine powers, different spring equipments, different wheel and tire equipments, nor to keep such varied equipments supplied with parts. This, of course, entails the disappearance of the distinct model, perhaps of the stock car, as the term at present is understood; but it does not imply the disappearance of the stock component. By paying more attention to the production of standardized parts and less to the production of distinct models, the manufacturer will be able to turn out a product that is more adaptable and even less expensive to build and to maintain.

"That's all well and good—a very pretty

theory," says the man in the armchair, making motions in the air with his cigarette, "but it'll be a long time coming, believe me."

Perhaps it will. At the same time, what would require years to accomplish in any other line of activity can be mastered by the automobile industry in a very short time, as the very growth of the business is eloquent witness. Already truck builders are beginning to recognize the limitations that are imposed by too much individuality of effort. To progress more rapidly they must pool issues in the study of certain common problems, one of which is the cost problem. Granted only a suitable clearing house for cost information and a standard method of obtaining and classifying records of performance in respect to the life of individual parts, it will not be long before the makers of motor trucks will begin to learn how properly to predetermine the ratio between car production and parts production, and will learn to base their prices on such total production costs plus a standard percentage of profit.

"That's all right," replies the skeptic once more, "but whereas the cars are sold at once, or at least, say, inside of a year, the spare parts must be held in stock anywhere from one to ten years, or whatever vehicle life you may choose to figure on. What you save by making a whole lot of parts at once, you will lose in interest on the investment which they represent. Either that, or you must make up your parts a few at a time, and so lose the advantage of multiple production.

"And another thing, you cannot get the sort of records you need without relying on the individual operator, especially the little fellow with his one or two trucks, to keep close record and turn in true reports at stated intervals. It isn't likely he will care much about doing that. If it is practically impossible to keep him from overloading and overspeeding, as it is, how in the world are you going to get him to give you an accurate account of what is going on every day in his own business, when that information would enable you to tell him he was expecting too much for his money's worth?"

"Love will find a way." Once it is definitely known how many parts of a given description must be made to last a certain lot of trucks through their natural life, the matter of distributing the cost of these parts and of writing off the investment which they represent will become a very ordinary problem in cost accounting. Cost accounting is a highly developed art that can be relied on for the solution of any problems that properly come within its province.

As for holding the operator down to ratings in the handling of his equipment, whether in the matter of loads or speeds, that is really a part of the whole scheme, although it may not at first so appear. The price of replacement parts, for example,

might be made to depend on the assurance that their requirement was that of legitimate use. Any way conditions are viewed, the thoughtful manufacturer is even now seeking to find out exactly what happens to his product after it goes out of his hands—he cannot improve it unless he has that information. The next step is for him to contribute to the standardization of parts and the standardization of the life of such parts in normal service. That is about all there is to it.

Port Elizabeth a Promising Market.

"Automobiles are becoming more popular every day," reports the American consul at Port Elizabeth, South Africa. "There are at present about 30 in the town and as many more in other towns throughout the district. British cars predominate, but there is evidence of a demand for a medium grade American car. All the rubber tires imported separately are from England. For automobiles these have not been imported to any great extent. Carriage tires of solid rubber are imported to a considerable extent. With steamers direct from New York once, twice, and even three times a month, there should be no difficulty in securing a portion of this trade.

"Rubber tires for carriages and automobiles are selling more and more freely in Port Elizabeth itself, but outside the town, owing to the indifferent roads, the demand is small. In Port Elizabeth the roads are kept in excellent condition at all times. Roads here are constructed of macadam surfaced with tar. As the town is very hilly and the residential section is situated in the higher portions, cabs are used to a considerable extent. All these cabs are equipped with solid rubber tires, as are nearly all private carriages, which are very numerous."

Michelin's Table of Tire Pressures.

The necessity of keeping the tires on one's car inflated to the exact pressure frequently has been impressed upon automobile owners by the respective tire companies, but it is not so easy to tell just when the tires are inflated properly. To assist the owner and driver in determining the needs of his own car, when fully loaded with passengers and complete equipment, the Michelin Tire Co., of Milltown, N. J., is sending out one-sheet posters giving the number of pounds its pressure tester should show for different weights of car and different sizes of tires. For cars weighing from 600 to 1,000 pounds, 3-inch tires and a pressure of 50 to 60 pounds are recommended; for cars weighing 800 to 1,600 pounds, 3½-inch tires inflated to 50-70 pounds; for cars weighing 1,300 to 2,200 pounds, 4-inch tires inflated to 60-75 pounds; for cars weighing 1,400 to 2,600 pounds, 4½-inch tires inflated to 60-80 pounds; and for cars weighing from 2,200 to 3,200 pounds, 5-inch tires inflated to 70-80 pounds.

FARMER STATES SEVEN REASONS

Texas Agriculturist Crisply Summarizes the Necessities for Automobiles—Some of His Own Experiences.

While the advantages of the automobile on the farm often have been painted in glowing colors—usually by men who had nothing to do with farming—the real opinion of the tillers of the soil and the benefits the motor car holds for them, never have been better or more crisply summarized than by a Texas farmer, who gives his views in *Farm and Ranch*, as follows:

"I can tell you seven reasons in seven seconds why the automobile is an absolute necessity to the farmer," the Texan writes, "and here they are:

"First—My automobile put me on the scene at critical times when an hour meant profit or loss.

"Second—My automobile is a great factor in establishing good will and co-operation between my renters and me.

"Third—It has made possible the development on my farm of a social center, from which it has resulted that I have secured my pick of farm renters for my land. It has enabled me to go in for scientific agriculture, long sighted methods and prizes which will mean a still higher reputation for my acreage.

"Fourth—Day and night errands and the delivery of products on schedule time have resulted from the possession of a machine.

"Fifth—My family, my renters and I now enjoy the advantages of both city and country life, with very few disadvantages of either.

"Sixth—My automobile has brought about great improvement in our roads, which is an asset to the whole community.

"Seventh—It enables us to care for our sick and wounded safely and promptly with surgeons and physicians when the emergency demands.

"Before I bought my automobile nobody loved a horse better than I did. Since without prejudice I had been kicked and bitten by favorite horses, had gone through runaways and discussed situations with balky animals I was quite sure that nothing could break my attachment for a good driving horse.

"When it came to the automobile I did not have much faith in my experiment. I had made up my mind that it was liable to break down at any time; that all my neighbors would be set against me because their horses would be afraid of the machines; that altogether the outcome could scarcely be pleasant.

"Here's my experience:

"The automobile never complains nor fails to respond, except when abused by reckless driving over rough places, while

it delights in going at high speed where the roads are good.

"Many farmers suppose that the automobile is for the wealthy man, when it is really the friend of the poor man—much cheaper than horses and good vehicles if managed with the same care. I believe that it is a valuable investment, just as is the plow or mower.

"Let me illustrate how automobile owning works: One day I was in Sherman when a 'phone message came that something had gone wrong with the cattle and no one knew what to do. It was up to me to be on the ground immediately. With a horse this would have required at least an hour, and I probably would have had to hire a rig in the city and pay \$5 for it. Instead of that I answered 'Coming,' clapped the receiver up, ran out, cranked the machine, jumped in, and well within half an hour was working with the cattle.

"That one instance was worth a great many dollars, and I could cite twenty like it of quick trips about the farm. That is one reason why I say that in three months last winter my machine earned enough to pay for itself in ways not expected by me when I bought it.

"The average renter sets down his renters in their little shacks on this and that hilltop, sees them once a month, and allows a spirit of misunderstanding, envy, distrust and ignorant farming to 'take' his farm. Although I use the greatest care in choosing my renters, this would have been my fate but for my automobile."

Cressy's Epitaph for Deceased Tires.

Will M. Cressy, author and actor, who is an automobilist also, is possessed of that nimble wit which should go with his vocations. Recently he gave proof of it in suggesting an epitaph for a pair of old tires which he had forwarded to the United States Tire Co. for examination and which proved to be beyond repair. Informed of the fact, he replied:

"In answer to your communication of the 11th, stating that casings taken from my car are N. G. and asking instructions as to what disposition to make of them, I will say: Deposit them with suitable ceremonies in the junk heap, erecting a modest monument over them, inscribed,

"Sacred to the memory of two Hartford tires.

"Born in Hartford in 1909.

"Lived an exhilarating life, reaching from Boston, Mass., to Tie Juana, Mexico, and back to Boston. Total mileage, 8,000 miles.

"Died in Worcester, Mass., on May 7, 1911, from lack of air!

"The two inner tubes, if convalescent, send to me at my hotel."

According to the Tokio police returns there are 131 motor cars in use in the Japanese capital. In Honolulu, which is located on a less populous island in the Pacific, there are more than 700.

WORKING FOR A STATE HIGHWAY

Missouri Motorists Succeed in Interesting Their Governor—Provide Cars for Three Days' "Prospecting" Trip.

Gov. Herbert S. Hadley, of Missouri, and a large party of motorists will leave St. Louis, July 24, for an automobile tour of road inspection. The trip will last three days. This tour is of much importance to the good roads movement, and may lead to the establishment of an official State highway, which the Missouri motorists have been urging. Gov. Hadley always having been a warm advocate of the movement, he appointed a committee of inspection to accompany him, after being assured by the Automobile Club of St. Louis, the Automobile Club of Kansas City and the St. Louis Automobile Manufacturers and Dealers' Association that a sufficient number of automobiles for the party would be furnished.

In addition to the official party, many local motorists will make the trip. The inspection committee has been divided into two sections, one leaving St. Louis and the other Kansas City at the same time and meeting at a central point. The St. Louis division will divide into two sections at St. Petersburg, one going over the Northern route and the other by the Central route. Returning, the first section will come by the Central route and the second section will take in the Southern route. The Kansas City division will cover the Western section of the three routes.

The members of the inspection party will be: Gov. Hadley; Jesse Tolerton, game warden; W. A. Dahlmeyer, J. W. Householder, H. B. Lewis, Norman J. Coleman, W. R. Wilkinson, R. A. Young, A. T. Nelson, E. E. Swink, members of the State Board of Agriculture; Andrew Sheridan, road expert of St. Louis Street Department; Samuel Plant, marshal; George J. Tansey and James Hagerman, Jr., Automobile Club members in charge of the tour, and representatives of the press.

How a Truck Entered a Saloon.

Not being satisfied with its load of beer, a big automobile truck belonging to Jacob Ruppert Brewing Co., New York, one day last week made its way into a saloon at Eighth street and Third avenue, New York City. In order to get inside the big machine literally had to tear away the entire front of the building. After doing this, the bar was pushed across the room and bottles and glasses were scattered around in all directions. Matthew Tierney, who was in charge of the truck, says it got beyond his control. The truck was only slightly damaged, while the damage to the building is placed at \$1,000.

THE S G V CAR

¶ It takes a man who knows a good deal about automobiles to be interested in the S. G. V. car.

¶ There are a few such in almost every town big enough to have a real automobile dealer.

¶ To such dealers the agency of the S. G. V. car is an asset far above what the mere profit on sales would amount to.

¶ It's similar to the standing a jeweler enjoys when it's known his stock includes some extra fine stones.

¶ The S. G. V. car is an extra-fine product for which there is a limited demand—though it has always been in excess of production.

¶ This excess demand we are trying to partly supply by a moderate increase in output.

¶ And we wish to distribute this increase as widely as possible.

¶ Hence we offer to a limited number of agents who have suitable show-rooms and the right kind of patronage a chance to secure a few S. G. V. chassis which are particularly adapted to fall and winter business. Fitted with enclosed bodies they make the De Luxe town car of distinctive dignity, lasting integrity and astonishing performance.

¶ Our first announcement last week has already brought in general inquiry and it is suggested that intending agents make known their requirements without delay.

¶ We will not sell one car more than we have laid down and deliveries will be made according to schedule.

¶ We firmly believe that we are offering the highest class medium powered and the simplest motor car made in the United States. The S. G. V. car has no batteries, coils, vibrators, no levers on the steering wheel, nothing whatever on the dashboard except a small gauge to indicate that the motor is being lubricated. The car has practically no carburetor, because it is absolutely non-adjustable.

¶ The motor is $3\frac{3}{4} \times 4\frac{3}{8}$, rated at 25 H.P. Finished cars are made with 2, 4 or 5 passenger open bodies and 6 passenger Landaulets and Limousines. The open cars list at \$2,500; the closed cars at \$3,500. The chassis is very simple, very strongly built. Cars are fully equipped, except top and curtains. Equipment includes lamps, horn, magneto, tools, tire irons, demountable rims.

¶ Our printed matter shows the construction of the car and views of finished cars. A request by mail will bring an immediate reply.

This is the season to prepare for Fall and Winter business

THE S. G. V. COMPANY, Reading, Penn.

988,635. Engine Starter. John Watson Fitzgerald, Grand Rapids, Mich. Filed Aug. 26, 1910. Serial No. 579,102.

1. In an engine starter, a freely movable valve, moved to open position by pressure of fluid from the engine cylinder, means for preventing the valve from closing while injecting a starting fluid past the same and means for positively closing the valve against said pressure when the engine is running.

988,650. Explosive Engine. Harry E. Norris, Worthington, Ohio. Filed July 26, 1910. Serial No. 573,999.

1. The herein described combination of a cylinder having a water space, a passageway below the water space, inlet and exhaust ports, the inlet port being opposite the inlet of the passageway and the exhaust port being opposite the outlet of said passageway, a hollow main piston provided with an inlet slot and an outlet opening adapted to register with the inlet port and the inlet to the passageway, respectively, and having a baffle plate mounted on the outer face of the top thereof for deflecting the gases as they enter the combustion chamber, means for reciprocating said piston, an auxiliary piston slidably mounted within the main piston, and means for simultaneously reciprocating said auxiliary piston in the opposite direction to that of the main piston.

988,659. Carburetter. Albert Phinney, Chicago, Ill. Filed Oct. 4, 1909. Serial No. 520,974.

1. The combination with a mixing chamber, of a casing fixed thereto and having air inlets in the side walls thereof, a sliding hollow valve within said casing and having an open end adapted to project into said chamber and provided with lateral air ports registering radially with the air inlets of said casing and adapted to open into the mixing chamber, and an inlet tube for the hydrocarbon passing entirely through said sliding valve and having its discharge opening located centrally of the air inlets whereby its discharge may always be over the upper end of said valve into said chamber.

988,729. Power Transmission Mechanism. Edward Samuel Morrow and Charles Milton Simmons, Cestos, Okla. Filed Jan. 19, 1910. Serial No. 538,941.

1. A power transmission mechanism, comprising a driving axle, a stub axle, power-transmitting wheels in driving engagement with each other and mounted on the adjacent ends of the said axles, one of the wheels being slidable on its axle, and a connection between the hub of the sliding wheel and the bearing of the other wheel for moving the said slidable wheel axially on turning the stub axle out of axial alignment with the driving axle.

988,800. Carburetter. James A. McHardy and Charles A. Potter, Providence, R. I., assignors to Allen Fire Department Supply Company, Providence, R. I., a Corporation of Maine. Filed Sept. 10, 1908. Serial No. 452,508.

1. A carburetter comprising a hydrocarbon reservoir, a flue extended therethrough,

a partition extending longitudinally through said flue to form an air passage and a carburetted air passage, means for supplying hydrocarbon vapor to the latter passage, and a single valve controlling both passages simultaneously, said partition being provided with means co-operating with said valve for permitting the flow of air and vapor to vary in a predetermined ratio, said valve having a port communicating with the carburetted air passage when nearly closed.

988,817. Clutch. Charles C. Rich, Mount Vernon, N. Y., assignor to The Hydro-Kinetic Transmission Company, Mount Vernon, N. Y., a Corporation of Maine. Filed July 23, 1910. Serial No. 573,569.

1. A clutch of the character described, comprising, in combination with drive and driven shafts, a rotor connected to the drive shaft, a rotor casing connected to the driven shaft and formed with inlet and outlet ports, and a shell casing enclosing and surrounding the rotor casing and embodying two parts, one of which is adapted to close said ports and the other of which is designed to establish communication between the ports, the shell casing having a longitudinally sliding movement on the driven shaft.

988,840. Spark Plug. Dwight W. Wadsworth, Bangor, Mich. Filed Sept. 28, 1909. Serial No. 519,942.

A spark plug comprising a metal shell, a core of insulating material secured within the metal shell and having a head at its inner end provided in its sides with a series of recesses forming spaced portions, a conductor secured within the insulated core, an electrode connected with said metal shell, and a series of conductor sections supported in the spaced portions of the head at the inner end of the insulated core and having their ends exposed and in close relationship, whereby a plurality of spark gaps are formed.

988,890. Tire Rim. Frank M. Miller and Arthur F. Steyer, Pontiac, Mich. Filed Sept. 14, 1909. Serial No. 517,708.

1. The combination of a wheel felly having a radially disposed slot extending inwardly from one side, a tire carrying rim mounted on the felly and removable laterally therefrom, means for securing the rim and felly together, a radially disposed valve tube connected with the rim and disposed in the slot, an L-shaped member for closing the side and bottom of the slot and having an opening in its bottom through which the valve tube extends and having slots in its vertical portion, a nut on the tube arranged to screw home against the member and serving to retain the member on the tube when the rim is detached from the felly, and fastenings in the felly extending through the said slots of the vertical portion of the members to clamp the latter in place.

988,973. Transmission Mechanism. Samuel C. Carter, Los Angeles, Cal. Filed May 19, 1910. Serial No. 562,316.

1. The combination with a driving shaft of a low-speed bevel pinion and other beveled pinions longitudinally slidable on said shaft and provided with gear faces, means for moving the low-speed gear into position to mesh with gear faces on said disks, a sleeve loosely mounted upon said driven shaft and contacting said disks, means engaging said sleeve and bodily shifting said disks simultaneously, with means for shifting the other pinions into and out of mesh with gear faces on one of said disks.

988,997. Vehicle Tire. John G. Funk, Swissvale, Pa. Filed Sept. 27, 1910. Serial No. 584,042.

1. In a vehicle tire, the combination of an inner rim detachably attachable to the felly, an inclosed shoe provided with an annular opening along its inner periphery, said shoe having a flat outer face with annular radial projections along its lateral edges, an outer rim adapted to be mounted on said flat face and having annular seats for said radial projections, and a tread secured to said outer rim, substantially as described.

989,040. Driving Mechanism. Harry E. Perrault, Detroit, Mich. Filed Nov. 7, 1910. Serial No. 591,005.

1. In a driving mechanism for a two part shaft, the combination of a shell, two independent drums revoluble therein, a clutch ring mounted in each drum, a central driving disk between the drums and connected to said shell, means to revolve said disk, levers to cause the operation of said clutch rings and a pair of connected arms for preventing the operation of said clutch rings.

989,057. Starting Device for Internal Combustion Engines. Welton H. Rozier and Samuel C. Igou, St. Louis, Mo., assignors to Motor Car & Device Company, St. Louis, Mo., a corporation of Missouri. Filed July 10, 1908. Serial No. 442,837.

1. The combination with an internal combustion engine of an electrical generator therefor, gearing for driving said generator in time with said engine, means for permitting a limited movement of said generator relative to said engine and connections independent of the engine adapted to engage with the generator when it is in any position to move said generator to produce an initial spark.

989,132. Annunciator for Explosive Engines. Rodney C. Dewey, Hoytville, Ohio. Filed Apr. 1, 1908. Serial No. 424,527.

1. In a device of the described character an engine having a plurality of explosive chambers, an annunciator which includes for indicating visually the explosions in each of the explosion chambers and means controlled by the explosions in the respective chambers for actuating the appropriate indicator in the annunciator.

989,258. Ball Bearing Mounting. Henry Hess, Philadelphia, Pa. Filed Apr. 24, 1906. Serial No. 313,444.

1. The combination of a rotary shaft, a stationary support, two non-adjustable ball bearings each comprising an inner and an outer bearing ring provided with radially opposite races of curved cross section and means acting upon the support and a bearing member to maintain the shaft in true rotative alinement.

989,307. Carburetter. Charles P. Simmons, New York, N. Y. Filed Nov. 30, 1910. Serial No. 594,830.

1. In a carburetter the combination comprising a housing having an air inlet and a mixture outlet and whose diametrical horizontal cross sectional area is less than all other diametrical areas, a gasoline container pivotally mounted in said housing and having a maximum external cross sectional area substantially co-extensive with the diametrical horizontal cross sectional area of said housing, said container itself constituting a valve and being adapted when rotated to admit a graduated supply of air between its outer surface and the inner surface of said housing and the said

container being provided with one or more orifices extending through the walls of said container, adapted to permit the escape of gasoline from said container and into said housing.

989,312. Yieldable Gearing. Richard H. Voegtli, Sharpsburg, Pa. Filed Sept. 23, 1910. Serial No. 583,377.

A yieldable gearing comprising a supporting shaft, a large gear wheel provided with a plurality of circumferentially disposed openings adjacent to the periphery of said wheel, a spindle carried by said gear wheel and connected to said supporting shaft, a tubular pin loosely mounted upon said spindle, a crank carried by said tubular pin, a spirally wound retractile band spring having one end thereof attached to said tubular pin, a post detachably mounted in one of the openings of said gear wheel and adapted to have the opposite end of the spring attached thereto and means carried by said spindle and normally engaging said tubular pin for limiting the movement of said tubular pin upon said spindle, substantially as described.

989,332. Vehicle Tire. Albert P. Burrus, Prescott, Ark. Filed Sept. 7, 1910. Serial No. 580,847.

A supplemental tire for vehicle wheels having pneumatic tires, comprising a member formed to provide an annular concavity for the reception of the pneumatic tire and into which the tire when inflated will be expanded against the walls of such concavity, the said member having a tread flange surface thereon and formed at one side of the said surface to provide an annular guard flange, spokes extending inwardly toward the hub of the wheel and formed to provide a hub-receiving passage and fastening devices connecting the spokes of the member with the spokes of the wheel.

989,407. Shock Absorbing Device. Luther A. Peckham, Edgewood, R. I. Filed Nov. 6, 1909. Serial No. 526,524.

1. A shock absorber for vehicles comprising a fixed stud, a ratchet wheel sup-

ported by said stud, means for preventing rotation of said wheel on the stud, a friction drum independently and rotatably supported by said stud, an annular space being formed between the ratchet and inner wall of the drum, a pawl in said space and supported by the drum and engaging the ratchet, means for closing said annular space, a friction band surrounding said drum, and connections for causing the friction band to oscillate, whereby the friction drum will be intermittently rotated.

989,408. Shock Absorber. Luther A. Peckham, Edgewood, R. I. Filed Apr. 6, 1910. Serial No. 553,706.

1. A shock absorber comprising a compound lever consisting of three members, two of which are substantially semi-circular and are pivoted together at one end, the other ends being pivotally connected to the

third member at different points of the latter, a non-rotary friction drum inclosed by the said semi-circular members and means carried by one of said semi-circular members for limiting the closing effect of the semi-circular members due to the operations of the third member.

989,426. Mechanism for Transmitting Motion. Harry Beauregard Ross and Robert M. Ross, Denver, Colo., assignors of one-half to H. Byrd Northrop, Denver, Colo. Filed Jan. 26, 1910. Serial No. 540,246.

1. In means of transmitting motion the combination with a driving and a driven shaft, the driving shaft being endwise movable and the driven shaft being movable toward and away from the driving shaft, of a changeable speed gearing connection between the two shafts, comprising concentric gears of varying size, and eccentric gears interposed between the concentric gears, for the purposes set forth.

989,427. Mechanism for Transmitting Motion. Harry Beauregard Ross, Denver, Colo. Filed May 23, 1910. Serial No. 562,819.

1. In means for transmitting motion the combination of a driving shaft, a driven shaft, an interposed countershaft, a constant speed gearing connection between the driving and countershafts and a changeable speed gearing connection between the countershaft and the driven shaft, consisting of a number of eccentric and concentric gears alternately arranged on the countershaft and a concentric gear on the driven shaft, substantially as described.

989,494. Detachable Wheel Rim. Augustus D. Foucart, Muncy, Pa. Filed Dec. 15, 1908. Serial No. 467,629.

1. In a wheel the combination of a fixed rim having exterior interrupted threaded sections, and an exterior rim having a detachable flange adapted for holding an elastic tire and having interiorly threaded sections of less length than the spaces between the threaded sections of the fixed rim, whereby such exterior rim, with elastic tire attached, may be applied and secured to, or detached from, the fixed rim, as shown and described.

989,689. Gearing. Ferdinand H. Berger, Detroit, Mich., assignor to Russel Motor Axle Company, Detroit, Mich., a corporation of Mich. Filed Sept. 16, 1910. Serial No. 582,386.

1. The combination with an axle case of a compensating gearing insertible in and removable from said case as a unit, said removable unit including the housing for the parts.

No. 5.

NEW HEAD FOR STEVENS-DURYEA

**Former President of Allis-Chalmers Co.
Enters the Automobile Industry—I. H.
Page Divides His Duties.**

Walter E. Whiteside, for several years president of the big Allis-Chalmers Co., and previously connected with the Westinghouse company in an official capacity, will become president of the Stevens-Duryea Co., of Chicopee Falls, Mass., on Saturday next. Negotiations to that end already have been consummated, but Mr. Whiteside's formal election will not occur until next Saturday night, when a meeting of the stockholders of the Stevens-Duryea Co. will be held for that purpose, in accordance with the requirements of its Massachusetts charter.

Mr. Whiteside's entry into the automobile industry is wholly through the earnest efforts of I. H. Page, whom he will succeed in the presidency, but who will retain his holdings and interest as well as the office of treasurer of the Stevens-Duryea Co. It is a happy combination of two men, each of whom sought relief from too arduous duties. Mr. Whiteside, who has been a national figure in business circles for many years, laid down the exacting duties of the head of the Allis-Chalmers Co., intending to take a year's rest in Europe, but Mr. Page, whose strength was strained almost to the breaking point by his many interests, "went after" Mr. Whiteside so energetically that he at last capitulated; moved in part by the prospects of a New England farm as well as belief in the character and future of the Stevens-Duryea company.

Mr. Whiteside's business career is a notable one. He organized the lamp department of the great Westinghouse Co. and made it the most profitable department in the company, and as president of the Allis-Chalmers Co., one of the biggest engineering concerns in the world,

his work was on the largest scale. He is accustomed to doing big things in a big way and cannot well fail to make an impression in his new field.

Wood Seeks Authority to Change Name.

The W. A. Wood Automobile Mfg. Co., of Kingston, N. Y., has filed the required legal notice that on July 29th it will apply to the Supreme Court for authority to change its corporate name to Wyckoff, Church & Partridge, Inc., which latter selling firm itself became a corporation some two or three months since. Both concerns have been closely linked, the Wood company having in hand the manufacture of the Guy Vaughn touring car and the American reproduction of the English Commer truck, for which the firm Wyckoff, Church & Partridge had the American representation. When the Wood company is authorized to change its title, the two corporations will become one in name as well as in fact.

Welch and Rainier Become Marquettes.

The Welch Motor Co., of Detroit, is about to be merged with the Marquette Motor Co., of Saginaw, Mich., but as both are properties of the General Motors Co., the consolidation is largely a family affair. The Welch plant in Detroit will be discontinued and henceforth not only the Welch car but the Rainier, which has been produced in the Saginaw factory, will be styled Marquettes, being distinguished only by model numbers or letters.

Claims Harbridge Appropriated Ideas.

Suit for infringement of patent has been instituted in the United States court in Detroit by the Universal Rim Co., of Chicago, against the Detroit Demountable Tire Co. and the Snyder-Harbridge Co., of Detroit. It is alleged that Justus C. Harbridge, one of the founders of the two Detroit concerns, formerly was an employe of the Chicago company, and that he appropriated the latter's ideas and made use of them in the Detroit rim. The complainants ask for both an injunction and damages.

UNITED MANUFACTURERS DISSOLVE

**Far-reaching Co-operative Organization
Comes to an End—Each Member Again
Will Handle Own Sales.**

With the close of the present month the United Manufacturers, of New York, will terminate their existence and the four manufacturers whose productions have been marketed through that co-operative selling organization again will go their separate ways and dispose of their wares according to their individual ideas and through their own sales staffs. For all practical purposes the dissolution already is complete.

The United Manufacturers represented by far the most ambitious form of co-operative salesmanship that has ever been attempted in the automobile industry. The union was formed about two years ago, the parties to it being J. W. Jones, maker of Jones speedometers; the Weed Chain Tire Grip Co., maker of the Weed grips; C. A. Metzger, Inc., maker of soot-proof and other spark plugs; the New York and New Jersey Lubricants Co., maker of oils and greases, and the Connecticut Telephone & Electric Co., maker of the Connecticut ignition devices and shock absorbers. The last named company, however, withdrew from the organization several months since, and both before and since that time rumors have circulated that the co-operative plan was not working so smoothly as had been anticipated. The basis of the organization was the old idea that it is possible for one central sales office and one set of salesmen to market the products of a number of kindred but non-competing manufacturers at little more than the cost of conducting an individual selling system. The idea and the impressions of increased business and far-reaching economies which it suggests never will lose their attractiveness, but the United Manufacturers gave the system a thorough test, and its failure in this instance is not calculated to encourage others

to undertake a similar co-operative movement.

The four companies comprising the United Manufacturers henceforth will prosecute their sales from their respective factories, and most of their salesmen naturally will be drawn from the force which has represented the United Manufacturers. As the officers of the latter were officers of the four parties to the co-operative agreement, they, of course, merely return to their original tasks and with nothing to divide or distract their attention therefrom.

Changes Among Prominent Tradesmen.

F. G. Bigelow has purchased an interest in the Stephenson Motor Co., of Milwaukee, of which he has been elected treasurer.

Joseph Bennett, who previously represented the Alco interests, has been appointed New England representative of the Warren Motor Car Co., of Detroit.

J. O. Thorson has been appointed advertising manager of the Lion Motor Car Co., of Adrian, Mich. Previously he handled the Brush Runabout Co.'s advertising.

D. W. James has been appointed assistant sales manager of the Metzger Motor Car Co., of Detroit. Formerly he was connected with the Carl H. Page Co., in New York.

F. C. Mock, at one time assistant engineer for the Royal Tourist company, has joined the Thomas B. Jeffery Co., of Kenosha, Wis. He will be attached to the Rambler engineering staff.

Bert A. Becker, who became manager of the Elmore Manufacturing Co., of Clyde, Ohio, when it was taken over by the General Motor Co., has resigned that office. The Elmore property was owned and built up by the Becker family.

Joseph Wolf, formerly with the Post & Lester Co., has become a traveling sales representative of the Eagle Co., Newark, N. J., in the wind shield department. His territory includes New England, New York, Pennsylvania, Delaware, Maryland and the District of Columbia.

Ray Harroun, who earned his greatest fame as the driver of the Marmon Wasp, has been added to the engineering staff of the Nordyke & Marmon Co., of Indianapolis. Although best known as a racing driver, Harroun is a skilled engineer and has invented several automobile devices.

Two New Men in United States Tanks.

George B. and Richard A. Bullock have purchased the Behen holdings in the United States Pump and Tank Co., of St. Louis, Mo., and a semi-reorganization has occurred, although H. D. Murdock remains secretary and manager of the company. A new plant is to be secured and the manufacture of garage tanks and self-measuring pumps engaged in on a large scale.

CAMPBELL ON SHOW CONDITIONS

President of A. M. A. A. Expresses Pointed Views—Too Many Shows and All Held Too Late to be Useful.

Asked his opinion of the show situation, Col. Theodore A. Campbell, president of the Imperial Automobile Co., of Jackson, Mich., was remarkably outspoken and to the point; and what he said is more than usually significant in view of the fact that he is president of the Automobile Manufacturers Association of America, which is booked to hold its first show in Grand Central Palace, New York, during the first week of January.

"In the first place, all shows are held too late," said Col. Campbell. "The dealer must have his line picked out and lined up before the first of January. The manufacturer must know before that what he is going to build and have his samples out.

"Our suggestions would be to hold the shows in September and October, at which times all dealers are looking for their lines for the following year and the manufacturer is looking pretty hard at that time for the dealer. Sales are practically made and contracts closed so far as the dealer is concerned in January.

"I would also suggest holding only about two shows in the United States each year. There are too many shows. It costs too much money, takes too much of your valuable time and does not avail very much."

Detroiters Buy Virginia Top Fastener.

Having been purchased by Detroit men, the Ross-Heaton Mfg. Co., of Richmond, Va., has been removed bodily to the Michigan city, where it has been reorganized under the title the Detroit Auto Top Fastener Co., a patented top fastener, as the name indicates, being the cause of its existence. The new company, which is capitalized at \$50,000, has leased a part of a factory building at Beaubein and Fort streets in Detroit, in which the machinery now is being installed. The officers of the company are: President, C. J. O'Hara; vice-president, Charles S. Tolsma; treasurer, C. B. Whitman; secretary, Wade Millis; directors, H. N. Dunbar, F. E. Tallmadge, H. N. Backus, W. H. Beamer, W. M. Lewyn, A. W. Ehrman.

Accessory Thieves Jailed in St. Louis.

Following a series of thefts of money, tires and various other articles from the shop of the Western Automobile Supply Co., 4701 Washington avenue, St. Louis, Mo., Louis Lennon, a clerk in the place, was arrested and charged with grand larceny. It is said that he has confessed to some of the thefts, and his confession implicated David Grossman, a dealer, with a

place of business at 4363 Finney avenue. A tire, valued at \$60, was traced to a shop at 1900 Pine street, and it was found that Grossman had brought it there, having bought it at a low price from Lennon. Both Lennon and Grossman are in jail awaiting action by the Grand Jury.

Morgan Company to Be Reorganized.

Pending recapitulation and reorganization, the R. L. Morgan Co., of Worcester, Mass., has suspended operations. The company, which was one of the first motor truck builders in this country, long devoted itself to the development of a five-ton vehicle, for which the demand was slow and limited, but last year some new men and new money entered into its affairs, and the production of 1½-ton and three-ton trucks was taken up. They were slow in coming through, and their evolution used up the added capital and brought about the present temporary suspension. The heaviest stockholders, who are New York men, have decided to advance the necessary capital and issue first preferred stock to cover the amount, which, however, has not yet been satisfactorily totaled.

Ball Bearing Company Shuts up Shop.

The B-L Co., which some six months ago commenced the manufacture of ball bearings in Norwich, Conn., closed its doors one day last week for an indefinite period. The future of the company, of which Otto E. Bruenauer is president, will be decided when the directors are called together. The plant was a small one, employing only 25 men, but is said to have enjoyed a good business; its resources, however, are said to have been exhausted.

Ohio Factory Stops Before it Begins.

The Howard Motor Car Co., which aroused high hopes in Galion, O., has dashed them to earth. The stockholders, who once expected to become coupon-clippers and to hear the hum of industry, have decided that the prospects do not justify further investment, and accordingly the plant will be disposed of. It had not yet commenced to produce cars.

Guthrie Now Standard Welding Manager.

P. W. Guthrie has been appointed general manager of the Standard Welding Co., of Cleveland, to fill the vacancy caused by the death of W. S. Gorton. Mr. Guthrie previously was identified with the Republic Iron and Steel Co., of Pittsburg, which is equivalent to saying that he is well versed in the metal industries.

St. Louis Votes for an Outdoor Show.

The St. Louis Automobile Manufacturers and Dealers Association definitely has decided to conduct the open air show which has been under discussion for some time. It has selected the week of the Veiled Prophet parade, October 2 to 7.

SAYS ADAMS'S IS PAPER PATENT

In Suit Involving Midgley Tread, Hartford Rubber Works Makes Vigorous Reply
—Priority Also is Alleged.

Final argument in the suit of the Metallic Rubber Tire Co., of Jersey City, N. J., against the Hartford Rubber Works Co., of Hartford, Conn., which involves the Midgley wire tread used by the Hartford company, was heard by Judge Platt in the United States Circuit Court in Hartford on Thursday last, 20th inst.

The complainant's suit alleges that the Midgley non-skid tread is an infringement of its patent, No. 609,320, issued August 16, 1898, to Dr. Calvin Thayer Adams, of New York. Through its counsel, Ernest Hopkinson, the Hartford company attacked the validity of the Adams patent, citing as a prior invention a British patent issued to one Phillips, in 1893, and pointing out that the Hartford tire employing the Midgley tread is manufactured under license from Thomas Midgley, whose application for the patent was filed September 11, 1896, two years before the Adams patent was issued.

It also was contended that the patent issued to Adams was not issued in accordance with law; that it is not useful and is merely a "paper patent," which, without regard to the question of anticipation of prior patents, discloses an impracticable device, as concerns any commercial value. The Hartford Rubber Works Co. further alleged that there was no evidence before the court to show that any tires had ever been manufactured, or attempted to be manufactured by the Metallic Rubber Tire Co., or any license issued under the Adams patent.

The court took the case under advisement.

Gets Lower Duty on Magneto Parts.

The Board of United States General Appraisers last week sustained the protest of the Packard Motor Car Co. against an assessment on imported magneto coils and condensers which had been levied by the Collector of Customs at the port of Detroit.

The goods in question were taxed under paragraph 141 of the tariff act, as "finished parts of automobiles." The Packard Company claimed the merchandise dutiable at 20 per cent. ad valorem under paragraph 480, as "non-enumerated manufactured articles," and at 10 cents per pound and 20 per cent. ad valorem under paragraph 91, as "manufactures of which mica is the component material of chief value."

General Appraiser Fischer, who wrote the decision of the board, says in his opinion:

"It appears from the record that the windings and condensers are of the same character as the articles passed on by the board in abstract 24,259 (T. D. 31,070). The coils

are in chief value of covered copper wire and are dutiable as 'wire articles' under paragraph 135. That claim is not raised by the protest, and as to such goods the protest must be overruled. The condensers are in chief value of mica, and as to such merchandise the claim in the protest under paragraph 91 is sustained. Reliquidation will accordingly follow."

Lower Rate to Canada Now Assured.

Automobiles are among the parts that will be benefited by the Canadian reciprocity bill, which was passed by Congress on Saturday last, 22d inst., after four months of hauling and counter-hauling. After the act is ratified by the Canadian Parliament and is proclaimed by President Taft, "motor vehicles, other than for railways and tramways and motor vehicles and parts thereof, not including rubber tires"—to quote the exact language of the bill—which are shipped into the Dominion will bear a duty of 30 per cent. instead of 35 per cent. as at present, a reduction equivalent to 14.3 per cent. On the other hand, if ever Canada ships such products into this country, the duty thereon will be 30 per cent. instead of 45 per cent. At present Canada is by far the largest purchaser of American automobiles, while the Canadian car on this side of the border is a rarity.

Will Manufacture Releasing Tire Valve.

For the purpose of manufacturing a patented tire valve which releases or "blows off" when the desired pressure is obtained, the Ohio Auto Accessory Co. has been organized in Columbus and incorporated with \$30,000 capital, under the laws of Ohio. A plant has been leased on North High street. The officers of the company are E. J. Harth, of Cincinnati, president; Nathan Meyer, of Columbus, vice-president; William Bott, treasurer; A. E. Shotford, secretary; W. C. Wentworth, who is the inventor of the valve, general manager.

Cole to Erect Four Story Addition.

In addition to purchasing the factory on East Washington street which it occupies, the Cole Motor Car Co., of Indianapolis, last week bought the adjoining real estate, on which it immediately will erect a four story concrete building, 100 x 190 feet, at a cost in excess of \$50,000. When completed, part of the new structure will be used for the body work of the Cole cars, which now is performed in detached but nearby buildings, the entire plant thus being brought under one roof.

Rudd Purchases Detroit Top Plant.

W. H. Rudd, a resident of Detroit, who conducts an automobile top plant in Walkersville, Ont., has purchased the assets of the embarrassed United States Auto Top Co., of Detroit, and will continue the business at 961 Beaubien street. It will be operated, however, under the style of the Rudd Auto Top Co.

McCUE AND SUPERIOR AMALGAMATE

Hartford and Buffalo Axle Manufacturers Merge Under Former's Name—McCue is Made President.

What was the Superior Axle & Forge Co., of Buffalo, N. Y., now is the McCue Co., and C. T. McCue is its president and general manager.

The proceeding represents a consolidation of the Superior company and the McCue Co., of Hartford, Conn., which has been in process of negotiation for several months. It was consummated late last week when the new McCue Co. was incorporated under the laws of New York with \$700,000 capital, of which \$650,000 has been paid in.

The incorporators are C. T. McCue, of Hartford, and J. W. Lansing, B. H. Bean, Ira T. Gleason and H. A. Kamman, of Buffalo. Following the incorporation, Mr. McCue was elected president and general manager of the company, Mr. Lansing, vice-president and treasurer, Mr. Bean secretary and H. T. Doll, assistant secretary-treasurer.

The McCue Co., of Hartford, was organized under the laws of Connecticut in December, 1904, and has made a name for itself as a producer of axles, indeed it has had more business than it conveniently could handle. The Superior Axle & Forge Co., on the other hand, was formed only last year, and began operations in January last in a big and distinctively modern plant in Buffalo, located opposite the Pierce-Arrow factory. As it was able to take care of more business than had come its way, the conditions existing facilitated the consolidation of the two companies, and as both plants will be continued, Mr. McCue will be able to handle all—and more—of the Western orders that were within his reach but which the overtaxed facilities of his Hartford property obliged him to turn away or to remain out of the bidding. He himself will hereafter make his headquarters in Buffalo.

In addition to the I-beam and finished axles and the steering arms and knuckles produced by the original McCue Co., the new concern will go heavily into the manufacture of drop forgings, the Buffalo plant including in its equipment drop and steam hammers of from 1,500 to 10,000 pounds capacity.

Mitchell-Lewis Forms London Company.

The Mitchell-Lewis Motor Co. has incorporated its British branch under the style the Mitchell-Lewis Motor Co. of London, Ltd., with an authorized capital of £1,000 in £1 shares. H. Plow and C. R. Andrews are named as the first directors. Plow only recently went from the Mitchell factory to take charge in London.

Seattle, Wash.—Automobile Exchange changes name to Motor Sales Co.

Detroit, Mich.—Hunter Auto Lock Co., under Michigan laws, with \$25,000 capital. Corporators—John W. Hubbard, F. C. Steck, Thomas Ahearn.

Seattle, Wash.—Washington Auto Tire Filler Co., under Washington laws, with \$50,000 capital. Corporators—W. G. Swallow, F. R. Pendleton, B. H. Loseless.

New Orleans, La.—Kreher Auto Co., under Louisiana laws, with \$10,000 capital; to deal in motor vehicles. Corporators—Charles, Bertha and Charles W. Kreher.

Des Moines, Ia.—Moyer Automobile Co., under Iowa laws, with \$5,000 capital; to deal in automobiles and other motor vehicles. Corporators—W. E. and E. B. Moyer.

Boston, Mass.—Motor Car Co., under Massachusetts laws, with \$25,000 capital; to deal in automobiles, and other vehicles. Corporators—W. H. Vinal, of Brookline; S. S. Anderson, of Boston.

Augusta, Me.—The Bernstein Spring Wheel Co., under Maine laws, with \$2,000,000 capital; to manufacture, sell, buy and deal in wheels for automobiles. Corporators—E. M. Leavitt and others.

Cambridge, Mass.—Collier Automobile Goggle Co., under Massachusetts laws, with \$100,000 capital; to manufacture automobile goggles. Corporators—G. B. Collier, Cambridge; W. E. Furniss, Somerville.

Camden, N. J.—Shanklin Pneumatic Wheel Co., under New Jersey laws, with \$250,000 capital; to manufacture wheels for vehicles. Corporators—F. R. Hansel, W. F. Eidell, J. A. McPeak, all of Camden.

Kansas City, Mo.—Sweeney Automobile School Co. of Kansas City, under Missouri laws, with \$5,000 capital; to operate an automobile school. Corporators—E. J. Sweeney, Sam Sebree, Ralph S. Page.

Chicago, Ill.—Auto Light & Mfg. Co., under Illinois laws, with \$5,000 capital; to manufacture and deal in automobile lights and sundries. Corporators—Frank L. Winslow, E. J. Lutwyche, W. L. Puffer.

Chicago, Ill.—Automatic Appliance Co., under Illinois laws, with \$5,000 capital; to manufacture and deal in automobiles, motorcycles, bicycles, etc. Corporators—Stephen Velie, Samuel Breakstone, Sarah Procktor.

Norwich, N. Y.—Navoe Auto Co., under New York laws, with \$500,000 capital; to promote and deal in patents, business enterprises, factories, etc. Corporators—L. M. Foster, J. H. White, H. A. Clark, all of Norwich.

Wilmington, Del.—Belt Cushion Tire Co.,

under Delaware laws, with \$1,800,000 capital; to manufacture tires for automobiles and other vehicles. Corporators—W. N. Akers, M. C. Taylor, W. J. Maloney, all of Wilmington.

Terre Haute, Ind.—The Railway & Automobile Grease Cup Co., under Indiana laws, with \$75,000 capital; to manufacture and sell automatic dust-proof grease cups. Corporators—G. J. Thomson, R. R. Armstrong, D. L. Brown.

Camden, N. J.—City Electric Omnibus Co., under New Jersey laws, with \$500,000 capital; to manufacture electric passenger buses and other vehicles. Corporators—F. R. Hansell, J. A. McPeak, I. C. Clow, all of Camden, N. J.

Cleveland, Ohio—Parsch Auto Livery Co., under Ohio laws, with \$1,000 capital; to operate an automobile livery service. Corporators—J. A. Burke, Charles A. Aaron, Wm. M. Byrnes, R. M. Schro, Charles A. Burke.

Detroit, Mich.—Reliance Auto Express Co., under Michigan laws, with \$15,000 capital; to deal in and rent automobiles and motor vehicles. Corporators—Chase Soule and Chase Soule, of St. Albans, Vt., and Elmer F. Soule, of Detroit.

New York, N. Y.—Auto Lighting Exchange Co., under New York laws, with \$100,000 capital; to manufacture and deal in storage batteries and lighting supplies. Corporators—W. H. Heim, A. F. Johnson, T. F. Axtell, all of New York City.

Philadelphia, Pa.—The Philadelphia Motor Co., under Delaware laws, with \$100,000 capital; to manufacture and deal in automobiles, motors, gas engines, etc. Corporators—J. F. Green, Philadelphia, Pa.; J. L. Wolcott, H. R. Martindale, Dover, Del.

San Antonio, Texas—The San Antonio Wheel Co., under Texas laws, with \$500,000 capital; to manufacture automobile wheels exclusively. Corporators—J. O. Howard, of San Antonio, president; E. L. Farnsworth, of Waco, secretary; and others.

New York City, N. Y.—Eureka Safety Crank Co., under New York laws, with \$50,000 capital; to manufacture safety cranks for motors and engines. Corporators—L. Bartlett, of Englewood, N. J.; G. W. Peck, New York; S. L. Bevan, Orangeburg, N. J.

North Tonawanda, N. Y.—The Front Drive Motor Co., under New York laws, with \$50,000 capital; to manufacture motor trucks, engines, machinery, electrical appliances, etc. Corporators—W. Christie, F. J. Adler, W. A. Fleming, all of New York City.

Pocahontas, Va.—Southwest Virginia

Motor Co., Incorp., under Virginia laws, with \$10,000 capital; to deal in motor vehicles, accessories and maintain a garage. Corporators—W. L. Mustard, W. H. Walters, J. Walter Garybeal, James H. McNeer.

Buffalo, N. Y.—The McCue Co., under New York laws, with \$700,000 capital; to manufacture electric, gasoline and steam vehicles. Corporators—J. W. Lansing, I. T. Gleason, B. H. Bean, H. A. Kamman, of Buffalo; C. T. McCue, of Hartford, Conn.

Des Moines, Ia.—Iowa Auto Tire Filler Co., under Iowa laws, with \$100,000 capital; to fill tires for automobiles and motor cars. Corporators—Thomas W. McNear, Thomas W. McNear, Jr., W. C. Nelson, E. Warren Doolittle, William A. Graham, all of Des Moines.

New Orleans, La.—Pelican Garage & Automobile School, Limited, under Louisiana laws, with \$25,000 capital; to operate a school of automobile instruction, and to buy, sell and deal in automobiles and supplies. Corporators—Albert Coquenheim, James R. Stewart, William F. Denny.

Louisville, Ky.—Oldsmobile Co. of Kentucky, under Kentucky laws, with \$10,000 capital; to manufacture, buy and sell all kinds of motor vehicles, including aeroplanes. Incorporators—T. F. Smith, of Louisville, three shares; R. N. Mosher, of Lansing, Mich., three shares; W. J. Mead, of Lansing, 94 shares.

Increases of Capital.

Waukesha, Wis.—Waukesha Motor Co., from \$100,000 to \$200,000.

Detroit, Mich.—Wolverine Auto Supply Co., from \$2,500 to \$10,000.

Recent Losses by Fire.

Hazleton, Pa.—Alvin Markle's garage and three cars burned. Loss, \$25,000.

Jenkintown, Pa.—Isaac Silverman's garage and stable destroyed. Total loss, \$50,000.

Chicago, Ill.—The Hub Garage, 24-28 West 19th street, and six automobiles destroyed. Loss heavy.

Bad Axe, Mich.—Buick Garage, George Kerr, owner, destroyed and nine cars burned. Loss, \$20,000.

Philadelphia, Pa.—Locomobile Co.'s garage, 245 North Broad street, burned; contents saved. Loss, \$1,000.

Minneapolis, Minn.—Standard Automobile Co., 1204 Hennepin avenue; garage and four cars burned. Loss, \$7,500.

Roy Gibbons has opened a garage and machine shop on Main street, Elroy, Wis.

Elmer Bleick and A. F. Schroger have purchased the business of the Walter Auto Co., of Appleton, Wis.

Frank Lowater has opened salesrooms at Chippewa Falls, Wis. He handles Parry cars and Metz runabouts.

W. W. Keefer has broken ground for a garage at 4302 Grant boulevard, Pittsburg, Pa. It will be of brick and will cost \$2,000.

Edward Cronin is building a garage on Maxfield street, New Bedford, Mass. It will be one story high, of cement blocks.

A new repair shop and garage has been opened on Central avenue, Titusville, Pa., under the style the George B. Smith Garage.

Under the style Schiff & Baum a new concern has "opened up" in Dublin, Ga. They will deal in both automobiles and supplies.

Galen Crow, a capitalist of Guthrie, Okla., is building a fireproof garage on the ground of the former Airdome. He purposes operating a renting service.

E. E. Whitten is building a brick garage on Washington street, between Eighth and Ninth streets, Denver, Colo. It will cost, when complete, \$10,000.

At an estimated cost of \$5,000, Joseph C. Trees is building a garage on Highland avenue, Pittsburg, Pa. It will be two stories high, with plate glass front.

John Shinn has erected a brick garage on Court street, Houma, La. He will do general repair work, in addition to operating an automobile livery service.

Work has commenced upon the erection of a new garage at the northeast corner of Law and Court streets, Allentown, Pa. E. A. Krause is building it, at a cost of \$7,500.

A two-story brick garage is in course of construction at 444-48 North Sixtieth street, Philadelphia, Pa., which will cost, when complete, \$7,000. Stephen R. Manley is the owner.

The Oxnard Garage & Machine Shop, of Oxnard, Cal., has been consolidated with the Dunn Mfg. Co., of the same place. The business will be continued under the latter name.

Karl J. Fronheiser, bookkeeper of the Union National Bank at Johnstown, Pa., has resigned his position and opened an automobile salesroom. He will handle the National line of cars.

Milwaukee has another exclusive electric

garage in the Yahr Electric Vehicle Garage, which just has been opened at 241 Wisconsin street. The concern will handle the Boorland electric.

The Lake Shore Tire Shop is the style of a new concern which has been established at Sheboygan, Wis. It will make a specialty of repairing and vulcanizing, as well as selling automobile tires.

The Wilson Goucher Co., an automobile tire salesroom and "hospital," has opened up in Washington, D. C., at 1705 Fourteenth street. Diamond tires will form the chief stock-in-trade of the new concern.

A. W. Shattuck, vice-president and manager of the Rambler Garage, Milwaukee, Wis., has resigned his position. Until a successor can be appointed, M. B. Gilman, from the Rambler factory, will be in charge.

Henry Ruel, of Pittsfield, Mass., has purchased a large piece of land at the corner of Depot and Maple streets, North Adams, Mass., and will erect thereon an up-to-date garage. It is to be opened early in the fall.

G. J. Batzer, formerly superintendent of the Rapid Motor Vehicle Co., has branched out for himself and opened a garage on Water street, Pontiac, Mich. The building is two stories high and will be known as the Economy Garage.

H. B. Hannable has been appointed district manager of the Regal Motor Car Co., for the states of Washington and Oregon, which formerly were covered by the San Francisco branch. A new branch is to be established at Spokane.

A large sales and service department is being erected for the Halladay Motor Car Co., of Chicago, Ill., at 2029 Michigan avenue. It will be two stories high, of concrete and marble, and fitted throughout in the most modern manner.

L. J. Remington, half owner of the Fond-du-Lac Auto & Tire Repair Co., has sold his interest to Henry Schwartz, formerly of the Clark Motor Co. The concern is located at the corner of Main street and Western avenue, Fond du Lac, Wis.

Dr. H. C. Wendel and Joseph Berning, who were concerned in the recent receivership proceedings against the Cadillac Automobile Co. of Cincinnati, have formed the Guarantee Auto Co., in Cincinnati, Ohio. They will handle Regal and Republic cars.

A petition in involuntary bankruptcy has been filed against the Atlanta Motor Car Co., of Atlanta, Ga., by the Atlanta Buggy Co., the Standard Oil Co., and other creditors, whose claims aggregate about \$2,300. The company is incorporated for \$15,000,

and is said to have consented to proceedings against it.

The Ogden Garage is the style of a new establishment which has been opened on Ogden avenue and Parmenter street, Menominee, Mich. William Jensen is the manager and chief owner of the concern, which is incorporated as the Ogden Garage Co.

The Lane & Lynch Auto Co., which heretofore has been located on Locust street, near Spring street, St. Louis, Mo., has found its quarters too small and moved to 3206 Locust street. The new store is 32 x 100 feet and thoroughly modern in every respect.

Frank B. Cooke, of the Oneonta Auto Co., Olean, N. Y., has purchased a large plot of ground on Market street, in the same town, on which to erect another large garage. The new building will be of reinforced concrete throughout, two stories high, 60 x 90 feet.

Philip Heup has purchased the garage of the Menasha Auto Co., on Milwaukee street, Menasha, Wis., succeeding Rudolf Felch as owner. The garage was established about a year ago under the style Felch & Sutton, but for the past six months has been owned solely by Felch.

L. A. Holthouse, proprietor of the Fashion Stables, has added automobiles to his livery business and built a garage adjoining his stables on First street, Decatur, Ind., with entrances on two parallel streets. In addition to doing a general automobile livery business he will sell Overland cars.

The Capital Garage Co. is the style of a company which just has been organized in Montpelier, Vt., with quarters in the Blanchard block on Main street. The company is composed of: W. H. Farrar, president; L. J. Emmons, vice-president; M. H. Farrar, treasurer; B. E. Bailey, secretary.

Internal dissensions among the officers and directors of the F. A. Trinkle Automobile Co., Denver, Colo., came to a head on July 18, when Judge Shattuck, of the district court, ordered two of the directors, J. A. Pierce and F. A. Cover, to call a stockholders' meeting and to amend the articles of the corporation so as to provide for five directors instead of three. The court was petitioned so to do by F. A. Trinkle, president and majority stockholder of the company, who stated that this step was taken to prevent the two directors named from squandering the assets of the concern, from unnecessary extravagance, etc. The company operates a salesroom and garage at 1555 Tremont street.

The Way to Suppress Horn Tooters.

The campaigns against unnecessary street noises are laudable; the chief trouble is that the campaigns themselves are usually full only of sound and fury. They arise only to die out with little or no accomplishment. That there is too much tooting of automobile horns and that the "too much" constitutes unnecessary noise is undoubted, but writing letters of protest to the public press and generally railing at the offense serves no purpose. Action is necessary.

In some communities laws already exist which, if enforced, would subdue the evil; in others such laws should be enacted and enforced, for without enforcement no law is worth the paper upon which it is printed, which is the real trouble with most laws. It is folly to contend that the electric warning signals now employed on automobiles are unnecessary; the bulb horn long since was proven inadequate for all purposes; the newer and louder horns contribute to public safety; they cannot be dis-

pensed with. The way to prevent their abuse. The way to abate the unnecessary noise which, on occasion, they are made to create is plain enough; their use should be regulated by law, and it is a wholesome sign that the foremost makers of such devices—the Klaxon—are lending themselves to such a campaign.

If one-half of the energy used in making arrests for violation of smoke ordinances were directed against the chronic horn tooters, the evil would be more easily and as effectively checked.

New Jersey and Other States.

Having attempted by threats or bluffs, or both, to coerce the Legislature of New York into doing his bidding, and having failed in the effort to force New York to enact a repulsive law, it was quite natural that New Jersey's Commissioner of Motor Vehicles should put up the bars against New Yorkers. Had he failed to do so, he would have become more of a laughing stock than has been the case since he so suddenly and so tardily became thoroughly infused with the bile of Frelinghuysenism.

There was a time when the commissioner appeared to be a high minded official, unfortunately placed, but seemingly he has heard his master's voice in no uncertain tones, and has degenerated into a mere political tool who is obeying orders to save someone's political face, even though the whole State suffers and is made ridiculous. The manner in which he brought to bear a provision of the New Jersey law clearly designed to exclude offenders and not entire populations suggests nothing else, the commissioner himself being a mere employee and not an elected official of the State.

When first he brought the exclusion order to bear against Pennsylvania, he set up as an excuse that in that State New Jerseymen were being subjected to unwarranted arrest and "persecution." He could find no such excuse in New York. He could prattle only about "real reciprocity," which he claims has its abiding place only in New Jersey, although New Jerseymen can enter New York and every other State free of charge whenever New Jersey removes its miserable demand for a dollar's worth of the flesh of all non-residents. In fact, New Jerseymen can freely enter Connecticut and several other States in spite of their State's demand, and nothing better serves to illustrate the utter inconsistency and utter untenability of the

New Jersey law and the commissioner's definition of "genuine reciprocity."

Connecticut charges New Jerseymen nothing, but no resident of Connecticut dare turn an automobile wheel in New Jersey until he has yielded up a dollar. When recently a resident of Connecticut remarked this peculiar phase of "reciprocity" to the New Jersey commissioner and asked for light, the best the commissioner could do was to forward a blank form showing how the Connecticut motorist could pay the much beloved fee. Taking the New Jersey view, and in the interests of its residents, it would seem therefore that the Connecticut officials are lax in their duty if they fail to insist that New Jersey shall adopt their truly genuine form of reciprocity and cease "shaking down" the citizens of the Nutmeg State.

However, whenever New York or the rest of the United States bows to the dictates of a New Jersey employe or to the demands of a portion of the New Jersey Legislature and is coerced into copying its offensive and un-American law, it will be time for the residents of such states to hang their heads for very shame. There's a day of reckoning coming for a handful of New Jersey politicians, and if the motorists of the State do not hasten it, they are unworthy of the right to cast a ballot.

Activity in the Materials Market.

After many months of sluggishness a brisk demand has sprung up in the material market that is causing numerous salesmen and dealers associated with the automobile industry to resume their wonted air of cheerfulness. Not that the conditions which have prevailed have been the cause of undue pessimism, but rather that the slackened demand has proved one of those puzzling conditions that sometimes test the wisdom of even the most experienced traders to explain. Just why automobile builders should be able to go on producing cars seemingly at an undiminished rate when they had cut down their requisitions, in some instances almost to the vanishing point, was something of a poser. It began to appear as though the art of making something out of nothing at length had been discovered.

With the renewed call for parts and material, however, the situation has been made clearer. Following their previous manufacturing season, many makers found themselves overstocked with materials. Orders for stated delivery had been placed away

ahead, and with the completion of the models which now are being closed out at retail and the accompanying let-up in activities, it was found that stockrooms were becoming crowded with no immediate prospect of relieving the congestion. Thus it happened that many parts and materials salesmen were turned from door after door with light order books. That they should receive such receptions at a moment of apparent prosperity in the industry and when the business world at large was in no apparent disquietude, was what caused brows to wrinkle.

The early summer and prolonged dry season of the present year have caused a noticeable quickening in the entire industry, the retail world is experiencing no difficulty in moving its cars. Rather, in some instances, the difficulty is entirely one of supplying the demand. Simultaneously the manufacturers are beginning to run short of their hoarded materials and are buying freely. It is stated on good authority that there has been no recent year when car makers were so nearly cleaned up on raw stock as they are at present. Consequently the hosts of alarmists once more are put to scorn.

"Seasons" in Truck Demonstrations.

In measure with the growth of the opinion that there no longer is a distinguishable "season" in respect to the sale of pleasure cars, it becomes equally apparent that there is a commercial vehicle season; if not in the sale thereof, at least in the demand for demonstrations. Demonstrations, of course, are associated in the mind of the eager tradesman with actual sales, though sometimes the association is exceedingly remote. So it appears to be when it comes to motor trucks and delivery wagons.

Assuming that there is a reason for all things, and analyzing the situation no more than casually, it would seem that the truck demonstration "seasons" come and go in waves, like the hot weather—coincidentally with it in fact. A sort of off-season rush also has been observed when heavy snows cover the ground. Always it is heaviest when horses are slipping or otherwise suffering.

The demonstration evil is familiar enough in the automobile industry; but the introduction of the rush feature is a decided novelty. Moreover, the plight of the salesman is not without its humorous element,

July 22-28, Minneapolis, Minn.—Minnesota State Automobile Association's third annual endurance run from Minneapolis to St. Paul to Helena.

July 29, Cincinnati, Ohio—Hill climb under auspices Cincinnati Automobile Dealers Association.

July 29, Philadelphia, Pa.—Racemeet under auspices of Quaker City Motor Club at Point Breeze track.

August 1, Chicago, Ill.—Reliability contest for motor trucks under auspices of Chicago Evening American.

August 3-4-5, Galveston, Tex.—Racemeet on Beach under auspices of Galveston Automobile Club.

August 7, Chicago, Ill.—Chicago American's reliability run for commercial vehicles.

Aug. 8, St. Louis, Mo.—Reliability contest under auspices St. Louis Automobile Manufacturers and Dealers Association.

August 12, Detroit, Mich.—Track race-meet, State fair grounds.

August 12, Philadelphia, Pa.—Quaker City Motor Club's annual reliability trial for pleasure cars.

Aug. 12, Worcester, Mass.—Worcester Automobile Club's sixth annual hill climb on Dead Horse Hill.

Aug. 17, St. Louis, Mo.—Reliability contest under auspices Missouri Automobile Association.

August 25-26, Elgin, Ill.—Chicago Motor Club's national stock chassis road races.

Sept. 1, Oklahoma, Okla.—Reliability contest under auspices of the Daily Oklahoman.

Sept. 2-4, Brighton Beach, N. Y.—Racemeet under management of E. A. Moross.

Sept. 4, Denver, Col.—Denver Motor Club's racemeet on motordrome.

September 4-5, Brighton Beach, N. Y.—Twenty-four hours race under management E. A. Moross.

Sept. 7-8, Philadelphia, Pa.—Philadelphia Auto Trade Association's racemeet.

Sept. 7-9, Hamline Track, Minn.—Minnesota State Automobile Association's racemeet.

Sept. 7-10, Buffalo, N. Y.—Reliability contest under auspices Automobile Club of Buffalo.

Sept. 9, Bologna, Italy—International road race for the Italian Grand Prix over the Bologna circuit.

Sept. 12-13, Grand Rapids, Mich.—Michigan State Automobile Association's racemeet.

Sept. 15, Knoxville, Tenn.—Track meet, Appalachian Exposition.

Sept. 16, Syracuse, N. Y.—National Circuit track meet, State Fair grounds.

Sept. 18-20, Chicago, Ill.—Reliability contest for motor trucks, under auspices of Chicago Motor Club.

Sept. 23, Lowell, Mass.—Road races under auspices of Lowell Automobile Club.

Oct. 2-7, St. Louis, Mo.—St. Louis Automobile Manufacturers and Dealers' Association's open air show.

Oct. 3-7, Danbury, Conn.—Track meet under auspices Danbury Agricultural Society.

October 7, Philadelphia, Pa.—Quaker City Motor Club's 200 miles race at Fairmount Park.

Oct. 9-13, Chicago, Ill.—1,000 mile reliability contest under auspices Chicago Motor Club.

Oct. 12-22, Berlin, Germany.—International automobile show in Exhibition Hall, Zoological Garden.

Oct. 13-14, Atlanta, Ga.—Racemeet under management H. C. George.

Oct. 16-18, Harrisburg, Pa.—Reliability contest under auspices Motor Club of Harrisburg.

Nov. 1, Waco, Texas—Racemeet under auspices Waco Automobile Club.

Nov. 2-4, Philadelphia, Pa.—Reliability contest under auspices Quaker City Motor Club.

Nov. 4-6, Los Angeles, Cal.—The Phoenix road races under auspices Maricopa Automobile Club.

Nov. 9-12, San Antonio, Texas—Racemeet under auspices San Antonio Automobile Club.

Nov. 9, Phoenix, Ariz.—Track races under auspices Maricopa Automobile Club.

Nov. 27, Savannah, Ga.—Vanderbilt Cup races under auspices Savannah Automobile Club.

Nov. 29, Savannah, Ga.—Grand Prize road race under auspices Savannah Automobile Club.

Nov. 30, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

Dec. 25-26, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

especially when the once interested prospect becomes indifferent as soon as the falling or rising thermometer indicates that he can safely put his horses to work again. It might not be so humorous, were it not

that, in his eagerness to prove the worth of his product, the salesman frequently drives it beyond its legitimate capacity, probably to the secret amusement of the "wise" teamster.

DE PALMA AND TOWERS THE LIONS

They Make Biggest Hauls at Guttenberg Meet—Runaways the Rule and Small Cause for Excitement.

Ralph De Palma in a Simplex was the star performer at the postponed racemeet held Saturday last, 22nd inst., on the Guttenberg (N. J.) track. About 3,000 persons saw him finish first in two of the six contests on the card, including ten miles free-

with piston displacement under 301 cubic inches, seven cars came in line. De Palma drove a new Mercer, it having been delivered to him the evening before the meet. He made a bad start, however, and at the end of the first mile, with Towers in an E-M-F leading, he was in fifth place. Towers ran away from the others and finished away ahead in 5:28 $\frac{3}{4}$.

In ten miles for cars not exceeding 451 cubic inches displacement De Palma and the Mercer showed to better advantage. The outcome was in doubt until the finish.

ond place. The pair alternated in the lead for a mile, after which Lainberg shook off Tower and set sail for Rouse. At the end of the ninth mile Rouse had engine trouble with the Marmon and Lainberg took the lead on the back stretch and won, easing up, in 11:13 $\frac{1}{2}$. Rouse was second and De Palma snatched third place from Tower almost on the tape.

De Palma started his winnings in the fifth event when he abandoned the Mercer for the Simplex. This was open to cars of 601 cubic inches displacement and he won with ease. Lainberg started his National across the line ahead of the starting gun and De Palma lost a few seconds protesting. However, he gained ground rapidly and went into the back stretch ahead of the National, followed by the Marmon and the Jackson.

The summary:

Five miles, non-stock, class E—Open to any car or chassis under 231 cubic inches piston displacement—Won by Towers (E-M-F); second, Craig (Paige-Detroit); third, Ferguson (Lancia). Time, 5:47 $\frac{1}{2}$.

Five miles, non-stock, class E—Open to any car or chassis under 301 cubic inches piston displacement—Won by Towers (E-M-F); second, Burke (Pullman); third, Craig (Paige-Detroit). Time, 5:38 $\frac{3}{4}$.

Match race at five miles between Du Closne (Staver-Chicago) and Gillam (Correja)—Won by Du Closne. Time, 6:40 $\frac{1}{2}$.

TOWER LEADING LAINBERG IN THE TEN MILES RACE

for-all, the feature event of the day. They also witnessed his defeat in two other races, when he drove a car that was new to him.

Jack Towers in a little "red-arrow" E-M-F divided honors with De Palma, capturing two events by good margins, in one of which De Palma, in a Mercer, started but withdrew at the end of the fifth mile.

The feature event was the free-for-all, in which there were six starters. Rouse, driving a Marmon, got off in the lead, closely followed by Lainberg in a National, with De Palma's Simplex third. The latter passed the leaders on the first turn and tore away from them down the back stretch. At the first mile De Palma led by fifty yards, with Lainberg in second place. Rouse's Marmon was third with the Pullman a close fourth. The Jackson dropped out at the end of the mile. At the finish the Simplex led by 50 yards, De Palma crossing the line in 10:31 $\frac{1}{2}$.

There was no struggle in the first event, in which there were four starters. It was at five miles for non-stock cars with piston displacement under 231 cubic inches. Towers in the EM-F was the quickest at the getaway and on the first turn led Craig in a Paige-Detroit by little more than a length. The other two cars fell back, Ferguson driving the Lancia in third place. Towers finished about a quarter of a mile in front of Craig, who was an equal distance ahead of Ferguson. The time was 5:47 $\frac{1}{2}$.

In the second event at five miles for cars

SHOWING DE PALMA IN THE ACT OF LAPPING THE STAYER CAR

There were six starters, Rouse in a Marmon getting off in the lead. Tower in an E-M-F was second, a half a length away, with De Palma in the Mercer trailing a length behind. The first three cars raced down the back stretch abreast while Lainberg, in the National was immediately behind waiting for an opportunity to get around them. They continued in close order until the third mile, when Lainberg found an opening and shot the National ahead of De Palma's Mercer. Lainberg pulled away and for the next three laps it was a bitter struggle between Lainberg and Tower for sec-

Ten miles, non-stock—open to any car or chassis under 451 cubic inches piston displacement—Won by Lainberg (National); second, Rouse (Marmon); third, De Palma (Mercer). Time, 11:15 $\frac{1}{2}$.

Ten miles, non-stock, class E—open to any car or chassis under 601 cubic inches piston displacement—Won by De Palma (Simplex); second, Lainberg (National); third, Rouse (Marmon). Time, 10:43 $\frac{1}{2}$.

Ten miles, non-stock, class D, free-for-all—Won by De Palma (Simplex); second, Lainberg (National); third, Rouse (Marmon). Time, 10:31 $\frac{1}{2}$.

MOTOR CAR RELIABILITY SHOWN IN ODD AND OUT OF THE WAY USES

Motor Traction in Logging Operations—It has been said that about the only work for which the commercial vehicle is unsuited is in the woods, where roads are poor or non-existent. The picture refutes the contention and shows a Sampson truck in use in a New Hampshire forest.

"Seeing America First"—A Midland Forty transcontinental pathfinder pictured amid the scenic wonders of the Rockies. Halting beside a monolithic sentinel near Buena Vista, Colo.

Where Solidity Counts—A captive balloon requires a firm anchorage. The Mais truck successfully "holding down" one of 100,000 cubic inches capacity at the Indianapolis Speedway.

Motor Traction in Rural Road Building—An Indiana contractor by using his Maxwell car to haul an ordinary farm wagon has been able to supplant five teams. The picture shows the rough and ready nature of the arrangement, which is far more efficient than at first might appear.

MR. SMITH EXCLUDES NEW YORKERS

**Failing to Coerce New York Legislature,
He Puts up Bars in New Jersey—Non-
Resident Licenses Withdrawn.**

Like Pennsylvania and Delaware folk, New Yorkers no longer can enter New Jersey, which popularly is supposed to be a part of the United States. Mr. Smith says so, and what Mr. Smith says goes—in New Jersey. He has brought the Chinese exclusion act to bear, and though it clearly was meant to exclude only offenders and other undesirables, Mr. Smith and his masters discovered that it gave them power to exclude all the world, if they so desired. And the motorists of all of three States are on Smith's list of "undesirables." He handed down his proclamation affecting New Yorkers on Monday last, when he canceled all of the New Jersey licensing agencies in New York and instructed that no more eight-day non-resident licenses be issued.

Mr. Smith has not suddenly become President or Emperor of the United States, nor even King or Governor of New Jersey. He never was elected to any office. He merely is holding down a salaried job in Trenton, where the New Jersey politicians gather and where "Joe" Frelinghuysen, who fathered the exclusion act, plays the part of a Senator, when he is not busy with insurance, and other affairs in New York City. Smith's job is that of Commissioner of Motor Vehicles, which was created by Frelinghuysen; it pays something like \$30 per week. But as commissioner, he can say who shall or shall not enter the State.

Of course, the law isn't exactly an exclusion act; Smith and some others call it a reciprocity law, with New Jersey defining the extent and price of reciprocity. If the law of your State is unlike the law of Mr. Frelinghuysen, it is not reciprocal, and if your State does not wheel into line with New Jersey and change its law, Mr. Smith is likely to get mad and keep you out, unless you pay the New Jersey price. No other State in the Union has such a law as New Jersey, but Mr. Frelinghuysen, what cares he? He's a regular law manufacturer and knows what's what; the rest of the world knows nothing.

Mr. Smith was not always such a "hot one." Some of his friends used to suggest that applying certain phases of the law was distasteful to his sense of justice. But something came over the spirit of Smith's dreams during recent months and he became a "bold, bad man." He shut out the people of Pennsylvania and Delaware, and conveyed the intimation or intimidation to the New York Legislature that if it did not alter its law to conform with New Jersey's, he, Smith, would shoo New Yorkers out of his State or make them pay the limit to

come in. According to one report he even went to Albany to impress his views in official circles. He is said to have returned to Trenton with a soul full of hope that he had forced the Empire State to do his bidding. But knowingly or otherwise, the New York Legislature gave Smith the laugh. It refused to be either coaxed or coerced. It adjourned on Friday with the New York law unchanged. Then Smith rose in his might. On Monday he sent forth his fateful order, calling in all the eight-day \$1 blanks that remained in New York and canceling the power of agents to issue them.

Now New Yorkers must pay \$3, \$5 or \$10 for New Jersey yearly licenses just like the Jerseymen themselves, and the Jerseymen they must pay from \$5 to \$25 to enter New York, according to the horsepower of their cars. Whenever New Jersey repeals its \$1 eight-day law, its citizens can come into New York without paying even a sou-markee.

Three More Start Globe-Girdling Tour.

Around the world in an automobile is the way P. J. Wires, of Indianapolis, Ind., proposes to combine business with pleasure. Being the owner of a large touring car he left that city on Tuesday last, accompanied by Mrs. Wires and R. W. Shank, headed for San Francisco. Wires, on account of failing health, has been forced to lead a life in the open air, and concluded to take the motor trip. The party expects to be gone between three and five years. It is proposed to camp out at night, instead of going to a hotel, and for this purpose a complete outfit is carried. Not being a wealthy man, Wires intends to make expenses by selling accessories, and collecting material for a book of his travels.

Arrest Upsets a Chauffeurs' "School."

Ralph R. Shaft, who conducted the Great Western School of Motormen at 219 Seventh street South, Minneapolis, Minn., has been arrested on a charge of grand larceny brought by John Criffin, one of the "pupils" of the "school," who claims that Shaft stole \$35 from him. The school advertised to make competent chauffeurs in four weeks and "guaranteed" eighty dollars a month to its "graduates." Shaft had been arrested on a similar charge some months ago, but was not indicted by the Grand Jury. Other complaints of a similar nature have been filed by three other "students" of the school.

For a National Association in Canada.

The Winnipeg Motor Trades Association is attempting to bring about the organization of a national association in Canada, where none exists. To that end it is in correspondence with the trade bodies in Toronto and Montreal. The idea in view is an organization that will deal not only with shows and other trade affairs but with racing and all other forms of competition.

"IF" BIGGEST ENTRY IN GLIDDEN

**Tour Will Occur "Sometime in September"
If—Eleven Entries in Hand and Nine-
teen More Are Needed.**

If—it's a little word, but full of meaning—if thirty entries are in hand by August 1, the Glidden reliability tour will occur "some time in September." It is not necessary to fix the date unless the thirty entries are in hand.

When the "some time in September" announcement was made, early this week, by the A. A. A. officials, the entries of exactly eleven cars had been recorded; which means that unless a great rush occurs within the next four days it will not be necessary to fix any date at all.

The eleven entries already booked are three Maxwell cars, three Abbott-Detroits, one Cunningham, one Oakland, one McIntyre, one Ohio and one Washington, each entered by its respective maker; and the Cunningham is designated "pace-maker."

Those possessed of good memories will recall that the Glidden tour originally was slated to occur June 21 to 29, but was postponed because—ahem! because of the reluctance of manufacturers to enter their 1911 models and their inability so early to nominate their 1912 productions. That this alleged cause of postponement was based on fact of a peculiar sort is made evident by the present list of entries, which shows that of the eleven cars only the three Maxwells are 1912 models.

If the thirty entries are received by Tuesday next, and if a date is set, the tour will traverse the route originally laid out, from Washington, D. C., to Ottawa, Canada, where there was a promise of ice cream and lemonade awaiting in June last.

Buffalo Sets Dates for Its Contest.

Buffalo motorists again will have an opportunity of competing for the Laurens Enos and other trophies, the Automobile Club of Buffalo having selected September 6, 7, 8 and 9 as the dates for its second annual reliability tour. It will cover a course of 800 miles in Western New York from Lake Erie to Lake Ontario. Following the precedent of last year each day's run of 200 miles will start and finish in Buffalo. The Enos trophy was won last year by Charles F. Monroe, in a Maxwell.

Galsters Heads New Automobile Club.

Petosky, Mich., now has an automobile club—the Petosky Auto Club. It was organized last week with these officers: President, John L. A. Galsters; vice-president, Guy G. Hankley; secretary, Homer Sly; treasurer, C. E. Church; directors, D. Charles Levinson, Clare Harding, W. S. Mesick and the officers.

THREE PERFECT IN WISCONSIN RUN

Technical Examination Marred Six Unclouded Road Scores—Babcock Captures Trophy for Private Owners.

August Jones, who drove a Cadillac, Harry Bisbie, who piloted a National, and William Jones, who handled a Case, were the only contestants who came through the six-day reliability run of the Wisconsin State Automobile Association July 17-22 with perfect scores. Of the nineteen cars which started from Milwaukee, as told in last week's Motor World, two dropped out and the seventeen others went through the 963 miles without serious mishaps.

The contest was unusual and praiseworthy in that it included a class for private owners, who were not required to undergo the final technical tests. Three owners competed for the special prize that was offered, which was won by J. D. Babcock, who drove a Franklin. One of the others, M. L. Stevens (Kissel), withdrew after the third day's run, on account of a broken spring.

Starting from Milwaukee Monday morning the 17th inst. on the first leg of the journey, the contestants went due north, Marinette being the objective point. Some of the best roads of the entire trip were traversed during these 190 miles, and only four penalties were imposed. George Browne, driving a National, got 10 points for losing a bearing on the rear axle; H. W. Stevens drew down three points for not stopping his Franklin at Port Washington the required three minutes; Jesse Mack lost ten for stopping his Petrel motor and three for taking on water. The Auburn, with C. Hacksdorf at the wheel, failed to report at the night control. The rear axle broke five miles South of Green Bay, and he remained over to replace it. Hacksdorf reached Marinette in time to check out the second day and was assessed 1,467 points.

Wausau residents gave the contestants a warm welcome at the completion of the 171 miles, which were covered on the second day. The start from Marinette was made at 7 o'clock in the morning and part of the roads covered on the first day were retraversed. Lunch was served at Shawano, where a large crowd greeted the visitors. From there the route led through the Menominee reservation, where some novel sights were encountered. It happened that the Indians were having their annual dance and the manoeuvres of the bucks were watched with interest by the motorists as they passed through. A short stop was made at Merrill. The rest of the trip was through a sea of mud, as rain, which began falling shortly after noon, made the going very bad. Emil Hokanson's Buick was the first in Wausau, and he was shortly followed by George P. Hewitt in a Buick and

Charles Merz in a National. The rest of the cars followed in good shape, and only three penalties were inflicted. C. Hacksdorf's Auburn was again unfortunate, being assessed nine points for arriving late. The Regal, entered by C. H. Delafield, was penalized 17 points also for being late, and J. D. Rockstead's Warren-Detroit lost 12 points for slipping a clutch.

The third day's run, the longest trip of the week—203 miles—was started under the most unpromising conditions, and only nine contenders retained their clean scores at nightfall. Mud of the slipperiest kind was encountered during most of the morning, but late in the afternoon a splendid macadam road led the motorists into La Crosse. Owing to the distance, no noon control was established. At Marshfield the local automobile club served lunch, while the cars were parked for twenty-five minutes. The roads from Marshfield to Black River Falls were very rough, and after the Falls were passed the highway was merely a bed of sand, with intervening stretches of clay and cobble stones until Sparta was reached, and the macadam road began. The penalties for the day were 16 points against J. Nicolozzo's Buick, for taping a gasoline pipe; 35 points against C. H. Delafield's Regal for taking oil and water and making adjustments, and three points against John Kemp's Overland for taking oil.

Leaving La Crosse, Lancaster, 128 miles, was the next night's control. It was between these two points that Lewis Strang, the famous driver, met his death, when the car went over an embankment, twenty miles from Richland Center. Strang was driving the members of the technical committee, and was hurrying ahead in order to reach Lancaster to check in the cars. This was the only accident of the run. As a mark of respect to the deceased pilot, crepe was worn on the arms of the motorists for the balance of the trip. The penalties imposed took away the perfect score of Diener (Ford), who was assessed one point for his failure to start the motor in time, the engine bucking on him and a half minute being consumed in cranking. C. H. Delafield's Regal lost 15 points and Dominick Nicolozzo's Franklin 2 points. Jesse Mack, who lost 10 points on the first day out, withdrew his Petrel on account of hub trouble, for which he had been penalized 227 points. M. L. Stevens also withdrew his Kissel car and shipped it back to Milwaukee owing to a broken spring.

It was 7 o'clock in the morning when the first car left Lancaster for the fifth day's run, headed for the night control in Jamestown, 159 miles distant. All along the route the dust lay on the road anywhere from two to six inches deep, and the progress of the cars was marked by a dense cloud, which was so thick behind each car that at times it was almost impossible to discern the road. There were only a few hills to climb, however, and they were easy ones. Waterbars, however, caused several

of the cars to be penalized. Madison was the noon control, and there the motorists were entertained by the Hokanson Automobile Co. Incidentally, Emil Hokanson, who won the sweepstake trophy last year, was put out of the clean score column because his Buick was penalized 9 points on account of adjustments. At Mineral Point a circus was encountered, and the double attraction brought out the whole town. All the cars reached the night control before the time scheduled, although short stops were made at Darlington, Dodgeville, Stoughton, Edgemere and Janesville.

It had been planned to make short stops in Racine and Kenosha on the way to Milwaukee, for the last 122 miles of the tour. No stop was made in Racine, however, but at Kenosha the officials of the J. I. Case Threshing Machine Co. met the motorists and thanked them for the sympathy extended on the death of their driver, Lewis Strang.

After the cars had checked in at Hotel Pfister, Milwaukee, they immediately proceeded to Fourth and Cedar streets, where the final tests were made. A course was laid out on Fourth street and the brakes were tested. Going at the rate which they were scheduled on the road, the cars were required to stop within fifty feet, and six cars were able to do this with foot and emergency brakes, thus getting a clean score on the test. These were Jonas's Cadillac, Bisbie's Imperial, Jones's Case, Browne's National, Wetmore's Krit and Diener's Ford. After this event the cars went to State street hill where a test of motors, transmission, clutch and gear set was made.

There were but four penalties imposed as the result of the last day's run, and six cars pulled into Milwaukee with perfect scores, but after the final tests but three had clean scores. They were the Cadillac, entered and driven by August Jones, the Imperial entered by the La Crosse Plow Works and driven by Harry Bisbee, and the Case car, entered by the J. I. Case Threshing Machine Co. and driven by William Jones.

The contestants in the private owners' class did not have to make the brake nor other tests in Milwaukee. Hacksdorf (Auburn) was unfortunate on the first two days out and lost 1,488 points, and M. L. Stevens having withdrawn, left J. D. Babcock (Franklin) an easy winner of the Schandain trophy despite his loss of 17 points.

The other penalties imposed were: W. G. Wetmore (Krit), one point; Emil Hokanson (Buick), nine points; J. Nicolozzo (Buick), 55 points; Harry Johnson (Buick), 104 points; A. J. March (Reo), four points; H. N. Westwood (Imperial), six points; George Browne (National), 10 points; J. Diener (Ford), one point; John Kemp (Overland), eight points; Dominick Nicolozzo (Franklin), 116 points; J. D. Rockstead (Warren-Detroit), 14 points; C. H. Delafield (Regal), 50 points.

HOW MINNESOTANS ARE GOING TO HELENA

Nine Days' Reliability Tour That Looms Large—Unusual Doings in a Region Not Famed as Touring Ground—Special Train and a Railroad President Play Conspicuous Parts.

MINNESOTA STATE ASSOCIATION TOURISTS DRAWN UP AT THE ST. CLOUD DEPOT

Minneapolis, July 20.—With the Glidden tour "on the shelf" the third annual reliability tour of the Minnesota State Automobile Association, which left here this morning should come pretty close to being "the" reliability contest of the year 1911.

It is a third grade tour, or rather a tour of the third grade, which, however, is no reflection on the contest and merely means that there will be no technical tests or examinations when the destination is reached. The destination is Helena, Mont., 1,288.5 miles distant.

Being a contest of the third grade only road performance will count in the final result, and, believe us, there is a lot of road between Minneapolis and Helena. It is of all sizes, shapes, depths and conditions. Mighty little of it is of the boulevard variety, and this Minnesota tour is not exactly a tour for tenderfeet.

When it started this morning a gentle rain was falling, but it served to dampen few spirits, if any. Nineteen actual contenders received the word. There also was a string of non-contestants who will trail behind, or in front, if they are fast enough to stay in front.

The nineteen contestants are as follows:

1. O. W. Close.....Maxwell.
2. John Fawkes.....Marmon.
3. Philip Wiseman.....Amplex.
4. O. A. Palmund.....Halladay.
5. C. L. Bonwell.....Kissel.
6. Chris. Rice.....Kissel.
7. J. Sackow.....Pierce-Arrow.
8. E. B. Stimson.....Hupmobile.

9. A. N. Smith.....Aboott-Detroit.
10. J. H. Prior.....Stoddard-Dayton...
11. M. J. Armstrong.....Colby.
12. B. W. Scott.....Flanders.
13. F. A. Witt.....Flanders.
14. George Herron.....Flanders.
15. J. E. Dougherty.....Krit.
16. A. L. McNurlen.....Petrel.
17. B. T. Hoyt.....Cole Forty.
18. A. J. Rose.....Cole Thirty.
19. W. Stork.....Packard.

The itinerary of the tour, which by the way will last nine days, is as follows:

	Miles.
July 20—Minneapolis to Alexander, Minn.	140
July 21—Alexander to Fargo, N. D.	123.8
July 22—Fargo to Devil's Lake, N. D.	194.6
July 23—Sunday at Devil's Lake.	
July 24—Devil's Lake to Berthold, N. D.	159.4
July 25—Berthold to Culberson, Mont.	167.1
July 26—Culberson to Malta, Mont.	183
July 27—Malta to Great Falls, Mont.	210.6
July 28—Great Falls to Helena, Mont.	110

To tell the whole truth, this automobile tour would not be quite so much of a tour if it were not for the Great Northern Railroad. The route lies along the line of that railway, and Louis W. Hill, president of the Great Northern, almost might be styled the patron saint of the tour. He interested himself in it at its very inception, and his interest still is with it, as in fact is Mr. Hill himself; and before or behind us is one of his most luxurious trains, without which food and lodging would be of a rather doubtful character. The road to Helena is not very numerously marked by

large or palatial hotels. The Great Northern train will supply the deficiency. It comprises twelve cars, two of them diners, one a garage car and seven sleepers. The two other cars attached to the train are President Hill's own private car and a private conveyance of John Ringling, the circus man. Messrs. Hill and Ringling also have automobiles at their service and will take to the road when in the mood. But the train will meet us morning, noon and night, and we will sleep and eat aboard it each day and night.

Reuben Warner, Jr., President of the Minnesota State Automobile Association also is a participant and contestant. His is a Pierce-Arrow car, but Dr. Charles E. Dutton, the referee and official representative of the A. A. A., has ruled that the Pierce-Arrow Co., having failed to secure a stock car certificate for its product, the Pierce-Arrow cannot be recognized as a stock car, and therefore is ineligible; the same applies to the Kissel car, but Mr. Warner has let it be known that if either the Pierce or the Kissel finish with scores that entitle them to the awards in their classes the prizes will be delivered, certificate or no certificate; which suggests that the A. A. A. may be visited by something of a squall from this section of the country.

When the referee announced his decision one Pierce-Arrow and the press car were withdrawn, and O. A. Brictson, the

Brookings (S. D.), tire tread manufacturer, who also had entered a Pierce-Arrow immediately offered to send his family home and in their place convey the press men to Helena. As the press men had to go somehow, Mr. Britson's offer was a welcome one, and did not lack quick acceptance.

Alexandria, Minn., July 20.—A slight rainfall, which began just as the tour was ready to start from the club house of the Minneapolis Automobile Club, served to lay the dust and to make the roads smooth and hard for the first day's travel. Partly because of this rain, and the generally good construction of the roads in central Minnesota, the sixty miles to the noon control at St. Cloud were covered without any difficulty and the remaining eighty miles of the afternoon were reeled off with barely a puncture.

At Sauk Center, 112 miles from the start, a "temporary control" was ordered because the people of the town gave the motorists a great reception and entertainment, and it seemed a shame to let them waste their enthusiasm on some one else, just because their home town had been slighted when "controls" were established. On arrival at Sauk Center the Stoddard-Dayton entry reported a blow-out repaired in seventeen minutes; this was the only trouble encountered until the cars rolled into the town, when one of the cars used by the reception committee backed into the Flanders No. 14, bending the latter's lamps and pushing it against another local machine, which "gored" the Flanders in the back.

One of the humorous incidents of the tour was the surprise of the various delegations of citizens from the regular and "special" controls, when they came out to escort the caravan of contestants. They endeavored to fall in line and "to follow the crowd." They followed it all right, but at a respectful distance; for it seemed that their ideas and those belonging to the "tour" varied greatly in regard to what speed was required to make the run. On several occasions offers from local motorists to "guide" or "pilot" the tourists into town had to be refused for the simple reason that their cars could not maintain the pace.

Fargo, N. D., July 21.—The first penalty was incurred to-day. The Krit car was forced off the road in a bad spot and fractured a steering arm. This was repaired in six minutes, netting a loss of only six points. Rumors of other penalties are not confirmed by preliminary examination of observers' notes.

A Packard runabout broke two leaves of a spring, but it is a non-contesting machine with which the owner is fooling the people by announcing on a flamboyant banner that it is a "New York-to-Seattle" car. Tomorrow he will have another banner. To the Westerner the transcontinental trip is a

common one, so much so that the 1912 tour will with little doubt be from the Twin Cities to the Pacific coast. The Westerners appreciate the humor of the banner's inscription.

Only a few tire punctures have been reported, as the roads are as yet free from small stones and no one has yet sprinkled the roads with nails. The Corbin car replaced a blown out tire handily; the Stoddard-Dayton one in sixteen minutes; the No. 14 Flanders in equally good time, and its second record arrival at the noon control one hour and twenty-three minutes ahead of schedule.

Hills, prairie trail roads, sand, newly-worked roads, and an occasional lost route were the difficulties of to-day. Some of the hills were S's with sand at the bottom, and others were easily coasted because of their smoothness. The unworked prairie road with vegetation growing close to the track, taking up excess moisture, has to date provided the best going, indorsing the estimate of drivers in former northwestern tours that if natural roads are left alone, or only King-dragged after rains and allowed to dry, they are the best touring tracks.

The state touring book, prepared by the secretary, C. S. Harrington, has proved exact to date. The only time the trail was really lost was after a slight difficulty with a farmer. His horses were frightened by the siren on the pilot car. They shied and the hay wagon turned over. The farmer is supposed to have changed the confetti to another road. Notwithstanding other directions indicated by the road book, the tourists, many of them, followed the confetti and had to come back after a three-mile detour. This is the only instance to date of discourtesy on the part of a farmer, or any other citizen of Minnesota.

Pilot Harrington took chances to-day and used up a can of spare water for the radiator putting out a prairie fire. A wind match dropped from some one's automobile started the grass burning and it took quick work and the waste of the water to extinguish the rapidly spreading blaze.

Served at each plate at dinner each night is a bottle containing a mystery. The label is as unique as the inscription on the cigars, which is "Spark Plugs." It reads:

"Whizzerino.

'02 P. D. Q.

Denatured Gasolene

Greatest Power Producer Ever Discovered.

A combination of alcohol, gastronomic gasolene and benzene sulphate. Suitable for anybody's transmission. Dilute with water if speedometer shows more than 3 pints per minute. Made in the

Twin City laboratories of Cotton-Dard Harmless Chemical Company. For punctures use Warner's Safe Cure."

Cotton-Dard undoubtedly refers to Referee Dutton and Chief Observer Card. Warner is the state association president, and a contestant.

Last bulletin for night is that the John

Kingling car, which has failed to arrive, a non-contestant Pierce-Arrow, was overturned at Ashby, thirty-one miles from Alexandria. Its top was torn off and windshield broken.

Devil's Lake, N. D., June 22.—At the end of an exciting run of 194.6 miles, the first real tour that the Minnesota State Automobile Association ever had, the motorists, at the finish of the third stage of the tour, are parked beside the hotel train on the shore of the big lake here.

Rain which soaked the gumbo soil for part of the distance called for tire chains, and slushing and slipping the machines traveled for fifty miles in the face of a driving downpour.

The chief happening of the day was the overturning of a Packard runabout on a fifteen foot embankment. Unwise driving by two non-contestants who are not really in the tour caused the trouble. At a point where the road turned sharply around a swale, marked by a red flag, the two men tried to pass the pacemaker car where there was hardly room for one automobile. The right wheels hung a moment over the grass embankment and then slowly turned completely over. The owner, Andrew Berkey, of St. Paul, jumped and got clear of the machine. J. W. Henderson, the chauffeur, slipped as he jumped, went over with the car and then crawled out of harm's way.

After leaving the morning control at Fargo the tourists ran six miles in North Dakota and then resumed the Minnesota trail again until Grand Forks was reached for the noon stop. The roads in the upper Minnesota counties surprised the tourists by their good and well worked condition. In the afternoon the judges began their work of preparing to award two prizes for good roads in North Dakota. One prize is for any county traversed and the other for three counties west of Devil's Lake.

Leaving Grand Forks at noon, the tourists made a control at a mile square aviation field, where a local aviator made his tenth flight in a homemade air ship, in a manner that was pronounced more than ordinary by members of the tour who had seen the most famous of the world's bird men. The contesting cars lined up on a high road and were deserted by their occupants, who sought the aviation field, with permission of the referee, who announced a special control.

Entering Crookston, a large city, the tourists were stopped in the morning by the citizens and given a full luncheon. The hospitality and its form of expression changes as the tour goes north and west, and it has become of a demanding type that insists on emergency controls. Just after luncheon at Larrimore, the people had prepared a big exhibit of flowers and products of the country's big farms. Lemonade was served, but the rain began,

ruined the event and caused an immediate start for the night control. This rain soon transformed the gumbo into slimy stuff that called for chains and careful driving. Stalled engines in non-contesting cars were the chief results of the rain, with most of the entrants near the danger point as to expiration of running time.

Minor accidents marred the day to an extent. Mrs. L. H. Fawkes in the Marmon

reported late to-night, to be liable to penalty when the chief observer inspects the road books, because of damage to his gear shifting mechanism. As yet there are no other penalties, the damage being thus far to non-contesting machines. C. P. Merwin, driver of the pacemaker Corbin, picked up a half hinge to-day in his tire, made by a firm for which he worked eight years. He shook hands with the relic.

spending the evening in various ways, having been able during the afternoon to catch up with Father Morpheus, snatching quantities of sleep from him when he wasn't looking. Their chief occupation, aside from sleeping consisted in reading the first number of "The Carburetter," the fourteen-sheet newspaper printed aboard the "Speedometer," as the hotel train has been dubbed.

Ralph Haynes, son of the entrant of the Cole car, and himself a passenger in the car, received a wire from his father ordering the withdrawal of the car on account of published reports that the steering arm is broken. His answer was a refusal to obey na's orders, as but a small piece was broken from the shift lever and already had safely driven it for two days. He asserted that the damage could be repaired in fifteen minutes. No penalty has been fixed as yet, depending upon the time necessary to make the repair. The Colby entry probably will be penalized for adjusting a broken spring.

Berthold, N. D., July 24.—As expected, the Colby was debited with two points, the Krit also drawing a penalty of 50 points and the Petrel one of three points. The long stretches of sand encountered, combined with the foothills near Devil's Lake, played havoc with the perfect scores which had been obtained heretofore. The Maxwell No. 1 received 121 points for time oc-

CARS PARKED AT ALEXANDRIA, THE FIRST NIGHT CONTROL

entry was removed to the train at Grand Forks with a sprained limb, and John Ringling was similarly afflicted. In the afternoon stretch the pilot and pacemaking cars had a long race with the special automobile train, the observation end crowded with an enthusiastic gallery of people who had chosen to ride in the train for the day. The pace was kept up for thirty-five minutes, without a break.

C. E. Van Duzee, in a non-competing Chalmers 40, came into port to-night with seven leaves broken in the right front spring. He has made up his mind to continue the tour notwithstanding his original intention to drop out to-night.

Tourists now look forward to the change in scenery expected in the run through the state of Montana. The character of the country began to change to-day and is unfamiliar to Minnesota eyes. Indian reservations are to be visited and a belated Fourth of July event is to be given on one of the reservations for the tourists' benefit.

Louis W. Hill, president of the Great Northern road, a non-contestant driver of a Packard, already pronounces the tour the best managed he has ever witnessed. President Reuben Warner, Jr., of the state association, is equally warm in his description of the arrangements. The train feature is found to be excellent after two nights' trial as a lodging house, and much comfort is expected in the day's rest to-morrow.

Cole 30, No. 18, Ralph Haynes, driver, is

MINNESOTA MOTORISTS ARRIVING AT FARGO, N. D., THE SECOND NIGHT CONTROL

Sunday is to be spent at the Devil's Lake Chautauqua and in resting up for Monday's trip to Berthold, 159 miles. The start will be made at 7:30 a. m. One form of entertainment will be the publication of the first issue of "The Carburetter," which will be printed daily on the hotel train for the benefit of the tourists.

Devil's Lake, N. D., July 23.—To-night (Sunday) the cars are parked on the Northwest's noted salt lake, and the tourists are

occupied in repairing gasoline feed pipe, removing carburetter, cleaning nozzle and minor work. Amplex, No. 3, was penalized six points for minor troubles. Halladay, No. 4, was assessed 36 points for soldering gas tank; Petrel, No. 16, broke front springs and ten leaves on back spring, but was put in running condition in twelve minutes.

The heaviest penalization was meted out to the Cole, No. 18, which got 461 points for a whole basketful of trouble; it lost 180 points for driver's work in trying to re-

pair the gear shifting arrangement, which had become locked, and the car had been running on high gear for nearly two whole days; 240 points were chalked up against it for employing an extra man to help in the work, and 41 points for being late at control. Additional penalties will be marked against the Stoddard-Dayton for broken axle. J. H. Prior, who drove the car, took off the wheel, pulled out the axle, was pulled into the next stopping place by a blacksmith, and yet arrived early. He wanted to withdraw, but was prevailed upon to continue the tour. There was a baseball game here, which began at seven o'clock and continued until darkness fell.

Culbertson, Mont., July 25-6.—Gaining one hour at Williston, N. D., by changing from Central to Western time and crossing into Montana at Dondak, in sight of the tree tops of the Yellowstone Valley, the Minnesota tourists to-day traveled 167 miles from Berthold to Culbertson, Mont., both pioneer towns of early days.

When the train arrived at the night control, all got aboard for Popular, Mont., and rode for an hour to the Fort Peck Indian Reservation, where the Sioux gave an entertainment, designed for July Fourth, but postponed in honor of the tourists. This consisted of war dances, squaw dances and a sham battle in full war panoply. The train returned to the night control at Culbertson and the route of the motor cars will be back through Popular to-morrow to Glasgow for noon control and Malta for the night.

The run of 167 miles to-day was over varied country, including stone roads, sand and the finest prairie highway, good for high speed. Roads in North Dakota and Montana to-day appear equal to general run of motoring roads in Minnesota, Wisconsin and Iowa. Tires were given good tests by varying character of the tracks and by the hot sand, which causes blow outs. Numerous tire changes were made, especially across the beginning of the Bad Lands outcroppings, practically every car having to replace tires.

Krit car, No. 15, was towed into noon control with trouble in magneto. The Petrel reported at same point with third spring broken; two having been penalized yesterday.

The Indian doings and frontier dance at Popular took the time of the technical committee, which has not assessed all penalties for this, the fifth day of the run. Those so far announced are:

Haladay, cleaning carburetter, 8 points; Stoddard-Dayton, work on new spring clip, 15; Colby, intake manifold wrapped, 3; Cole, adjusted carburetter, 30; Amplex, adjusting carburetter and stalled motor, 14; Petrel, 83.

The weather to-day was dry and warm and the chief amusement on the road was chasing flickertail gophers and sliding down short dips into dry water gulches across the foot hills.

NINE NEW TYPES IN OVERLANDS

**A 30 Horsepower Touring Car the Feature
—Wide Ranges of Power and Price
in Other Patterns.**

Continuing its policy of building a line of remarkable scope the Willys-Overland Co., of Toledo, O., this week announced that its new line will comprise no less than nine new body styles built on chassis ranging in power from 25 to 45 horsepower, and in price from \$850 to \$2,000. The list will comprise runabouts, roadsters, small and large touring cars, torpedoes and coupes. Straight-line, closed-front bodies will prevail, while the neatly turned curves and finishing touches that have rendered the current models attractive to the eye will be retained with sundry improving modifications, the latter, indeed, amply serving to render the new models conspicuous as such. Clean running boards, concealed door latches and inside control levers will serve to render the different designs at once clean-cut in appearance and in fact.

What appears destined to occupy a most prominent position in the line is the new model 59, which is to be a 30 horsepower touring car, seating five passengers and selling at \$900. The specifications call for a large, roomy car of 105-inch wheel base equipped with a 4 x 4½-inch motor of four-cylinder, L-head construction, a three-speed selective change gear with central control, two ignition systems with one set of plugs, internal-external brakes and 32 x 3½-inch quick detachable tires. The motor has large sized valves, the valve springs being enclosed to suppress the noise and the push rods being lubricated. The clutch is of the reliable cone type and the change gear mechanism is mounted on F & S ball bearings. Semi-elliptical front springs and three-quarter elliptical rear, worm and segment steering gear and semi-float-axle are other of its features. The same chassis also will be equipped with a two-passenger torpedo roadster selling at \$900, and a coupe, the price of which will be \$1,250.

Among other models in the new line will be the 58-R, an \$850 two-passenger roadster equipped with a 25 horsepower 3¼ x 4½-inch motor, 32 x 3½-inch tires, Splittorf magneto, three oil and two gas lamps, generator and tools. Model 60-T, will be a \$1,200 touring car, built to carry five passengers and having a 4¼ x 4½ 35 horsepower motor, 110-inch wheel base, Remy magneto and the same equipment in other respects as the smaller car. The same sized motor likewise will be employed in the model 61-R, torpedo roadster, which otherwise will differ in having a 116-inch wheel base, Bosch magneto equipment and 34 x 4-inch tires. This latter chassis will be sold in addition as a four-passenger torpedo and also as a five-passenger touring

car, both with enclosed front, as a matter of course. All three of these models will sell for \$1,500. Model 61-C, the last named member of the newly announced series, will be a fashionable looking coupe, which will list at \$2,000.

New York's Cars Cost \$5 Per Day.

New York City's Board of Aldermen on Tuesday, 25th inst., listened with expressions of incredulity and dismay to the report of a special committee that had been appointed to investigate the use of city-owned automobiles by the city's servants. The committee reported that joy-riding still exists despite the sternly repressive measures which are reported to have been put forth to check the practice. During the year 1910, it was stated that no less than \$176,570 was expended for the maintenance and operation of 100 city cars, or \$5 a day each. The tentative budget for 1911 called for a sum total of \$107,215, there being 125 cars in use by officials at that time. The Aldermanic report shows that the cars averaged \$2.200 in cost to the city.

The project for enlarging the garage at present maintained under the end of the Brooklyn Bridge was brought to the surface again, as were the suggestions of tagging every car in city service, with signs bearing letters five inches high and the extreme measure of abandoning the present equipment and adopting rental contracts, as already has been done to some extent for emergency purposes. The horrified Aldermen referred the resolutions on the report to the committee on laws and legislation.

Carburetter Device to Assist Starting.

To ensure easy engine starting an English company, the Supplementary Carburetter Syndicate, of Birmingham, has brought out a special form of drip-feed mixer which is intended to be attached to the dash of the car. When about to start the air port of the regular carburetter is closed temporarily and the cocks leading from the supplementary device opened. Of these there are two, one opening directly from the reservoir, while the other is installed below a sort of open sight-feed drip cup. As the fuel drips from the upper opening into the cup air is carried along with it, the result being that a rich mixture is fed to the cylinders until the air-port is opened.

Here's the Compressed-Air Jack.

In adapting an air-starter to its car, the Adams Manufacturing Co., one of the older British builders, has extended its usefulness by including a compressed air lifting jack with the regular equipment. The small air compressor which is incorporated in the engine gives a continuous supply of air at 300 pounds per square inch pressure. This is used directly for turning over the motor and for inflating tires, while the use of the air jack considerably facilitates the making of replacements.

GRAND PRIX WAS EASY FOR HEMERY

Driving an Italian Car He Won French "Revival" in Hollow Style—Fatal Accident to Maurice Fournier.

Perhaps it was lucky for the Automobile Club de Sarthe, the promoter of the French Grand Prix, run over the Sarthe circuit on Sunday last, 23d inst., that no American cars took part in it, for, judging by the speed and endurance shown by the Marmon, National, Pope-Hartford, Alco, and other representative American productions, the Continental cars would have cut but a sorry figure. For in this year's famous classic the winner's speed averaged barely 57 miles per hour, which compared with the velocity attained at the Vanderbilt, American Grand Prize and Fairmount Park road races is slow traveling; and this despite the acknowledged perfection of the French roads. Victor Hemery, one of the foremost drivers of the world, romped home a winner in his 120 horsepower Fiat in 7 hours and 6 minutes, and was the only entrant to finish the 405 miles within the allotted time.

On the Sunday night preceding the race a deplorable accident caused the withdrawal of the Ford, the only American entry. In going over the course, Depasse, the driver, essayed to take one of the turns at a 75-miles-an-hour clip, but his car skidded and crashed full speed into a telegraph pole, catapulting driver and mechanic through the air with terrific force. Depasse escaped with a broken rib and contusions, but his mechanic, H. Esnault, was killed instantly. The car was wrecked beyond possibility of repair. The withdrawal of the Ford entry narrowed the international field down to the representatives of France, Germany, Italy and Belgium.

An innovation was made in marking the cars so as to give the spectators immediate knowledge of the nationality of any passing contestant. French cars were painted blue, German cars white, Italian green and Belgian yellow. Fourteen cars lined up for the start:

Car.	Nationality.	Driver.
Rol.-Pilain	French	Rigal
Rol.-Pilain	French	Gabriel
Corre	French	Fournier
Cote	French	Ollier
Cote	French	Leduc
Gregoire	French	Porporato
Excelsior	Belgian	Riviere
Excelsior	Belgian	Enlow
Porthos	German	Antony
Koechlin	German	
Mathis	German	Mathis
Fiat	Italian	Hemery
Bugatti	Italian	
Bugatti	Italian	Friedrich

The Fiat which Hemery drove to victory was the same machine which took part in the Savannah Grand Prize race of last year, and it proved so far superior to the rest of

the entrants that its driver did not have to push it to its limit to make a runaway race of it. French papers in commenting upon the eleventh hour entry of the big Fiat, openly express the belief that the Italian makers shrewdly waited until the last moment, when assured that no Marmon "Wasp," or Blitzen Benz, or Alco was to be included in the field. Frenchmen maintain that the Fiat was out to win the "resurrected" Grand Prix, and if there was to be any doubt about it, it would have stayed out rather than suffer defeat.

The race itself was full of thrills, even though it early became evident that there was nothing to it but the Fiat—as far as the winner was concerned. But the battle for second place waged hot and furious for several hours. After more than half of the distance had been covered, the Fiat pulled out for adjustment to its machinery, which kept it out so long that Maurice Fournier, who was driving a car of his own design and manufacture, which he called "Corre de Course," managed to pull up on even terms. As soon as Hemery came back on the track, however, he gave the Fiat its head and fairly flew after the ambitious Fournier. The latter in trying to keep his slight advantage subjected his car to too great a strain, and shortly after the Italian had managed to pass in a cloud of dust, the axle of Fournier's mount collapsed and the driver was crushed to death beneath it. The mechanic was hurled a hundred feet and seriously injured. Hemery never knew of the fatal accident until he stopped for a tire change on the next lap.

The tropical heat which obtained during the race was extremely "hard" on tires and an unusual number of stops had to be made on this account. The winner's car was shod with Michelins.

Nebraska Jury Gives Woman One Cent.

One cent damages was the sum awarded by a jury to Mrs. Anna Hoerr, of Wymore, Neb., against the Wheaton Automobile Co., for the alleged retention of an automobile belonging to the plaintiff in the garage of the defendant. Included in the suit was the sheriff of the county. The case was a most unusual one. Mrs. Hoerr claimed that the automobile was seized by the sheriff, although it was owned by her, and that the sheriff told her she would be deprived of its use, because her husband, who had been convicted of a robbery, had placed it at the disposal of bank robbers with whom he was acquainted. Someone recognized the robbers' car as that owned by Mrs. Hoerr and temporary confiscation by the county authorities followed. She therefore considered herself damaged to the extent of \$500 by being denied its use for the time during which her husband was in jail awaiting trial on the complicity charge. When he was sentenced to the penitentiary the car was turned over to her, but she was not satisfied and instituted a law suit for damages.

MUD FAILS TO AFFECT 14 SCORES

Only Two Heavy Penalizations Inflicted in Ohio Contest and but Three Failures—One Rather Amusing Arrest.

Fourteen of the thirty-three starters in the Wheeling-Columbus-Cleveland three days' reliability run conducted last week by the Cleveland News, completed the 533 miles with perfect scores. The contest, which ended Wednesday night, 19th inst., was the most successful ever held in Ohio and surpassed in every respect a similar event held by the same publication last year.

In the entire route there was not a single stretch of level road that measured more than a half a mile in length. The greater part was up one hill and down another. These hills are broken at short distances by water breakers that rise a foot above the road level. This makes an excellent test for springs and adjustments but does not contribute to easy going. The famous St. Clair's Hill, just outside of Wheeling, winds up the side of a mountain for a distance of a mile and a half, and was the longest climb of the route.

As the Motor World stated last week, the first day of the run, due to a twenty-hour downpour of rain, was largely a mud plug. As the result three contestants retired at Wheeling, W. Va. These were C. H. Tyler, driving a Columbia, who broke a spring; B. Sampson (Krit), who suffered more than one man's share of tire trouble, and J. T. Ruffel (Norwalk), who stripped a gear.

There were only two accidents on the whole run and they were not serious. T. S. Hammer, who drove a Peerless roadster, turned his car into a ditch near Sullivan, Ohio, in order to avoid running into a hay wagon that had turned the wrong way as Hammer attempted to pass. As the car struck the ditch, the steering wheel hit Hammer's arm and tore three ligaments. A local physician attended Hammer's injuries. As a result of the shock to the car, adjustments had to be made to the steering gear, ignition and fan, for which a penalty of 15 points was imposed.

The other mishap occurred when B. Sampson in a Brush car ran over "Tony" Grimes, the A. A. A. representative in Zanesville. Grimes slipped in the street and before the car could be stopped it ran over his chest. With the exception of a bruise on the arm Grimes was uninjured. No penalty was imposed for the accident, but Sampson had to do a little work on the spark plugs and lost two points.

The most excitement befell D. W. Iseminger, driving a Velie and Harry Zautner, the observer, who were arrested in Mansfield, Ohio, following a short altercation with two policemen. The law officers misunderstood the motorists when they en-

deavored to explain why it was necessary to stand in a certain place until they could be checked in, but both men were immediately released by the Director of Public Safety as soon as the situation was explained. Iseminger made the trip with a perfect score but his partner, Harry L. Vance, had to replace a part in the Velie car he drove and lost two points.

Those finishing and their scores, which were announced on Saturday last, were as follows:

Perfect—Dan W. Iseminger, Velie; C. G. Bledsdale, Maxwell; Fred Krum, Oakland; Harry Kortz, Firestone-Columbus; F. B. Smith, Buick; G. P. Sperry, Regal; J. H. Greenwald, Marmon; J. Bauer, Oakland; F. Metzger, Everitt; F. Krif, Krit; J. Adrian, Lion; J. P. Norwalk, Norwalk; F. E. Van Patten, Ford; A. G. Bredbeck, Reo.

Lost two points—Harry L. Vance (Velie), replacing crank; B. Sampson (Brush), work on spark plug.

Lost three points—E. C. Lucas (Mitchell), water out of control; J. W. Robertson (Maxwell), repairing wire on cut-out.

Lost six points—C. D. Paxon (Jackson), cleaning spark plug and tightening clutch.

Lost 12 points—M. Keiser (Bergdoll), repairing springs; V. R. Hall (Cartercar), engine stopped twelve minutes.

Lost 15 points—T. S. Hammer (Peerless), work on steering gear, ignition and fan.

Lost 17 points—L. B. Moore (Regal), adjusting carburetter and taking water.

Lost 120 points—J. F. Moore (Ford), broken fan blade and radiator leak.

Lost 663 points—H. W. Orendorf (De Tamble), work on gears and transmission.

Non-contestants who made the trip were: Ira Fouche (Garford); E. B. Finch (Chalmers); Andy Auble (Oldsmobile); Mrs. Fred Wood (Oldsmobile), and Charles Ross (Liberty-Brush).

Investigating Illinois's "Justice Mills."

Closely following the disclosures in the case of the "justice mill" said to have been operated by Fred Beisswanger, a justice of the peace at Niles, near Chicago, announcement has been made by the state's attorney of Illinois that a rigid investigation is under way, with a view of determining just what becomes of the great number of fines collected by the various lower courts and magistrates, a certain percentage of which is supposed to be turned over to the good roads fund. It is claimed that there exists a great discrepancy in the amounts turned over, and the fines known to have been collected from motorists.

For several weeks the Chicago Automobile Club quietly has been collecting evidence of all fines inflicted upon its members and a number of discrepancies already have been discovered which put several justices under suspicion. The evidence has been turned over to Judge C. A. McDonald, who passed it along to the state's attorney.

VACATION WITH GUNS AND WIRELESS

Illinois Cadets Bring Their Motoring Artillery to New York—Enlarged Features of an Annual Outing.

Those industrious cadets of the Northwestern Military Academy, of Evanston, Ill., who every year go on a long automobile "vacation," during which they test various novelties in the line of offensive and defensive weapons or tactics, on Tuesday last, 25th inst., rolled into New York, equipped from top to bottom with all the

more, Philadelphia, New York, West Point, Albany, Buffalo, and back along the lake shore to Chicago. At Washington they were asked to demonstrate their ability as wireless operators and airship destroyers, and later on they will give a sample of their proficiency at the maneuvers of the Army Signal Corps at Omaha, Neb. Major R. P. Davidson is in command, with Captain Broome, of the Illinois National Guard, and Lieutenant F. L. Beals, of the United States Army, assistant officers.

Bar Harbor Now Wants the Motorists.

"We cut off our noses to spite our faces"—is the candid admission made by the peo-

NORTHWESTERN MILITARY ACADEMY AUTOMOBILE FIELD WIRELESS OUTFIT

paraphernalia for fighting aeroplanes and balloons, with wireless apparatus carried on collapsible steel masts, and painted a business-like "battleship gray" which made them look real formidable. They numbered three officers and thirteen cadets, which total divided into four cars, allowed four passengers to each car.

No automobile manufacturer ever dreamed of putting so much "equipment" into his touring cars as the soldier boys have managed to squeeze into them; and that apparently without overloading the cars. Each of the fighting units carried a dangerous-looking Colt automatic gun, capable of being directed to almost any point of the sky; ammunition to go through a hot engagement, and finally a collapsible steel mast for the wireless apparatus, which was fixed up immediately behind the driver's seat. Added to this war outfit there was the regular baggage of the sixteen participants, and it will be easily seen that the cars had to carry a considerable load.

The cadets left Chicago on July 6, going through Indiana, Ohio, West Virginia, Washington (D. C.), to Annapolis, Balti-

ple of Bar Harbor, who two years ago could not heap enough abuse on the automobile, and finally succeeded in barring their roads to motorists. Thereby they not only excluded many transient tourists but curtailed the activities of numerous local cottagers who own cars. Not only has the number of "summer boarders" fallen off alarmingly in the Bar Harbor district, but even the well-to-do who were unlucky enough to have summer homes in the hostile territory gave it a wide berth, with the result that merchants of all trades are setting up a tremendous howl, because the income from the regular winter trade is not sufficient to make their stores pay them a living income. The tourist and the summer boarder are needed in Bar Harbor, and because the hostile automobile legislation deprives them of the use of the motor car they go somewhere else. Reports from the Maine coast state that the same people who were so violently opposed to automobiles two years ago, now are eager to admit them, and that a bill will be introduced in the next legislature to abolish the "exclusion" policy.

AMATEURS DOWN THE TRADE TEAM

Chicago Contest in Which "Pures" and "Pros" Mingled and Which "Pures" Won—Sports on Michigan Soil.

In Chicago, where interesting team competitions have become popular during the past year, the Chicago Motor Club promoted a contest of the sort between amateur and trade teams composed of club members, although the rules of the A. A. A. forbid competition between amateurs and professionals—and all tradesmen are pros according to the A. A. A.'s lovely rule—even David Beecroft, a member of the A. A. A. contest board, violated the rule in the contest, which occurred July 20-21. It was a reliability affair, with St. Joseph, Mich., 105 miles distant, as the destination. The return route covered 117 miles and the amateurs won by a score of 221 to 287.876 penalizations.

The rules imposed penalties for work done and being late at controls. The first day's trip was remarkable for the slowing made by the amateurs, as they lost only one point—C. K. Anderson, in a Mitchell, killed his motor—while the trade team was assessed 263 points—Charles Van Sicklen, William Roesch, W. D. Ferguson and Harry Cooper were penalized for motor stops, Webb Jay for gasoline trouble, Tracy Holmes broke a crank shaft and Harry Watts made steering gear adjustments. Holmes could not replace the shaft and withdrew.

On the return more perfect scores were eliminated, the amateurs suffering the most. C. G. Sinsabaugh, Abbott-Detroit, had ignition trouble and failed to get away from St. Joseph, for which he lost 150 points; H. H. Van Sicklen, Sr., Apperson, was penalized one point on account of driving chain trouble; Claude Anderson, Mitchell, was assessed 67 points for work done, while G. W. Gaidzik, Premier, and T. F. Laramie, National, each lost one point for motor stops. C. F. Van Sicklen of the trade team changed a spark plug in his Ford and lost one point; C. E. Gregory, Chalmers, had a motor stop and broke his perfect score; H. C. Watts did work and was arrested for scorching. He lost 65 points. Tracy Holmes, Corbin, withdrew.

The trade team had sixteen drivers and the amateurs fourteen, therefore the dealers were only penalized 14/16 of a point instead of a full point. This drew a fine finish because it looked for a time that Claude Anderson would have to withdraw his Empire, thereby crippling the amateurs. Eight of each team finished with perfect scores, as follows:

Fractional penalization, 287.876 points.	

In the field sports at St. Joseph the Van Sicklen ball team defeated the Woods nine by a score of 8 to 2. Harry Watts won the 100-yard sprint and George Gaidzik, former national fancy diving champion, a member of the amateur team, carried off the honors in the water events.

York's Unsanctioned Meet Draws Fire.

All those who had to do with the unsanctioned racemeet at the County Fair Grounds track, York, Pa., on July 4, have been disciplined by the American Automobile Association. The track itself has been disqualified and rendered ineligible, as have been four drivers, H. Heiges, P. P. Anderson, C. Lambright and Thomas Wilkie. The promoter, the York Automobile Association, and the official starter, H. R. Hardesty, have been disqualified and suspended until January 1, 1912, together with the following entrants: York Garage & Supply Co., J. P. Oden Automobile Co., W. P. Norris, J. W. Richley and J. Y. Burgard, and the drivers of their cars, N. F. Hench, W. F. Grove, E. T. Gilliard, N. R. Gilliard, C. Summers, R. Little, Bob Yeager and J. P. Oden.

Two Clubs Elect Officers.

The Automobile Club of Corydon is the style of an organization formed last week in Corydon, Ind. The officers are: President, W. H. Keller; vice-president, W. E. Cook; secretary and treasurer, W. Bulleit.

The Boonville Automobile Club, of Boonville, N. Y., has elected the following officers for the ensuing year: President, B. A. Capron; vice-president, J. M. Hobart; secretary, C. R. Sperry; treasurer, Rev. F. C. S. Smith.

GERMANS EXTENDED THE GLAD HAND

Remarkable Enthusiasm Aroused by the Prince Henry Sportsmen's Tour—Scores Spoiled and Interesting Happenings.

That the Prince Henry Tour of 1911 was not quite the pleasure trip which English motorists had been led to expect, but comprised a good deal of hard driving over steep hills and sandy roads, is the gist of mail reports received here during the past few days. The first day of the tour, July 5, particularly was replete with surprises of this kind, as four hours after the start from Homburg some of the cars were in trouble. One of the big English cars burst its radiator, and while temporary repairs at once were made, it lost a good many points for taking on water, until proper repairs were made in Southampton, with a commensurate loss of marks. Another English car broke an exhaust valve, while, to offset these British troubles a German car, owned and driven by De la Croix, ran into a wagon and had to be withdrawn, causing a daily loss of 50 marks to the Kaiserlicher Automobile Club.

Thirty-eight German and thirty English cars reached the top of the Grosser Feldberg, a mountain rising 2,200 feet above the surrounding country, and here the visitors were given their first taste of German hospitality. The whole populace was out. The roadsides were fairly lined with humanity, and the cheering and flag waving were almost continuous. Flags flew from nearly every house, and bouquets of flowers were showered into the cars, sometimes striking the occupants in the face and inflicting painful scratches.

"It was absolutely inspiring," writes one of the Englishmen on the tour. "It was a nation's welcome; heartfelt, generous and spontaneous. One had only to look at the beaming excited faces, the tense forms and the sudden outshoot of the right arm upward in a sharp salute, to realize that the vim and energy of this great and mighty nation was finding expression in one great and spontaneous welcome. The tour has proved an eye-opener to us Englishmen. Most of my preconceived ideas about Germany and the Germans have been wholly changed. I imagined in my ignorance that they were a phlegmatic people, hostile to the British and heavy and uninteresting in appearance. Instead we received a welcome that was beyond description. . . ." And not the least interesting part of the trip was to see Prince Henry perform his mechanical duties, ply monkey wrenches, etc., to conform with the rules of the contest, which barred tradesmen and professional chauffeurs from even handling the cars. It was the strictest amateur sportsmen's contest ever held, and no manufac-

turer or person connected with the trade will be permitted to use the contest as an advertising dodge.

On the second day, July 6, accidents were few and far between; the only serious one happening to a German car which was traveling over a bad stretch of road at a speed of at least fifty miles an hour. It ran into a farm wagon and broke its axle. A French car, driven by Capt. Kennedy as a member of the British team, broke its camshaft, because the central pin had been forgotten at the last control; it lost one day, equal to 50 marks. Mr. Michael Orde, who drove Sir Griffith's car, had trouble with seized pistons and lost 3 marks. Oliver H. Valpy had a broken spark plug, and G. F. Sharp lost two hours on account of a broken magneto chain. A. E. Berriman was run into by a non-competing car and had his gasoline tank torn off the foot-board and his oil tank damaged; he did not lose any marks, as it was through no fault of his that the accident occurred.

The last day on German territory, July 7, was enlivened by an unusual and ludicrous accident. E. Manville, who drove the Duke of Connaught's limousine, was overcome by the heat and fell sound asleep—with the natural result that at the next turn his heavy car ran off the road, cut down a small tree and brought up in a cornfield on the other side of a ditch. Neither car nor driver were injured, and not even the engine was stopped, so that no loss in points was marked against the Duke.

At the port of Bremerhaven some of the cars lost the greater part of their oil supply in an odd manner. When the big ship's cranes started to lift the cars to the deck of the steamer, each car tilted forward at an angle of about forty-five degrees, which caused the oil to run out of the reservoirs. But both the loading of the 68 cars at Bremerhaven and the unloading at Southampton were accomplished without a hitch or accident.

The first day on English soil, July 10, was replete with humorous incidents. Arrived at the Randolph Hotel, Oxford, at noon, the hotel people were taken unprepared and there were no waiters ready to serve the tourists. As a result the other guests of the hotel were treated to the unusual sight of an imperial prince, brother of the Kaiser, running along the corridor with a plate of soup in one hand and half a dozen sandwiches in the other. It was a case of "first come, first grab," and the prince was in no way backward about grabbing.

Joy riding of the Central Park kind was the effort of the second day on English territory, July 11, on the stretch from Leamington to Harrogate. Nothing of an exciting or unusual nature occurred on this part of the route, tire trouble being the most serious accident recorded. The roads were smooth, well shaded with trees and the reception accorded the tourists was the most cordial possible.

Up to this time the English appeared to have less points charged against them than the German, and the "friendly competition" waxed keener as the days passed; for although the actual number of points charged against the Germans was greater, the percent system of calculation still showed a slight advantage on the German side. The 450 points marked against the K. A. C. on account of the withdrawal of the De la Croix entry, after the accident on the first day, was the greatest debit on the German side of the record book, and the Englishmen appeared confident that it would prove the deciding factor in the awarding of the prizes. Besides the cup donated by Prince Henry, there are cups given by King Edward, the Kaiser and Queen Mary, of England.

Changing Rule of Road in Germany.

Claiming that the present custom of passing vehicles traveling in the same direction on the left side, while keeping to the right side of the road in the case of vehicles approaching in the opposite direction, is puzzling and objectionable, the governments of several of the central German states have under consideration a bill, requiring that every fast-moving vehicle on the public roads or streets must keep to the right under any and all circumstances; that a slow moving vehicle shall be compelled to keep as near to the left side of the road as it is possible for it to go, provided no vehicle is approaching in the opposite direction, and that automobiles, in particular, always shall travel along the right hand side of the road, when going at speed. As these regulations are opposed to present custom, many accidents are likely to happen, until the farmers and peasants of the outlying districts learn of the new rules and follow them. The rules have been passed upon favorably by the respective committees on ways and roads, and there is little doubt of their being enacted into law.

Lewis Strang Meets Death on Road.

After having looked death in the eye more than once while his car traveled at a mile-a-minute pace, or even faster, it was Lewis Strang's fate to be killed in an easy-going endurance contest, in an ordinary touring car filled with passengers, while going along a country road at not more than about 25 miles an hour. The accident happened on Thursday last, 20th inst., during the Wisconsin State Automobile Association's endurance run, on a rough piece of road a mile east of Bluff River. A farmer's wagon traveling in the same direction as the automobile, caused Strang to turn his car to one side of the road, and it went over the steep embankment, crushing him beneath its weight. The two other occupants of the car saved themselves by jumping.

Lewis Strang first became famous as the driver of one of Walter Christy's freak racing machines, and ever since had en-

joyed the reputation of being a fearless, daring driver. He held many records on road and track, having won the Savannah road race of 1908, the Briarcliff Trophy, the 24-hours race at Brighton Beach, the Lowell (Mass.) road race (all in the same year); the Ormond Beach 100 miles race (1909), and other big events. He joined the Barney Oldfield "troupe" and took part in many races at country fairs; became a member of the Buick racing team, with Burman and Chevrolet, and, finally, as star and manager of the Case racing team, he competed in the International Sweepstakes on Memorial Day, at the Indianapolis speedway.

When the Wisconsin Automobile Association started its endurance run, Strang was chosen to drive the pilot car, a Case; with him at the time of the accident was Joseph Jagersberger, his racing team mate. Strang was a native of New York, and 26 years of age. About two years ago he somewhat romantically married an actress, who survives him.

A. C. A. Issues 876 Pages of Tours.

The new Tour Book of the Automobile Club of America, which has just been issued and which now is on sale to the general public, has been published on a loose leaf system with flexible morocco leather cover. The latter is designed to last for an indefinite period, whereas the contents may be changed and added to from time to time as new or corrected routes are compiled by the Bureau of Tours.

The book contains 22 sectional pages, 20 of which are printed on double pages and two on four pages. On the backs of the sectional maps are 125 city maps, showing tourists how to pass through the principal places encountered on the main traveled trunk lines.

In addition to the 900 odd routes giving full running directions in all parts of the country, the volume contains a description of Canadian customs regulations and licenses; customs regulations of the United States and all foreign countries; ferry information and timetables; foreign touring information; lists of hotels and garages; information in regard to automobile insurance; a summary of state motor laws; a complete index of all cities and towns through which the routes pass, totaling some 4,500 names; an index of city maps; an index of routes, etc.

Practically all that is contained in the four volumes of the public motoring guides of the United States is embraced in the 876 pages of the Club Tour Book.

Colby Organizing a Racing Team.

The Colby Motor Co., of Mason City, Iowa, is "going into" racing. It already has engaged W. F. Pearce, who drove one of the Fal racing cars, to manage the Colby team which is being organized and which will participate in practically all of the year's more notable events.

KISSEL INVENTS A NEW STYLE

Semi-Touring Body All that Its Name Implies—A Fourth Model Added to Complete the Line.

In designing its new models the Kissel Motor Car Co., of Hartford, Wis., has evolved at once a new style body and a new name for it. The designation, which is novel, is that of the semi-touring car, and the style itself may be described as a combination of the advantages of both touring and small tonneau types. The semi-

sible and it retains the characteristics that were present in the last series of cars produced. In order, the prices are \$1,500, \$1,850, \$2,350 and \$3,000. The 50 and 60 horsepower models, therefore, have been advanced \$350 and \$500, respectively.

The 40 horsepower chassis is a new one, having been introduced to complete the line. It has the same cylinder dimensions as the six-cylinder machine, that is to say, $4\frac{1}{2} \times 4\frac{3}{4}$ inches, bore and stroke, 118-inch wheel base and a three-speed change gear. It is mounted on $35 \times 4\frac{1}{2}$ -inch tires and is equipped with either semi-touring car or semi-racing bodies.

Speaking of the general design of the

and, particularly, in the full touring models, serves to eliminate a certain suggestion of "chunkiness" that otherwise might be present. The semi-racer type, so-called, it as attractive runabout, built with rakish steering column, well hooded dash, moderately high sides and a novel fuel tank in the rear, back of which is the spare tire carrier.

The standard equipment which applies to all models except the 30, includes mohair or pantasote top and cover, windshield, gas lamps, Prest-O-Lite tank, shock absorbers, front and rear, demountable rims, speedometer, tire carrier, oil dash and tail lamps, robe and foot rails, horn, jack, pump and

THE KISSEL 30 HORSEPOWER SEMI-RACER

THE NEW 40 HORSEPOWER SEMI-TOURING MODEL

touring type of body, which is applied to the entire line, carrying out the idea of uniformity in a variety of sizes, is not a small tonneau affair, however, being rather a light and convenient touring car of closed-front construction, designed to carry five passengers and having the snug qualities of the torpedo with the cowl dash of that type, as well as the comfortable seating of the full-fledged touring model. The latter, by way of contrast, is a little larger, a little more roomy, a little higher in the

series, but few alterations have been made. They include a redraughting of the frame lines, in order to afford an inward curve in front, whereby the turning lock is materially increased and, correspondingly, the handiness of the car when maneuvering in close quarters. A so-called Mercedes type of radiator has been adopted, the wheel hubs and bearings have been enlarged and the rear axle design has been changed to afford a tapered effect.

The body designs are uniformly of the

tools. The model 30 is not regularly equipped with either windshield, shock absorbers, demountable rims, speedometer, tire carrier or tonneau rails. Otherwise it has the same equipment as the larger cars.

Mechanically the design is thoroughly modern, embracing such features that are approved by general adoption as dual ignition, self-contained automatic oiler, semi- and three-quarter elliptic suspension, Timken roller bearing mountings throughout, except in the change gears, where F & S

THE 50 HORSEPOWER IN SEMI-TOURING FORM

THE 60 HORSEPOWER SIX-CYLINDER TOURING CAR

seat backs, and a little more luxurious and impressive in appearance.

The Kissel line, as just announced, consists of four chassis, namely a 30, a 40, a 50 and a 60, the numerals, of course, indicating both the type and the horsepower. As heretofore, the largest model is of six-cylinder construction, the others being equipped with four-cylinder motors. The general design and construction is the same throughout all models, as nearly as is pos-

sible and it retains the characteristics that were present in the last series of cars produced. The straight line effect is carried out in the top rail of the tonneau, the front doors and the upper line of the hood, but is broken up to some extent, by the fine moldings and paneling at the tops of the doors. The rear guards are shaped over the wheels with a straight projection in the extreme rear, while the front members are given a long slope, which adds a rakish effect to the vehicle,

annular ball equipment is used. Three-speed change gears are employed on the 30 and 40 horsepower models and four speed gear sets on the 50 and 60.

To complete the line each of the four models is listed in coupe form, while the 40, 50 and 60 models also may be had with limousine mounting. The enclosed cars are of staple design and thoroughly outfitted, their prices ranging from \$2,100 to \$4,200. An unusual and most attractive feature of

the offering, however, is the fact that the price quotations uniformly include the touring body, which is interchangeable with the limousine. The line of commercial cars produced includes 1½-2, two, three, four and five-ton trucks, as well as omnibuses, ambulances and fire apparatus.

Growth of Motor Cars in Japan.

Automobiles are rapidly becoming popular in Japan, says the Japan Weekly Mail, and bid fair to command a large demand among all classes of people. There were only a small number of cars in use in Tokyo up to last autumn, but they have since shown a great increase, so that about 160 automobiles are now registered in that city, or double the number registered towards the end of last year. An increase in the demand is also discernible in other towns. Yokohama has about 40 cars, Osaka 20, Kyoto 10, and Kobe 15 or 16. The use of motor vehicles for transportation of goods and other business purposes has not yet made any development, although there exists in Tokyo the Imperial Automobile Transport Co., which possesses 12 machines. Owing to a mistake in their original plan, however, only one automobile is fit for use, and this is chartered by the Department of Communications for the transportation of mail matter. The Naikoku Tsuun Kaisha has under consideration a scheme for the motor transportation of goods, and has recently placed an order for 10 vehicles. In provincial towns motor vehicles are gradually replacing omnibuses, and proposals are on foot in various places, especially in Echigo, Shinano, and Sanuki provinces, where the use of automobiles for the conveyance of passengers has shown a satisfactory result.

Unusual Test of a Fire Engine.

What is probably the most extraordinary trip ever made by a motor-driven fire engine was accomplished in Germany last month. One of the new monster gasoline engines contracted for by the fire department of the city of Berlin was sent on a forced run, under actual service conditions, from Berlin to Magdeburg and return, a total distance of 312 kilometers, or 195 miles, which run was accomplished in the remarkable running time of 9½ hours, using 24½ gallons of gasoline.

Immediately on arrival in Magdeburg the engine was rushed through the city to the fire-testing houses and there put through a rigid pumping test, in which the engine worked faultlessly. Half an hour was spent in pumping and then the return trip was started. On the return journey the apparatus attained a speed of 45 kilometers an hour, when forced to the limit. The engine arrived in Berlin in excellent condition, ready to go to a genuine fire at a moment's notice. One of the peculiarities of the new engine is the tire equipment, which consists of heavy tubes filled with an elastic material made of raw caoutchouc.

NEW MAXWELL MODELS ARE OUT

**Large Touring Car a Low-Priced Leader—
Outward Changes Alter Appearance—
Structural Essentials Preserved.**

Hereafter Maxwell models will be known by name, instead of by number, it being explained that while the numerical system of designation satisfies the requirements of shop practice well enough, it is apt to be confusing to the individual motorist, to whom it is barren of meaning. Therefore, the forthcoming line, which the Maxwell-Briscoe Motor Co., of Tarrytown, N. Y., just has announced, will consist of the "Special," "Mercury," "Mascotte" and "Messenger." The Special is a brand new model which is hailed as being most extraordinary, since it is a 36 horsepower touring

combination of royal green, with Wedgewood green wheels.

The new car will employ a new long-stroke motor, the cylinder dimensions of which will be 4¼ x 5¼ inches, bore and stroke; the four-cylinder style of construction and thermo-syphon method of circulating the cooling water naturally being retained, as is the dual ignition system with Splitdorf magneto and the force-feed oiling system. Multiple disk clutch, sliding gearset, full-floating rear axle, 34 x 4-inch tires and 114-inch wheel base, are other of its features. As the picture shows, it is a well-set product, clean lined and in good proportion, looking quite unlike the standard type of Maxwell that has become familiar, owing principally to the change in the form of hood and the absence of the brass band surrounding the radiator which has been inherent to the type of cooler hitherto employed.

The Mercury model is a "mile-a-minute"

MAXWELL SPECIAL, A NEW 36 HORSEPOWER TOURING MODEL

car, complete in every respect, and listed at the striking figure of \$1,280.

In a general way, the features that have characterized the Maxwell line in the past have been retained. The unit type of power plant, multiple disk clutch, sliding gearset, shaft drive and magnetic ignition are considered useful fixtures in the annual specification sheet. In enhancing the value of the renewed line, however, and by reason of the wide scope of the purchasing and manufacturing departments of the great United States Motor Co., of which the Maxwell company is an element, it has been found possible to make several changes affecting the appearance of the product. Thus the shape of the hood and the style of radiator have been changed to that long familiar in connection with the Columbia cars, also a U. S. Motor company product, the new style closed-front bodies have ventilated front doors and are of approved and pleasing design, while the finish has been considerably altered in appearance by the adoption of a new color scheme which, in the case of the Special, is a com-

roadster, listing at \$1,150, likewise equipped with a closed-front body of the new design and further distinguished by a special racing type of magneto as standard equipment and demountable rims. The Mascotte is a 25 horsepower car listing at \$980 in touring form and \$950 as a roadster. It is a continuation of the former model I, having a 4 x 4-inch motor, closed-front body with inside control levers—a new feature of the entire line, by the way, the Columbia style of radiator and hood, and what is designated as the Stoddard-Dayton type of spark and throttle control. The Maxwell Messenger, is disclosed as the 16 horsepower two-cylinder runabout, which is an established member of the line, and which will be continued with sundry refinements.

Motorizing South Bend Fire Department.

South Bend, Ind., has decided to wholly supplant its horse-drawn fire fighting apparatus with automobile apparatus. The purchase of the first machine, a \$7,000 chemical wagon, has been authorized, and the others will be bought as rapidly as possible.

FIRST IDEAL PRODUCT IS READY

New Stutz Car Built in Three Styles on One Chassis—Solid Design Embodies Well-Tried Features.

Making its bow to the public under unusually auspicious circumstances, the new Stutz car, which was a contender in the International Sweepstakes at Indianapolis, on May 30 last, finishing in eleventh place,

4¾ x 5½ inches, bore and stroke, and are cast in pairs and offset ¾ inch from the axis of the crank shaft. The cylinders and valve passages are entirely water jacketed, circulation being maintained by means of a gear pump. The pistons, which are provided with four packing rings and as many oil grooves, are tapered from top to bottom, the upper end being three thousandths below size in order to allow for expansion in service. A geared pump forces the lubricating oil through copper oil leads to

changes of speed, one of its features being the arrangement of the shifting rods parallel to the torsion tube, which houses the propeller shaft, with the intent of providing against the possibility of the gears being thrown out of mesh as a result of spring action. The transmission and differential housing is a rigid unit casting and the trussed construction of the axle assemblage is calculated to give it great strength and rigidity.

The clutch is of the multiple disc type,

CHASSIS OF THE NEW STUTZ CAR, SIDE AND END ELEVATIONS

now has attained marketable proportions and its details have been announced for the first time. The Ideal Motor Car Co., of Indianapolis, its manufacturer, is a relatively new organization and the car which figured in the great race was its first product.

In general construction the chassis is of what may be termed standard proportions, although the actual dimensions indicate that it is not without originality. With a single chassis, which is illustrated by the accompanying picture, three styles of vehi-

cles are to be produced, namely, a two-passenger, a four-passenger and a five-passenger. Each of the models will sell for \$2,000. The car is low-hung, with a road clearance of ten inches, has 120-inch wheel base and is equipped with 34 x 4¾ inch tires front and rear.

A T-head four-cylinder motor is installed in the chassis, the cylinders of which are

the main shaft bearings and thence, through internal ducts in the shaft to the connecting rods. Large crank and cam shafts, the latter being removable through the end of the crank case, liberally proportioned bearings, 2½-inch valves and Eisemann dual ignition are other of its features. The ignition system includes in addition to the magneto a separate breaker box for use when the battery is employed, thus obviating the possibility of pitting the magneto contact points. The non-vibrating coil and switch

running steel to steel, and is equipped with a small brake to prevent the spinning of the shaft while changing gears, as well as a double universal joint, to guard against possible warping of the shaft while running over rough roads.

The steering gear is of Gemmer pattern, affording a powerful differential screw action. It has an 18-inch hand wheel with engine control quadrant mounted above.

Twin internal expanding brakes are mounted on the rear axle, the drums being of 14-inch diameter and 4½-inch face. The

SHOWING MOTOR AND AXLE DETAILS OF THE NEW STUTZ CHASSIS

and the starting push-button are mounted on the dash. The change gear unit is combined with the rear axle according to a system which has been in use on other products for the last four years and which bears the name of the inventor, as does the new car, of which he is the designer. The gearset is of the selective order, affording three forward

front axle is of improved Timken design. The rear axle and transmission shafts are carried on annular ball bearings. Semi-elliptic springs of good length are used, mounted with double shackles and the Mercedes type of non-reversible rear loop. The frame is made with a 2½-inch "kick-up" in the rear to ensure ample clearance for the axle.

USES POWER TO DUMP ITS LOAD

Gramm Develops an Ingenious Unloading Device for Trucks—Arranged to be Operated from Driver's Seat.

Illustrating how the power plant of the motor truck may be employed for auxiliary purposes, thereby increasing the utility of the vehicle as a whole, the Gramm Motor Car Co., Lima, O., just has produced a new type of mechanical dumping body, in which it is possible not only to perform the unloading operation in far better time than is possible where the ordinary hand-actuated dumping means is used, but which is so

tion and the method of its connection, it is possible for the driver to dump a load without leaving his seat, the time saved in a continuous haulage operation on this very account being a not inconsiderable item in the contractor's favor. The device is simple in construction and not likely to become deranged through rough handling.

The chassis on which the new body equipment has been installed, as the picture shows, is one of the six-ton chassis equipped with a 50-horsepower motor. The body has a capacity of 124 cubic feet, and the winch which actuates the dumping mechanism can be operated to raise the body to its full height in 40 seconds. In a test of the new vehicle seven tons of crushed stone were hauled over "give and

TWO SPARKS FOR MARMON ENGINE

Ignition System Developed in Racing is Made a Stock Feature—Few Other Changes Found Necessary.

Following its two years and more of careful experiment in the fire test of the racetrack, the Nordyke & Marmon Co., of Indianapolis, Ind., has announced its intention of equipping its cars regularly with two-point ignition. In the new series Marmon Thirty-Two, the details of which have just been revealed, two sets of spark plugs will be used simultaneously, one set being mounted over the inlet valves and the other over the exhausts, as with the ordinary double ignition system. The use of two sparks at once, ensuring, as it does, more rapid inflammation of the charge than is possible where only a single plug is employed causes the engine to develop slightly more power and more reliable operation than before, although otherwise practically unchanged. As both batteries and magneto may be employed selectively, it follows that the full advantages of the dual system are obtained.

With this exception the construction of the car will be but little altered, which is saying a good deal for the merits of its design. It is now entering on its fourth year on the market, thus having been reproduced with few changes three successive times. What may be supposed to be equally important, its price, will not be changed, but will remain at \$2,750, whether for the five-passenger touring, the four-passenger suburban, so-called, or the two-passenger runabout. Limousine, landaulet and coupe models also will be produced.

Such alterations in construction as have been made, in addition to the change in ignition equipment, include an improvement and simplification in the clutch and brake pedal assembly, the adoption of ratchet controls for the spark and throttle levers, instead of the friction devices formerly employed, and the adoption of a differential gear that is made in the Marmon plant instead of being produced outside. The floating drive shafts of the neat rear axle construction, now are made with integral rather than riveted flanges, while the size of the brakes has been increased from 14 to 16 inches diameter. The front and rear wheels also have slightly heavier spokes. Even the body designs have been deemed worthy of reproduction, saving that the five passenger body now has an aluminum hood over the dash which is similar to that used on the four-passenger body.

In the matter of equipment, it is noteworthy that demountable rims are now a standard feature, while the tire sizes have been increased from 34 x 4½ inches to 35 x 4½.

SIX-TON GRAMM TRUCK WITH SPECIAL DUMPING BODY

constituted that the vehicle may be employed to spread its load over any required area, and in a layer of predetermined thickness. The machine has been produced for the Defrain Sand Co., a Philadelphia concern.

The body is of the tilting type, with a floor slope of fifteen degrees, when in the loading position. Under operation, the floor can be tipped until it assumes an angle of 40 degrees, the angular movement of the dumping operation thus amounting to 25 degrees. An automatic stop prevents the body from being raised beyond this point, thus preventing any ill effects as a result of careless operation. The end gate is automatically controlled, swinging open as the body is raised. According to its adjustment, it either opens sufficiently to allow the entire load to slide free of the body, or else remains at a fixed opening. In this case, only a limited amount of material can flow through the opening, as a result of which, a uniform layer is spread behind the vehicle as it is driven forward.

The dumping mechanism is a special arrangement which may be thrown into or out of action independently of the transmission. It is actuated by means of a side hand lever which is mounted along side the emergency brake lever. Owing to its loca-

take" country roads at the rate of ten miles an hour. At the end of the trip the stones were spread over the highway surface in a layer of even thickness and width.

McIntyre Brings Out a \$1,000 Model.

In keeping with the present tendency of the industry to offer the purchaser every possible inducement to invest, the W. H. McIntyre Co., Auburn, Ind., just has brought out a new \$1,000 model, designated D12, which is of the five-passenger closed-front touring type, and which will be ready for August delivery. The new car is driven by a four-cylinder 4½ x 4¾ motor of 35 horsepower nominal development, which has its cylinders cast in pairs and is equipped with large valves, long pistons, large bearing surfaces and other approved characteristics. Cone clutch, three-speed selective change gear, 114-inch wheel base, 34 x 3½-inch tires, magneto ignition and oil and gas lamp, generator, horn and tool equipment, are other of its specifications. The so-called special equipment, which is listed at \$125 extra, includes top, covers, windshield, speedometer and electric horn. For \$25 additional 36 x 3½-inch tires may be obtained instead of the smaller size regularly listed. The new model is to be put forth under a one year's guarantee.

The Muffler and the Cut-Out Nuisance

"Papa, what makes a gun go 'Bang'?"
"Powder, my son."

Papa lies. It is not the powder but the concussion resulting from its explosion that causes the bang. Concussion is a hard word to define to a small understanding, however, and so papa takes a chance with his conscience.

The parental short-cut to peace is to be recommended to those who are importuned to explain why an automobile makes a noise; the question always being safely interpreted to apply to the engine exhaust and not to the metallic clatter that sometimes arises from a pressed steel tool box bolted to a pressed steel running board. Gasolene may be said to make the motor roar. But if it be desired to placate a scrupulous inner man by telling the whole truth and nothing but the truth it will be necessary to get down to fundamentals, even if only for a minute or so.

When a body of gas under high compression is permitted suddenly to expand into a container the gaseous contents of which is at a lower pressure, an impact results which in principle is much the same as the impact resulting when a stone is thrown into the water, or, to make the illustration more exact, when a stream of water is poured into a pool. The impinging flow of gas causes a rippling disturbance of the inert body into which it is discharged, exactly in the same way that still water is disturbed under similar conditions. One important distinction is that while the churning of water is a result that can be both heard and seen, the "splash" that occurs when the ether is disturbed is audible only.

When the fleeing bullet "uncorks" the muzzle of a rifle the sudden release of the gases behind it produces an explosive disturbance of the surrounding ether which, in the small boy's vocabulary is called a "bang." By placing a series of curved blades in a casing surrounding the mouth of the rifle in such a way that the progress of the bullet is not impeded the sound of the report may be greatly subdued. About all that is left is a whistling sound as the spent gases escape from the casing and the sharp "ping" caused by the bullet itself as it plows its way through the air.

Much in the same manner as the firing of a rifle causes a percussive disturbance which is interpreted by the human ear as a peculiar and distinctive sort of sound, the sudden release of the gases imprisoned within the cylinder of an internal combustion engine when the slowly revolving cam wedges in under the tappet and pries the exhaust valve off its seat, is responsi-

ble for a similar report. And just as the bore and length of the gun, the grade of powder, the amount of the charge and the degree to which it is rammed, all are instrumental in determining the report of the shot, so the bore and stroke of the engine, the quality of fuel employed and proportions of the mixture, the quantity of gas and the compression are to be taken into account when the sound of an engine is to be analyzed.

The principle of the Maxim silencer for firearms, already referred to, is derived directly from the familiar gas engine muffler. It deprives the "exhaust" of the gun of its sound-producing qualities by robbing it of its kinetic energy. To accomplish this it deflects the gases and by suddenly changing their direction of travel causes them to expend their energy by impinging against the silencer blades.

In a Pelton water wheel the same idea is employed to produce power. Instead of the blades being stationary, as they are in a gun silencer, or in a gas engine muffler, they are mounted on the circumference of a wheel. Water flowing through a jet impinges against the blades, or buckets, as they sometimes are called, its energy of motion being translated into power at the wheel, while the water which overflows from the buckets on the lower side is absolutely inert and lacking in its former energetic quality. The principle of converting the kinetic energy of a moving fluid into the movement of a mechanism likewise is employed in water and steam turbines and in a somewhat similar manner.

In the case of either the turbine or impulse wheel the energy absorbed from the fluid is employed for power purposes. In the case of the muffler it merely causes stresses in the parts of which the silencing device is constructed but produces no external work. The energy there represented is used up in friction, and, in the case of a gas, in performing internal work, as it is termed, which is to say, in causing the gas to expand to a larger volume. This latter change is the principal one sought in the muffler, since the increase in volume also involves a reduction in pressure.

A similar effect may be secured by reducing the temperature of the gas, and this also is sought. But when the time element enters into account, as it must in the case of an engine exhaust where the successive discharges follow one another in extremely rapid succession, a material reduction in temperature can be achieved only where provision for a very rapid interchange of heat is possible. To muffle an engine by cooling the exhaust, therefore,

would require either a large volume of water, which would add weight to the apparatus, or else a rapid circulation of either water or air, which would involve the application of power and introduce mechanical complications. Hence expansion and friction chiefly are depended on for silencing purposes.

Hitherto the muffler question has received but little attention at the hands of the average motorist. Since the public came to take a wise and sometimes impertinent interest in automobile affairs, however, muffler practice has assumed a new importance. There is a never-to-be-forgotten significance in the popular discoveries that searchlights can be dimmed or extinguished while the car is being run through brightly lighted city streets, and that engine smoking can be suppressed. Even before the anti-dazzle and anti-smudge crusades, ordinances and even state laws had existed against the use of the muffler cut-out under certain conditions, but they were lightly regarded. Now, however, it is a different story. The public has roused to the important fact that the things that led to motorphobia, the things that made the automobile an abomination in the estimation of its opponents, are not germane to its usefulness. Therefore it is high time for the supporters of motoring in all its phases to study certain of its problems with renewed interest and attention.

Superficially it looks like a comparatively simple matter to fit a silencer over the end of an engine exhaust pipe and keep it there. Just why there should be such a device as a muffler cut-out, or why anyone should want to use it is something that certain thoughtful people find it difficult to understand. The more they look the problem over the less easy it is to gather the real use of the cut-out. There are many cars in which it does not seem to add the smallest part of a playful ponypower to the engine, let alone a single full-grown horsepower, and in which, also, it does not add materially to the noise—which is another important consideration. The only question is as to whether such a condition bespeaks the vanguard or the rear rank of automobile practice. As in the case of the shotgun or rifle, the answer is to be sought partly in the inherent qualities of the combustion process and partly in the silencer itself.

The root of the muffler problem carries it right back to the beginning of heat engine theory—thermodynamics, in other words. For the noise of the open exhaust depends on the pressure and volume of the

spent gases discharged. The musical note or "tone" of the exhaust also depends to some extent on the speed of the engine, which is to say, the frequency of the successive beats of the individual exhausts. Thus under certain conditions—a long and comparatively unobstructed outlet through the muffler or exhaust pipe and a smooth-running engine—a certain speed may be found at which the note of the exhaust is much louder than at other times and where it assumes a distinct and, by association, hugely inspiring, musical tone.

At such times, as the bespectacled scientist would painstakingly explain, the pressure of the exhaust and the frequency of its "beat" combine to produce a rate of vibration in the exhaust pipe and muffler which exactly corresponds to the natural "resonance" of the outlet channel. The philosophy of the thing is very like that involved in the familiar text-book illustration of the small dog which shakes the large bridge to its very foundations merely by trotting across it in the most innocent way in the world. Just as the old rain barrel used to "roar" when Young America hollered into it "a certain way," so the exhaust outlet will reinforce the note of the engine when conditions are just right.

This always will be true to some extent. The reinforcement of the sound waves created by the exhaust will be reduced however, in a measure as the shape of the outlet is bent or broken up by intervening blades and as its walls are prevented from vibrating, either through the use of non-resonant materials or through the mechanical dampening effects of flexible connections and lagging. A large diameter exhaust pipe leading straight through to the rear of the car with a cut-out just in front of the muffler usually will produce a fine deep roar at certain engine speeds. A smaller pipe or one that has sharper bends will have less natural resonance. A large pipe that is properly lagged sometimes may have less resonance than one that is not.

To go a little deeper into the thing, it is useful to consider how far the original design of the engine determines the quality of its exhaust. That it is more than a question of cylinder dimensions a moment's reflection will show, particularly if recollections of some of the early "one-lung" engines be particularly vivid. Small wonder that hill-climbing was in the hands of the gods when half the power went up chimney, so to speak!

Engine speed must vary, of course; that is an unalterable consideration. The pressure of the gases at the instant of release, which is the other determining factor in the sound of the exhaust, is an inherent property of the design. It depends to some extent on the quality of the mixture, which is to say, on the completeness and rapidity with which combustion is carried out, and it also depends on throttle opening, or on the volume of mixture previous to combustion, and on compression. Mainly, how-

ever, it depends on compression and on the timing of the exhaust valve. An early opening valve, other things being equal, means a noisy engine, a late opening valve one that is not so noisy. The reason is that the later the valve opens the lower the pressure in the cylinder. But these are things that are beyond the control of the motorist himself, and are practically unalterable once the engine has left the draughting board.

At the same time it is noteworthy that the deep-toned baying of some of the more modern engines is a perquisite of the long-stroke motor with a clear outlet. The relatively low pressure of the exhaust and the moderate rate of revolution renders them particularly easy to muffle without loss of power. That is the real point involved in the muffler problem. Any kind of an engine can be muffled down to a whisper. Such a course would involve the absolute strangulation of some motors, however. If you plug up the chimney the fire will not "draw," and if the engine exhaust is choked power is lost. If the outlet were entirely stopped the engine could not run. On this principle it will be recalled that some of the early engines were governed by a device which prevented the exhaust valves from opening when the speed became excessive.

Correct muffler design, therefore, provides a constantly increasing area in the passages through which the gas is led, and also a series of deflectors to check its velocity. But the constant aim of the engineer is to provide as much expansion as possible with no more mechanical impediment to the flow of the gas than necessary. Hence in place of the multiplication of perforated plates and tortuous passages that used to be employed, modern mufflers are of comparatively simple internal construction. They rob the gas of its energy by permitting it to expand to the lowest possible pressure before reaching the atmosphere.

It may be admitted without fear of contradiction that muffler design may be subject to considerable improvement during the next few years, particularly as the demand for quiet operation becomes more insistent. At the same time it is a fact that the average muffler now used, if in good condition, does not seriously hamper the engine, and that is the nub of the problem as far as the relations between the motoring and non-motoring elements of the public are concerned.

What is termed a good muffler is variously stated as absorbing from three to six per cent. of the total power output of the engine. A dirty muffler, of course, will absorb more. Some day, doubtless, mufflers will be so constructed that they can be cleaned without serious inconvenience. At present and with most constructions, cleaning is a difficult process and one which cannot be carried out thoroughly unless the casing is taken apart and the

plates brushed and scraped perfectly clean.

Even allowing as much as six per cent., however, the proportionate loss of power is small as compared with what is absorbed in other ways. Transmission losses, for example, seldom run below 20 per cent. on the average. In a 30 horsepower car, therefore, six horsepower would be lost in the transmission as compared with 1.8 horsepower absorbed by the muffler. With the modern tendency to overpowering, the last six per cent., therefore, seldom would be essential to the satisfactory performance of the car. As a matter of fact, most engines probably develop their full rated power with the muffler when running at normal speed, while the extra one or two horsepower which might be supposed to be added when the muffler is cut out, actually is materially reduced by the resistance of the exhaust piping and the friction set up in the cut-out itself. The very slight difference in speed observable when the average cut-out is opened is sufficient evidence of the comparative uselessness of the device.

That running with the cut-out open tends to keep the engine cool, is a familiar contention and one that is probably well grounded in cases where the muffler is of poor design or where it is literally filled with carbon deposit. When the muffler is of good design and is clean, it makes little difference. A dirty muffler, indeed, may become a very serious drag on the engine, but that fact need not be construed into an argument in favor of the cut-out. A dirty cylinder, too, will cause an engine to run poorly. Dragging brake bands use up a lot of useful energy, but when their poor condition is discovered it is not customary to remove them altogether; they are cleaned, instead.

Ultimately, of course, the designer will take care of the muffler problem, as he might have done before now had he not been busy with other things. In the meantime, the owner of a well put together car should have no real requirement for the muffler cut-out. If he finds that he has, he had better take it to the agent and learn what is wrong with it. The public is perfectly right in its contention that needless noise is an abomination and sooner or later the public will prevail.

"Yes, but—" says the man who owns one, "but still I don't quite understand why Jones's car makes so much more noise with the cut-out open than mine does."

"The probability is, Mr. Man, that Jones's car has a short-stroke engine and that the exhaust valves open under greater pressure than do those of your motor," answers the Y. M. C. A. student. "Another point is that the tonneau of your own car excludes a large proportion of the sound that actually is made by the engine. That is one reason why the man in the car and the man in the street are apt to be at variance in their views of the cut-out problem."

THE "NIGHT MAN" IN THE GARAGE

He Has Opinions of Managers and Things
and Voices Them—His Help and
His Worries.

"Who is the 'wise guy' that has been telling you all those things about running a garage that you have been publishing recently," asked a night foreman of an up-town garage of a Motor World man. "Well, no matter who he is, garage managers are nearly all alike in thinking they know all about the details of the garage business. But as a matter of fact few of them know much more than the office details. Of course they talk about the chauffeurs and others with whom they come in contact during the day, but they know little or nothing of what the night man has to contend with, because the night man seldom talks about his work. Of course the day foreman has his troubles, but the manager then is within reach and they are straightened out without much difficulty. With the night man it is different.

"I have been in the garage business for about ten years and know a thing or two that even the garage manager, the day foreman or the automobile owner may find hard to believe. These people know nothing about the doings after dark. Most of the managers I have come in contact with, expect the employee to 'deliver the goods' and nothing more. Never do they take the night man into their confidence and let him know 'who's who,' as it were. It is all very well as far as it goes but it does not go far enough. A night foreman should know all about every car, every owner and every chauffeur that is connected with the garage. Of course, as a rule, they become acquainted with the chauffeur but not with the owner, unless he happens to drive his own car and does not employ a chauffeur.

"In many walks of life the manager can give instructions and go away for the day with the knowledge that they will be carried out to the letter. With the garage business it is different. In many cases the managers are men who have drifted into the business because of their acquaintance with some man of means. Very few have their own money invested, unless it is a small sum in a corporation formed by financial acquaintances. This in many cases causes the manager to think he is the king pin of the establishment and he makes his own hours, as a general thing, from nine o'clock in the morning until about five in the afternoon.

"I don't mean to say that the manager has no right to make his own hours. He can do as he likes. However, I do mean, generally speaking, that few if any of them here in New York understand what the night foreman has to contend with in order to have the automobiles in first class con-

dition early in the morning. Owners, of course, are not expected to bother about such things. All they have to do is to remain out as long as they wish and order the car for a certain hour in the morning. In this they are correct. They pay for the service and without them the garage could not exist. Many managers do not grasp this fact and whenever a chauffeur makes a complaint, the night force is hauled over the coals. I have lost several positions because I would not let chauffeurs walk over me.

"My experience with chauffeurs has been extensive, because I have never been connected with a small garage, and therefore have come in contact with enough of them to be able to know the right kind from the wrong. I have found the chauffeur who has absolute control of his employer's car to be the best sort. That is to say, it has been my experience that the only chauffeur who has absolute charge of the car and can store it in whatever garage he desires I never have any trouble with. I know there are garages that practically are 'run' by such men but somehow we have escaped them. Our men are of the old school and take the car out only when absolutely required. They do not belong to the class that learned automobile driving in one of the 'schools' and went into the business because they intend taking life easy and make the automobile owner pay the freight. The new chauffeur is one who knows it all and wants to direct; while the experienced man never lingers around the garage unless his car requires some special attention. When the trouble is adjusted he goes his way. When the employer has finished his ride, this class of chauffeur also is through for the night. He drives when required and then only in the interest of his employer.

"With the other class, or, in fact, the several other classes, I might say, it is vastly different. As soon as the owner is finished they begin to think of joy riding. I have known this kind to return to the garage when the night work was finished and raise thunder if we did not wash and polish the car. I lost my position in one garage for failing to keep the washers overtime to accommodate one of these 'joy-riders.' The manager upheld the chauffeur and I was doing my best to compel the chauffeur to take the unwashed car to his employer's house and have the automobile owner make an investigation. Instead I lost the position. The real automobile driver, and I am glad to say I have met a large number, never makes an unreasonable request, nor does he take the car out at unseemly hours. But, I regret to say, they form a minority of the number in the business.

"It has been said by managers that it is a hard proposition to secure good night foremen. Well, many of them do not appreciate a good one, when fortunate enough to obtain the services of a man who endeavors to do his duty to both the owner

of the garage and the owner of the automobile. Then again, this night man has to direct the workmen, and after the manager leaves the building in the afternoon, he is, or rather he should be, the absolute boss. Generally he is not, because the manager has some one or other whom he wants placed. Usually it is a chauffeur who is out of a job and the manager is helping him along. Such an appointment generally means more work for the foreman. He cannot very well discharge the man, although the latter usually is no good. Then the real night worker soon neglects his duties because the ex-chauffeur is 'stalling,' with the result that the foreman's life is made miserable.

"In some garages they try to enforce a rule that the washers and other help shall not drink. I would rather have men around me who drink moderately—although I myself never drink—than one who does not indulge. The former will work as long as he is sure he is going to have his occasional drink, no matter how hard the work may be. Frequently they will work overtime without being told, although no extra money is allowed for overtime. On the other hand, the ones who never drink, frequently 'go up in the air' at a small thing and walk out of the building. I have had them to do this on me at three o'clock in the morning, when at least twenty automobiles had to be washed before sunrise.

"The night foreman should have absolute charge of everything because he is called to account for everything that is amiss. He is responsible for the shortcomings of the other help and he should have power to employ his entire force. Many managers say that they give such power to the foreman, but frequently they order the night foreman to retain a particular man or to make a place for someone else whom the foreman never has seen and who may or may not fill the bill. If this is giving entire charge, well, you will have to 'show me.' I have been up against all classes and I know. Some managers, I must admit, do back up the night foreman in everything, but they are few and far between and soon leave the garage end of the business for some place in the automobile industry that gives larger financial returns.

"Regarding the pay of the night help. The foreman, as is generally known, receives very little over three dollars a day for a week's work of seven days. Of course some get five dollars a day, but as a rule it is three or four dollars. The washers receive \$18 for a seven-day week if they furnish their own boots and aprons, or \$16 if the garage furnishes the boots; and the other employees range from that amount down to \$10 a week. The work is worth more, in fact at least 25 per cent. more, especially as vacations are unknown and for each hour or day lost a deduction is made. This is not right and is one of the reasons that the help is constantly changing. I like to hold my men together as

long as possible, for it is the only way to obtain good results. They get to know every car and take an interest in their work. With better pay more pleasing results could be obtained. I do not mean from the automobile owner's standpoint but from the viewpoint of the foreman who takes an interest in his task. Many cars have left our garage in the morning that were satisfactory to the owner, but I can honestly say they did not satisfy me.

"Garage managers claim they cannot pay larger wages because the automobile owner will not pay more for storage. This is nonsense. Give the employes half of the commission that is paid over to the average chauffeur each month and better salaries will result. Of course it is not for me to complain about what the chauffeur receives, as I have nothing to do with that end. What I want is more money for the help that actually accomplishes the things that keep the garage owners and managers in business. Then again the chauffeur who is always looking for a commission or tip is the hardest one to get along with; they are constantly kicking and never seem to be satisfied. On the other hand, I know chauffeurs who do not ask for commissions nor would they accept one of it were offered. They never kick. When they have to get out particularly and want the boys to be extra particular, I have known them to give them a little present. The other kind demand things. However, it is the same in every walk of life, I suppose, but the mean traits of character do not come out as strongly as they do around a garage.

"There are many more things concerning garages and their management that I could talk about, but should I tell too much, not only the chauffeur, but garage owners as well will be after my scalp, but as my business is looking after the night end of the garage and although I quickly would change for a daylight position, I have been so long a night owl that I suppose I had better remain one."

Shoe Repairing Brought Up to Date.

To telephone for a cobbler, have him dash up to the door in an automobile, take the shoes and return them, soled or heeled or patched, in a few hours—also per motor car—would seem like a dream of 1920 or thereabouts. At least to the average cobbler it must seem a fairy tale. But, as a matter of fact, a shoe repair concern in Syracuse, N. Y., already has installed one motor-driven delivery car, of 1,000 pounds capacity, and is contemplating the addition of another. The driver of the car is furnished with a long list of people residing in a certain direction from the store and he drives to their homes at good speed. In less than two hours he has finished the trip, is back at the store with a hundred or more pairs of shoes, and is off on the second trip. Returning from this trip he finds the first batch of shoes ready for delivery and repeats his morning route. The

store's customers thereby get their shoes back in about three hours without having to move out of their homes, and at a price equal to that charged by the average shoe repair man. Since installing the automobile delivery wagon, the business of the enterprising "quick shoe repair company," as it styles itself, has grown extraordinarily, as 75 per cent. of the orders come by telephone, and another wagon soon will be added to take care of the increased work. As an advertising proposition it has proven of great value, also, some of the orders coming from as far as four and five miles away. The average cobbler is lucky if his trade extends to four or five blocks on either side of his little shop and he never bothers about fetching shoes or delivering them after repairing.

Tow Ropes Lead to \$30,000 Suit.

The unusual accident in Salt Lake City on February 18, 1911, in which the circulation manager of the Salt Lake City Tribune, James W. Musgrave, was run over by an automobile, had its sequel last week, when a suit for \$30,598.50 damages and costs was filed against the Studebaker Brothers Co., owner of the car. Musgrave, in his complaint, alleges that on the evening of the day named a string of Studebaker automobiles connected with ropes was being taken up East Second South street; that the cables or ropes were allowed to drag across the crossing; that he stumbled over one of them, falling beneath one of the cars which passed over his body. He furthermore alleges that he was permanently injured and asks judgment against the company in the sum of \$30,000, with \$598.50 additional for expenses incurred.

Horses Ousted After 21 Years' Service.

After using horse-drawn stages for 21 years, the Forest Park Hotel, at Forest Park, Pa., has discarded the antiquated equipment and installed a number of seven-passenger touring cars to carry prospective guests from Bushkill, the railroad station, over the four miles of five per cent. grade to the hotel on the hill. While the horse-drawn stages were only capable of making three round trips at the utmost, the automobiles can make as many journeys as are desired, doing the work much better, quicker and to the greater comfort of the passengers than it has been done before. So successful has the equipment shown itself, that Arthur Lederer, the hotel owner, intends to add two more cars for next summer.

Michigan Lad as a Lamp Collector.

William Auglin, a 15 year old boy, who is in jail in Grand Rapids, Mich., has confessed to having pilfered lamps and other accessories from more than 100 automobiles. In his father's barn 20 headlights and 70 sidelights were recovered, in addition to 30 bicycles and other things.

Rambler
Sixty-four

TIRE trouble destroys the pleasure of touring and converts your outing into drudgery unless you drive a Rambler. This is the only car in America equipped with the Spare Wheel. It eliminates worry about tire trouble by making it so easy to substitute a wheel with a perfectly inflated tire for an injured one. No tiresome pumping in the hot sun or cold rain. The change is quickly made and provides a permanent remedy. Every feature of the Rambler is designed for the owner's comfort, safety and convenience. The Offset Crank Shaft enables you to throttle down on high gear no faster than a man usually walks; to glide along quietly without frequent gear shifting in crowded traffic, and obviates the necessity of rushing the hard pulls through sand and up grades. The Straight Line Drive saves power; big wheels and tires afford added comfort and tire economy; the brakes are larger than necessary; the safety starting device protects you from injury while cranking.

The Thomas B. Jeffery Company

Main Office and Factory, Kenosha, Wisconsin
Branches: Chicago, Boston, New York,
Milwaukee, Cleveland, San Francisco

A telephone message to the nearest Rambler representative will bring this car to your door for inspection. The new catalogue is ready. Send for it.

The old tiresome way

The modern Rambler way

989,457. Automobile Spindle Device. Harry Walker, Maxwell, N. Mex. Filed Dec. 24, 1910. Serial No. 599,201.

1. A lamp operating mechanism comprising a lamp bracket having an angled lower end adapted to be pivotally mounted upon a spring, a rod pivotally connected with said angled end, and adapted to turn said lamp, a bracket adapted to be secured to the spring, a vertical arm pivotally connected with the lower end of said bracket and provided in its upper portion with a longitudinal slot, a bolt passing through said slot and slidably connecting said first mentioned rod with said vertical rod, a horizontal arm, a universal joint connecting said horizontal arm with said vertical arm, a link, a universal joint connecting said link to said horizontal arm and means for connecting said link with a wheel knuckle.

989,501. Driving and Steering Device for Vehicles. Edward Anthony Gotterba, Bisbee, Ariz. Filed June 30, 1908. Serial No. 441,053.

1. A propelling and steering device comprising a driven shaft having a spherical terminal, a wheel having a two part hub formed with a socket in which the said spherical terminal is journaled, a ball key seated on the said shaft terminal and engaging an elongated groove in the said hub, a steering and guiding head under the control of the operator and having a flange engaging the inner face of the hub, a retaining ring engaging the inner face of the hub and having a portion extending over the said flange, and bolts extending through the retaining ring and the parts of said hub.

989,515. Carburetter. Edmund Sprung and Harry Rose, Detroit, Mich. Filed June 3, 1910. Serial No. 564,758.

1. In a carburetter the combination with a float feed chamber, of a carburetter chamber casing comprising a cylindrical shell having at one end thereof an air inlet opening and having intermediate its ends an air outlet opening in constant communication with said inlet opening, a non-rotatable hollow cylindrical throttle having apertures adjacent the outlet opening and a series of fuel supply tubes projecting diametrically into said throttle and terminating near the inner surface thereof, said throttle being longitudinally movable in said casing to bring said apertures into and out of register with said supply tubes.

989,659. Magnetic Tachometer. John K. Stewart, Chicago, Ill. Filed Mar. 29, 1909. Serial No. 486,362.

1. In a magnetic tachometer, in combination with a case, a post within the case; a permanent magnet element and an armature, one mounted for rotation on the post and the other supported fixedly on the case, the magnet element comprising a carrier and a magnet movable radially on the carrier; a low resistance disk positioned between the magnet element and the armature, having a spindle provided with a step bearing within the post and extending through the fixed element; a spring which operates to hold the disk yieldingly against rotation away from a predetermined position; an indicator carried by the spindle and means for adjusting the magnet radially on the carrier.

989,675. Headlight. Richard H. Welles, Kenosha, Wis., assignor to The Badger Brass Manufacturing Company, Kenosha, Wis., a corporation of Wisconsin. Filed Sept. 19, 1910. Serial No. 582,613.

1. In a headlight the combination with a lamp body of a reflector therein, a burner movably mounted between the front end of the lamp and said reflector, means for shifting said burner laterally in a substantially horizontal plane and means for shifting said burner upwardly and forwardly.

989,678. Automobile Starting Device. Clark B. Wilcox, Union City, Mich. Filed June 10, 1910. Serial No. 566,183.

1. An engine starter including a distributing cylinder having ports connected to the respective cylinders of the engine, a compressed air container surrounding said distributing cylinder, valves for closing the respective ports, a member mounted for rotation within the distributing cylinder, means for transmitting motion thereto from the engine and means for manually shifting said member toward the valves to unseat the valve in the path thereof and admit air from the container to the opened port.

989,697. Carburetter. Lorin L. Cutler, Danville, Ill., assignor of one-sixth to Thomas S. Cutler, one-sixth to Samuel H. Cutler, and one-sixth to Lorin Cutler, Danville, Ill., Filed July 22, 1910. Serial No. 573,265.

A carburetter comprising a casing having an air inlet at its lower end, a vapor outlet at its upper end, a disk removably mounted in the air inlet and having openings through it, a series of concentric conical screens having their bases supported upon the disk over its openings and having their walls parallel with and spaced from each other, and a liquid fuel supply pipe leading through the side of the casing and having substantially semi-circular branches pierced with a ring of apertures standing above the wall of the uppermost screen.

989,742. Speedometer. John F. Wilkie, Hibbing, Minn. Filed Oct. 23, 1909. Serial No. 524,104.

In a self-propelled vehicle, the combination of a vehicle body; a driving mechanism for propelling the same; an indicator shaft which extends from end to end of and is carried by said vehicle body; a governor mechanism which is driven by said driving mechanism and which drives said indicator shaft; a pair of dials one of which is mounted at the front of said vehicle body and the other of which is mounted at the rear of the same; and a pair of index hands, one for each of said dials; said index hands being moved over said dials by the turning of said indicator shaft in response to the movements of said governor mechanism and said dials being mounted in plain view from outside of said vehicle body.

SHAWMUT TIRE CO., Boston, Mass.

989,846. Steering Mechanism for Self-Propelled Vehicles. Charles B. Hatfield and Charles B. Hatfield, Jr., Cornwall-on-the-Hudson, N. Y., assignors to Hatfield Company, a corporation of New York. Filed Mar. 12, 1910. Serial No. 549,022.

1. A steering mechanism for self-propelled vehicles comprising a steering axle pivotally mounted on a vehicle body, an arc-shaped guide pivotally connected to the axle, a steering post on the vehicle body held against vertical movement, a sprocket wheel on the steering post, and a chain passing around the guide and having connection therewith operatively engaging the sprocket wheel, said arc-shaped guide being supported from the vehicle body by means of the steering post and means connected with the sprocket wheel to preserve the relative position of the guide therewith.

989,884. Rotary Fan. William Sparks Jackson, Mich. Filed Sept. 6, 1910. Serial No. 580,623.

1. In a rotary power driven fan, a stationary hub, a rotary shaft journaled in the hub and provided with cone bearings, one of which is adjustable axially, fan blades having a supporting web mounted on one end of the shaft adjacent to the adjustable cone, means for locking the web to the shaft to rotate therewith and to permit it to be moved endwise relatively thereto, separate means for locking the web to the adjustable cone to hold the latter in its adjusted position against relative movement and movable means on the shaft to hold the web against axial movement when adjusted for use.

989,897. Steering Device. John F. Douthitt, Boonville, Ind. Filed Apr. 25, 1910. Serial No. 557,481.

1. The combination of a rotably mounted shaft section, a second rotably mounted shaft section arranged in longitudinal alignment with the first section, a clutch connection between the two shaft sections, whereby the second one may have a limited rotary movement independent of the first, opposing disks fixed to the two shaft sections, the disk on the first shaft section having a catch receiving seat and the disk on the second shaft section having a seat formed with inclined or cam surfaces and adapted to be brought into register with said catch receiving seat, and a spring projected catch adapted to enter said catch receiving seat and having a V-shaped portion to enter said seat having the inclined or cam faces.

989,919. Water Gauge. Joseph J. Menville, Houma, La. Filed Aug. 24, 1910. Serial No. 578,627.

1. A gauge comprising a housing provided with a reflecting inner surface, upper and lower lugs within said housing, a sight tube within said housing, means for clamping said tube to said lugs, means whereby water may be drained from said tube and for controlling the escape of air from said tube.

989,934. Engine Starter. Charles H. Smith and Arthur L. Goddard, Rockford, Ill.; said Goddard assignor, by mesne assignments, of one-fourth to Walter M. Lawton and one-fourth to Walter B. Taylor, Rockford, Ill. Filed Feb. 23, 1910. Serial No. 545,356.

1. In an engine starter, in combination, a shaft; a ratchet wheel fixed on said shaft; a pulley loosely mounted on said shaft; a pawl carried by said pulley and adapted to

engage said ratchet wheel; an idler; an endless connection extending about said pulley and said idler and attached to the pulley; a hand lever; and connections between said hand lever and said endless connection, said connections including a link having a portion adapted to engage the pawl and remove the pawl from engagement with the ratchet wheel.

989,963. Starting Mechanism for Internal Combustion Engines. Herbert M. Halls-worth, Riverside, Ill. Filed Aug. 19, 1910. Serial No. 577,926.

1. 'The combination with a multiple cylinder internal combustion engine, of engine starting mechanism therefor, comprising a supply of compressed fluid pressure, normally closed valve mechanism for controlling the flow of fluid from said supply to the cylinders of the engine and means operated by mechanically actuated fluid pressure controlling valves of the engine for opening said first named valve mechanism for the purpose set forth.

989,979. Transmission Gearing. Charles O. Johnson, Boston, Mass. Filed Nov. 6, 1907. Serial No. 401,042.

1. In a transmission gearing the combination with a driven shaft, of a plurality of gears of different sizes thereon, a countershaft, a plurality of gears of different sizes thereon, means to slide the gears on the countershaft and cams acting on both ends of one of said shafts to move it toward and from the other shaft.

989,984. Internal Combustion Engine. Joseph Nicolas Kieffer, Sevres, France. Filed Oct. 29, 1909. Serial No. 525,372.

1. In an internal combustion engine, the combination with the main cylinder and

Franklin Pneumatic-Tired Trucks

A Franklin one-ton truck, put in service by the Liquid Carbonic Company of Chicago, December 12, 1910, has covered 8,000 miles and is still using the original set of tires.

Detailed analysis of the cost of fuel and oil for this work shows the following averages:

Average mileage per day	52.46
Average mileage per gallon gasoline	9.8
Average mileage per gallon oil	191.2
Average cost per mile, gasoline and oil	\$.019
Average cost per mile of tires (based on 10,000 mile service)	.034
Average cost per mile for tires, gasoline and oil	.053

Let us tell you what the Franklin truck will do for you in your business.

Gramm Representation is a Complete Business in Itself

The steady receipt of "repeat orders" proves the soundness of the Gramm proposition.

Gramm Trucks are in as great demand, proportionately, in small cities as in large. Our distribution covers, approximately, all cities of largest size, like New York, Philadelphia, Chicago, San Francisco, etc. Valuable representation can still be secured by men of the right calibre.

If you are interested in establishing an attractive business of immense possibilities, to which you can devote all your energies, arrange with our sales department, either by letter or wire, for open territory.

The Gramm is made in 1-Ton, 2-Ton, 3-Ton, and 5-Ton Models.

No. 6

GENERAL MOTORS' TRUCK POLICY

Selling Company Formed to Market Output—Greatly Enlarged Line and New Service Department in View.

Having formed a separate company to handle its export business, the General Motors Co. has carried the idea further by organizing the General Motors Truck Co., which will control and market the entire output of all the General Motors' plants producing commercial vehicles, specifically, the Rapid and Reliance plants at Pontiac and Owosso, Mich.

The officers of the Truck company, the headquarters of which will be in Detroit, are the same as those of the General Motors Co. itself, as follows: Thomas Neal, president; Gleeson Murphy, vice-president; James T. Shaw, treasurer; Standish Backus, secretary.

H. S. Stebbins will be manager of the Truck company, and T. P. Myers, sales manager of the Rapid company, and L. J. Fasquelle, sales manager of the Reliance company, will continue to act in their present capacities.

The Rapid and Reliance vehicles, it is announced, will form the nucleus of a new line, the merger of the two selling departments being "merely the beginning of a plan to market a complete line of commercial cars which will be so broad and comprehensive as to cover every branch of hauling and delivery." There also will be established a "service, efficiency and maintenance department which will be equipped to analyze every phase of commercial hauling, apply or adapt the right truck or delivery wagon to the demand as it exists and maintain them in efficient service."

Poor Joke Played on Detroit Press.

Detroit is making a bid for the factory which Benz & Co., the famous German makers, are said to be contemplating establishing in this country. The Michigan

metropolis has offered the necessary land and the presence of a Benz engineer led some one to hoax the Detroit newspapers with a story that Diederich von Diebstahl, president of Benz & Co., and Karrel Schubjak, a director, were in the city and had acquired 10 acres of ground on which the American factory would be erected; also that James J. Brady, formerly of the Chalmers Motor Co., had been engaged to manage the plant. As a matter of fact, neither the Benz president nor the director is in this country, and their names as published in Detroit do not in any way resemble the gentlemen's correct names; they are "joke" names and rather insulting; broadly translated one means "robber," the other "wheelbarrow shover." Officials of the Benz Motor Import Co., in New York, state that the matter of an American Benz factory consists chiefly of an offer of land in Detroit which has not been accepted and never may be accepted. The Import company itself, however, just has leased two floors of the Galvin building in Long Island City, N. Y., which will be used as a semi-assembling and body building plant; the chassis will be imported, as heretofore.

Natco Trucks Coming from Bay City.

The National Motor Truck Co. has been organized in Bay City, Mich., by interests identified with the National Cycle & Mfg. Co., of that city, and expects to begin operations about October 1st next. It has purchased a large tract of land on which three factory buildings will be immediately erected, the first, 268 x 66 feet, three stories; the second, 50 x 60 feet, and the third, 80 x 60 feet. While heavy trucks ultimately will be manufactured, the first effort of the new company will be centered on the production of a 1,000 pounds delivery wagon which will be styled the "Natco." Henry B. Smith is president and F. C. Finkenstaedt is secretary-treasurer of the truck company. They hold the same offices in the National Cycle & Mfg. Co., which for several years has manufactured parts for several of the best known motor car companies in this country.

WEED CHAIN GRIP PATENT UPHELD

Court of Appeals Reverses Its Opinion in Excelsior Case—"An Entirely Novel Concept," it Now Declares.

After all, the Maxim & Bardwell patent of 1901 covering a leather non-skidding strap, does not anticipate or invalidate the Parsons patent of 1903, which covers the well-known Weed chain tire grip. The same court, the United States Circuit Court of Appeals for the Seventh District, which in January last upset the Parsons patent by reversing the lower court and holding that if "metal be substituted for leather the Maxim & Bardwell device becomes the Parsons device," and that such substitution did not constitute patentable invention, has changed its opinion, and last week handed down a decision reversing itself and affirming the judgment of the court below that the Parsons-Weed patent, No. 723,299, "is basic to a large extent."

It is said to be the first time in 25 years that the court has taken such action. The Weed company's attorneys, who so signally distinguished themselves by thus convincing a high tribunal of its error, are Frederick S. Duncan, of New York, and Edward Rector, of Chicago.

The parties whom the Weed company charged with infringement were the Excelsior Supply Co. and the Motor Appliances Co., of Chicago, who were responsible for the Zig-Zag chain grip, and the Pitts Chain Grip Co., also of Chicago, the evidence in the Excelsior case being applied to the Pitts suit, which rose and fell with the decisions affecting the Excelsior action. The Court of Appeals's reversal of its opinion holds that both the Zig-Zag and Pitts grips are infringements of the Parsons patent.

When the Court of Appeals for the Seventh, or Chicago, district, declared against the Parsons-Weed patent on January 2nd, its opinion, written by Judge Grosscup, was such as to hold no hope of the present re-

sult. Despite the forlorn hope, however, the Weed people applied for an oral rehearing of the case and it was accorded them. They then went all over the old ground in the effort to convince the court—composed of Judges Grosscup, Baker and Kohlsaat—of its error, seeking to show that Maxim & Bardwell's leather straps not only did not permit of the loose adjustment and "freedom of circumferential travel" or "creeping," which is the essence of the Parsons patent, but that the leather straps actually would be destroyed by use and were therefore commercially worthless.

This argument was presented in February and that the court considered the matter carefully is indicated by the fact that it required six months for the three learned justices to reach the conclusion that they had erred in their previous judgment, and that the "Parsons concept was an entirely novel one in connection with automobile anti-skidding devices." No one reading their final conclusion, however, would suspect that it is in the nature of a self-reversal; in no manner does it even suggest that previously the court had rendered a directly contrary opinion.

That portion of the decision which now sustains the validity of the Parsons-Weed patent, is as follows:

There are a number of patents in the record (Nos. 595,099, E. H. Graves, Dec. 7, 1897; 667,457, E. C. Rehfeld, Feb. 5, 1901; 135,128, D. W. Kellogg, Jan. 21, 1873, and others), known as metal traction devices, substantially like the patent in suit except that they are relatively narrow, intended to be placed upon the tread of a deflated tire and held in position on the tire by the tight inflation of the tire; that is to say, the radial pressure of the wheels. Of course, this pressure contemplated that there should be no movement of the bands around the wheel. They were, in this respect, different, both in underlying principle and in construction, from the patent in suit; nor would they have answered, we think, for automobiles (they were devised for bicycles), where the strain is hundreds of times greater than on a bicycle. The most these patents do is to point out and illustrate the prior use of metal for an anti-skidding band.

There are also a number of patents in the record (Nos. 98,126, R. E. Thomson, Dec. 21, 1869; 567,245, J. H. Lowrey, Sept. 8, 1896; 639,846, J. Coan, Dec. 26, 1899; British Patents Nos. 3,046, Archer, 1871; 14,719, Rose, 1898, and others), known as metal armors or jackets. But all these devices were constructed with the idea of rigid attachment to the tire. The tendency of these devices, in common with all other devices, to creep, is not the "freedom of travel" that Parsons sought. They are incapable of freedom of circumferential travel. None of these constitute anticipation, in our opinion.

Neither do the Gilbert nor Thomson devices, pressed upon us at re-argument, constitute anticipation. The Parsons concept was an entirely novel one in connection with automobile anti-skidding devices. It reversed entirely the prevailing notion that an anti-skidding device must, as far as possible, be integral with the tire. Gilbert and Thomson had no knowledge of automobiles, bicycles, or pneumatic tires of any

(Continued on page 406)

JUNE EXPORTS EXCEED \$2,000,000

Big Increase in British Oceania—Average Values Lower—Gains and Losses During the Fiscal Year.

Setting another high water mark for the month of June with a total of 1,554 cars, valued at \$1,702,872, exported to foreign countries, American automobiles exceeded last year's totals by 570 cars, and \$64,550 in value. Parts to the extent of \$324,886 worth were sent out of this country, as against \$256,484 worth in June, 1910. The most significant item of these statistics undoubtedly lies in the extraordinary drop in value, which sank from an average value of \$1,665 in June, 1910, to \$1,095 in June, 1911. Canada and Great Britain still remain the two best customers, although their proportionate increases have been smaller as in previous months, England, in fact, showing a loss of fully \$100,000 from its quota of June, 1910. The greatest gain is manifested by British Oceania, which increased its purchases from \$30,638 to \$206,130, a clear gain of 560 per cent. It now occupies third place, having passed Other Europe and South America.

The figures for the twelve months of the government's fiscal year, ending June 30, 1911, reflect the upward tendency which has been so pronounced during the past two years. During this period there were exported 11,803 cars, valued at \$12,965,049, and parts valued at \$2,544,180, as against 6,926 cars, worth \$9,548,700, and parts valued at \$1,641,520, during the previous fiscal year.

In this list Canada still leads by a wide margin with \$6,774,769, with Great Britain in second place with \$2,595,679, and British Oceania third with \$1,352,532. The showing of the latter, in particular, is noteworthy, as it jumped from seventh place in last year's list to third place, passing France, Other Europe, Mexico, and West Indies. Gains and losses are fairly well divided among the twelve divisions, seven of them registering increases, while five show losses. The report in detail:

	June		Twelve months ending June		
	1910	1911	1909	1910	1911

Wants Van to Disclose Its Condition.

Alleging that the Van Motor Car Co., of Grand Haven, Mich., which built a low priced runabout, has incurred liabilities amounting to \$85,000 and has assets of but \$45,000, the Frost Gear and Machine Co., of Jackson, Mich., has instituted an action designed to compel the Van company to disclose the exact state of its finances. A temporary injunction restraining the company from disposing of any of its property already has been obtained.

Tire Exports Pass \$2,000,000 Mark.

Exports of automobile tires for the month of June, 1911, reached \$246,625, while other tires exported were valued at \$54,063. During the year ending June 30, 1911, \$2,085,107 worth of automobile tires and \$592,470 worth of other tires were shipped out of the country. No comparative figures for the corresponding period of 1910 are available, as the government did not list tires separately previous to July 1, 1910.

Taxicab Company Files Its Schedule.

Schedules in bankruptcy of the Union Taxicab Auto Service Co., of 252 West 40th street, New York, which failed several weeks ago, show liabilities of \$15,087 and assets of \$4,864, consisting of taxicabs, \$4,225; accounts, \$570, and unexpired licenses, \$69. Among the creditors are the also embarrassed Cab and Taxi Co., \$10,319; New York Cab Co., \$1,200; W. J. Duane & Co., \$1,511, and Allan Lexow, \$1,520.

Barnes Acquires Steel Castings Account.

Claire L. Barnes & Co., of Chicago and Detroit, have added the Fort Pitt Steel Castings Co., McKeesport, Pa., to their accounts and will market its entire product of small steel castings. These castings are distinctive in that they are made from a direct steel process.

Truck Factory Starts in Grand Rapids.

The Van-L Commercial Car Co. is the unusual title of a truck building concern which has commenced operations in Grand Rapids, Mich. It occupies a two-story brick factory at the corner of Third and Railroad streets.

NEW MEN ENTER SELDEN AFFAIRS

James J. Joyce is Among the Number; He Assumes Sales Management—Changes Presage Aggressiveness.

Although it is not the intention to depart from its policy of happy mediums in production, power and price, the Selden Motor Vehicle Co., of Rochester, N. Y., has undergone an internal semi-reorganization which it is confidently believed will make the Selden car more than ever a factor in the trade. New men and new money both have entered into its affairs and the effects of a fire in June, which considerably disturbed factory operations, have been overcome.

Of the new men who have become identified with the company, George C. Gordon, the cashier of a Brockport (N. Y.) bank, and a member of a wealthy family, has been elected treasurer, while James J. Joyce, one of the most widely known veterans of the trade, who for years was general manager of the American Locomotive Co.'s automobile department, has become general sales manager. Fred A. Law, another veteran, who was connected with the Columbia Motor Car Co. and other concerns, and who has a reputation as a designer and mechanical expert, has been engaged as designer and as superintendent of the Selden factory.

To reach the larger and more desirable class of trade, Fred A. Hoblitt, who previously was general superintendent of the American Locomotive Co. and who is president of the Rector Engineering Co., has been prevailed on to give part of his time to the Selden interests. He will visit the "big trade" with which he is so well acquainted.

While these accessions naturally will add to the aggressiveness of the Selden establishment, R. H. Salmons will continue to preside over it and hold the reins in his dual capacity as vice-president and general manager.

Factory Leased for White Star Truck.

For the purposes of truck manufacture, the White Star Motor and Engineering Co., of Brooklyn, N. Y., has leased the three-story brick structure at 18-22 Henry street, in that city, and as soon as extensive alterations are completed will seriously enter into the business in which it has been tentatively engaged in temporary quarters at 1380 Atlantic avenue. The company is composed of John T. Whalen, president; Robert Beutel, vice-president, and George Oterbein, secretary, and grew out of the success of a 1½ ton truck built for Whalen Bros., of which John T. Whalen is the head, and who has been engaged in the Brooklyn furniture trade for some thirty years. This truck will be reproduced by

the White Star company. It employs a two cylinder, two cycle, three port engine, 5 x 5 inches; three speed selective transmission, cone clutch and semi-elliptic springs.

Big Office Building for Johns-Manville.

When the palatial twelve-story building at 41st street and Madison avenue, New York City, which is in course of erection, is completed, in May next, it will be occupied wholly by the H. W. Johns-Manville Co., makers of the J-M asbestos brake lining and other specialties. The building will be of the early Italian Gothic style of architecture, the three lower stories being of limestone and the upper stories of gray-brown Roman brick and terra cotta. It will be styled the Johns-Manville Building and will have the unique distinction of being one of the few twelve-story structures to be entirely occupied by a manufacturing concern for office purposes only.

Changes Occur in Croxton Company.

H. A. Croxton having retired from the presidency and general management of the Croxton Motor Co., of Cleveland, Ohio, a general shift about of officials has occurred. J. P. Stoltz, former vice-president, has succeeded to the presidency; H. D. Michaels, former secretary and treasurer, has relinquished the secretaryship to F. H. Smith, but still retains the office of treasurer, and George S. Patterson, formerly a Rambler branch manager, has succeeded W. F. Melhuish as sales manager.

Marathon Going Into Motor Trucks.

Having decided to enlarge its sphere by engaging in the manufacture of commercial vehicles, the Southern Motor Works, of Nashville, Tenn., has increased its capital stock from \$400,000 to \$600,000 and changed its name to the Marathon Motor Works. Marathon is the name of the touring car which it has manufactured for several years on a limited scale, and which will be continued.

No Quorum for U. S. Motor Meeting.

The meeting of the board of directors of the United States Motor Co., which was called for Thursday last, 27th ult., did not occur, because of lack of a quorum. Among other things that were to have occurred was the election of George W. Perkins as a member of the finance committee. Probably no meeting will be held until September.

Holmes Becomes Clark-Carter Manager.

Fred Holmes, who resigned as general manager of the Jackson Automobile Co., of Jackson, Mich., on June 1, has become general manager of the Clark-Carter Automobile Co., in the same city. When he resigned, Holmes expected to take a long vacation, but the Clark-Carter people induced him to change his mind.

MIDGLEY TREAD DOES NOT INFRINGE

United States Rules Against Adams Patent—Also Discusses Application of "Bicycle Ideas" to Automobiles.

It required only about one week for Judge Platt, sitting in the United States Circuit Court for the District of Connecticut, to become convinced that the Midgley wire grip incorporated in the tread of the Hartford automobile tires is not an infringement of Patent No. 609,320, issued August 16, 1898, to Dr. Calvin T. Adams, of New York, covering "a vehicle tire," and more specifically a bicycle tire. Late last week he rendered a decision to this effect in the suit for infringement of the Adams patent brought by its owners, the Metallic Rubber Tire Co., of Jersey City, N. J., against the Hartford Rubber Works Co., of Hartford, Conn.

The case was somewhat unusual, in that before the patent was granted to Adams, he eliminated a claim he had made for a tire with wire interwoven in the tread, which, however, was substantially renewed in the suit which Judge Platt just has decided. The court's opinion is notable, also, in that it appears to indicate inventions relating to bicycles and which were conceived before automobiles were in mind, of which so many have been brought to bear on the automobile industry, are not likely to receive much weight at his hands. His opinion concerning the Adams patent is as follows:

This is the usual bill in equity, asking for injunction and accounting, based upon Letters Patent to Calvin T. Adams, No. 609,320, issued August 16, 1898, for a vehicle tire.

The defenses are invalidity, irregularity of issue, non-infringement and lack of equity.

The first thing to settle is, what the inventive concept of Adams was, and what he claimed under it. In discussing that we must not forget that the Adams concept was formed in 1895 when the bicycle was in vogue and the heavy motor car of today was a vague uncertainty. His mind was concerned with bicycles alone, and nothing else, except possibly tires of a similar character.

We must go to the file-wrapper to learn what he did. He wanted to show how the tires of bicycles and "other wheeled vehicles" (in which latter phrase he undoubtedly had in mind carriage wheels) could be so treated as to retain their resiliency and at the same time be prevented from slipping on smooth and wet roadways.

The yielding tires of bicycles had up to that time, he says, been provided with spikes extending well beyond the head, so as to penetrate and give a locking hold upon ice, but these could not be used on roadways without destroying the tire or making it hard work to propel the machine.

Such tires had also been provided with external metallic fittings to bear on the ground when the tire is compressed, but such fittings were too heavy, expensive and complicated.

His idea was to provide a tread for the yielding tire which would not add much to the weight or expense of the tire, could be easily applied, would last, would not slip on smooth or wet roadways, and would not "materially increase the labor of propulsion."

His way of doing it was to weave into the yielding material of the tread, wire which should appear every now and then flush with the surface, and at other points be embedded within the material of the tread, or to embed within the material of the tread studs of metal or other hard substance which should come up flush with the surface.

In this way he expected that the metal would get a grip on the roadway and prevent slipping, but at the same time the tread and metal would readily yield with the tire and permit the flexible material of the tread to act as a cushion.

He then proceeded to tell people how to carry his idea into practice. He made pictures of pneumatic bicycle tires embodying his invention, both on the surface and in cross sections.

His cross section, Fig. 2, shows the hard bearings C C made by weaving or stitching metallic wire through the tread in lines running lengthwise of the tread (as shown in Fig. 1, so that the wire is alternately flush with the surface and embedded within the material of the tread. He then explains that the wire being interwoven with the material of the tread, will remain securely therein after the exposed portion has worn off, and that the exposed ends will then act in the same way as the hard bearings. This is the nearest he comes to the idea of "cat's claws." He appears to have thought that some virtue would be left in his hard bearings, even after they were worn apart, but that was an incidental and not a substantive thought.

In his cross section, Fig. 3, he shows his hard bearings made by sticking metal studs into the yielding material of the tread, so that their heads would come flush with the roadway and act like the exposed portions of the metal wire in Fig. 2. (That hard bearing would, of course, always be ready for work, no matter how much the material of the tread should wear away, and he would not have to face the possibility of loose ends dangling about, which was very likely a comfort to his mind.)

He then makes three claims based upon what he thought he had invented.

1. "A yielding tread for a vehicle tire, having a peripheral succession of hard bearings embedded in the material of which the tread is composed and substantially flush with its surface."

2. "A vehicle tire treated in the same way, without a tread."

(Both of these claims count, of course, upon the metal studs, and are put first, although the specifications treat the subject in the reverse order.)

3. "A yielding tread for a vehicle tire, having metallic wire interwoven with the material of which the tread is composed so as to lie in part substantially flush with its surface."

There is nothing in the claim, it will be observed, covering the function of that portion of the wire lying flush with the surface after it has been worn away so as to leave exposed ends held in place by that portion of the woven wire which remains countersunk in the material of the tread.

These claims were rejected by the Examiner on a number of citations, and in December, 1895, Mr. Adams absolutely cut out any claim to his invention as respects the wire interwoven with the tread, and pro-

(Continued on page 406)

Muskogee, Okla.—Roberts Motor Car Co., under Oklahoma laws, with \$5,000 capital; to deal in motor vehicles. Corporators—A. B. Roberts, J. V. Thomas, E. J. Phelps, all of Muskogee.

Covington, Ind.—Auto Fast Delivery Co., under Indiana laws, with \$1,500 capital; to do an automobile transfer and livery business. Corporators—William E. Bilsland, M. Mayer, F. C. Allen.

Cincinnati, Ohio—Willys-Garford Sales Co., under Ohio laws, with \$10,000 capital; to deal in automobiles. Corporators—John N. Willys, G. W. Bennett, Walter Stewart, A. H. Smith, Tathbun Fuller.

Chicago, Ill.—Efficiency Electric Co., under Illinois laws, with \$100,000 capital; to manufacture electric batteries and electric supplies. Corporators—R. C. Carpenter, C. G. Johnson, W. J. Johnson.

New York City, N. Y.—United Garage Co., under Delaware laws, with \$100,000 capital; to operate a garage. Corporators—H. R. Shaw, G. F. Kinney, of New York City; B. W. King, of Brooklyn.

Indianapolis, Ind.—Indiana Die Casting Development Co., under Indiana law, with \$100,000 capital; to manufacture and sell die casting machines, etc. Corporators—E. E. Gates, J. L. Baker, W. P. Herod.

East Cleveland, Ohio—Windermere Garage Co., under Ohio laws, with \$5,000 capital; to operate a garage and salesroom. Corporators—W. H. Atkinson, M. J. Miller, K. F. Leet, O. F. Downes, R. A. Lang.

Boston, Mass.—Malley Motor Vehicle Co., under Massachusetts laws, with \$50,000 capital; to manufacture and deal in automobiles and other motor vehicles. Corporators—C. A. Malley, M. R. Hatch.

St. Louis, Mo.—Overland Automobile Co., under Missouri laws, with \$10,000 capital; to do general automobile business. Corporators—H. D. Condie, 98 shares; T. L. Housmann, C. P. Eberle, 1 share each.

Warrensburg, N. Y.—The International Fritchie Co., under New York laws, with \$500,000 capital; to manufacture motor vehicles, etc. Corporators—D. O'Connor, A. Sheard, H. A. Fluckiger, all of New York City.

Bridgeport, Conn.—Elm Auto Co., under Connecticut laws, with \$25,000 capital; to deal in automobiles and maintain a garage and automobile livery service. Corporators—F. L. Mills, Thomas Morrissey, J. L. Green.

Chase City, Va.—Swift Motor Car Co., under Virginia laws, with \$1,000 minimum, \$10,000 maximum capital; to do general automobile business. Corporators—R. L. Jeffreys, B. R. Roberts, W. D. Wildman,

A. J. Moore, J. W. Swift, Jr., all of Chase City.

Elmira, N. Y.—La France Garage Co., under New York laws, with \$30,000 capital; to operate a garage and deal in motor vehicles. Corporators—A. W. La France, C. T. La France, A. W. La France, Jr., all of Elmira.

Buffalo, N. Y.—Barrett Motor Car Co., under New York laws, with \$10,000 capital; to deal in automobiles. Corporators—Frank Barrett, Alexander G. Hoeffler, Edward J. Meyer, Alfred A. Berrick, John F. Berrick.

Dayton, Ohio—Cadillac Motor Co., under Ohio laws, with \$30,000 capital; to deal in automobiles and other motor vehicles. Corporators—William Stroop, H. C. Homing, L. G. Bawers, H. W. McCord, William M. Matthews.

Cleveland, Ohio—The A. A. Davis Motor Co., under Ohio laws, with \$10,000 capital; to deal in automobiles. Corporators—Charles A. Rolfe, F. H. Grace, George A. Gunderman, Charles O. Lemmon, J. H. Kirkpatrick.

Cincinnati, Ohio—Guarantee Automobile Co., under Ohio laws, with \$10,000 capital; to do general automobile business. Corporators—Joseph Berning, H. O. Wendel, Herman Kirschner, William H. Jones, George A. Berning.

Chicago, Ill.—Chicago Business Car Co., under Illinois laws, with \$10,000 capital; to manufacture and deal in automobiles, automobile parts and accessories. Corporators—James G. Cronkite, B. E. Harris, Marjorie Dean Cronkite.

New York City—Rotary Pump Transmission Co., under New York laws, with \$200,000 capital; to manufacture and deal in pumps and transmission systems. Corporators—C. Townsend, C. R. Hoffman, G. A. Burckhardt, all of New York City.

Woonsocket, R. I.—Woonsocket Automobile Co., under Rhode Island laws, with \$5,000 capital; to manufacture automobiles, motor trucks, carriages and kindred vehicles. Corporators—Frederick S. Blackall, Rollin E. Ballou, both of Woonsocket; Louis V. Hubbard, of Upper Montclair, N. J.; Gordon Gordon, of New York.

Increases of Capital and Change of Name.

Green Island, N. Y.—Electric Omnibus Corporation, from \$1,000 to \$100,000.

Nashville, Tenn.—Southern Motor Works, from \$400,000 to \$600,000 and name changed to Marathon Motor Works.

Recent Losses by Fire.

Long Beach, Cal.—L. G. Stone's garage, West Tenth street, destroyed.

Louisville, Ky.—C. R. Mengel's garage in G street and one automobile destroyed. Loss, \$6,000. Caused by dropping a match in puddle of gasoline on floor.

Webb & Hogue are building a garage in Crockett, Texas.

J. H. Lee, of Corpus Christi, has opened a garage in Sinton, Texas.

A. H. Hoffman has opened a garage and repair shop at Red Hook, N. Y.

The Hartford Automobile & Boat Supply Co., of Hartford, Conn., has filed notice of dissolution.

M. J. Kane is building a one-story brick garage at West Fifth and Franklin streets, St. Paul, Minn. It will cost \$10,000.

A new repair shop has been opened at 1716 Grand avenue, Kansas City, Mo. Dienstberger and Hoch are the proprietors.

The agency for Auburn cars at Kansas City, Mo., has been taken over by a factory branch under the management of George F. Shoop.

W. H. Block has broken ground for a one-story garage on Bird street, near Vermont street, Indianapolis, Ind. When complete, it will cost \$3,000.

Mayor W. W. Hummel, of Gladstone, Mich., has purchased a large piece of property on Tenth street, Escanaba, Mich., and will erect a garage thereon.

H. M. Wolter has opened salesrooms in Folsom street, near Twentieth, San Francisco, Cal. He will handle the friction driven Lambert in the Pacific coast territory.

Charles Malley, formerly of the Boston branch of the Studebaker Corporation, has organized the Malley Motor Car Co., with headquarters in Boston, Mass. He has the agency for Warren-Detroit cars.

The Western Supply Co., of Omaha, Neb., has filed suit for \$1,655.30 against the Fremont Auto Co., of Fremont, Neb., alleged to be due on a bill for supplies furnished to the latter. J. M. Aaldrup is the proprietor of the defendant company.

Frederick C. Benson, a former member of the Benson & Hughes Motor Vehicle Co., of Rochester, N. Y., has filed a petition in voluntary bankruptcy for the purpose of getting rid of old debts contracted while connected with the company. His liabilities are given as \$3,000, while his assets are nil.

C. F. Stewart has been appointed general manager of the newly established Iowa state branch of the Studebaker Corporation, in Des Moines. The Van Vliet-Fletcher Automobile Co., which heretofore has been distributing E-M-F and Flanders cars in Des Moines, will be associated with the distributing branch.

Under the style Smith-Hoppe Co., a

new concern has "opened up" in Milwaukee, Wis., with J. A. Smith and A. C. Hoppe as the partners. A new garage is being built for them at the corner of Cass and Wisconsin streets, capable of storing forty-five cars. The company has the agency for Oldsmobiles and the Hupp-Yeats electric.

The Six Thirty Eight Tire & Vulcanizing Co., which recently was incorporated in Memphis, Tenn., has purchased the stock, fixtures and lease of the City Auto & Rubber Co., of the same city, and will continue the business at the old location, 22 South Fourth street. R. D. Foley, formerly owner of the Foley Automobile Co., is the general manager.

The Gibson Automobile Co. and the Fischer Automobile Co., both of Indianapolis, Ind., have been consolidated under the management of Cecil E. Gibson. The new company will occupy the Fisher building at Capitol avenue and Vermont street, while the former headquarters of the Gibson company on Massachusetts avenue will be retained as a branch store to handle accessories and sundries.

The Elm Auto Co., Bridgeport, Conn., incorporated last week with \$25,000 capital, has opened a garage on Elm street, near Harrison street. The building is of brick, three stories high and affords 14,000 square feet of floor space. It will shelter Mitchell, Pope-Hartford, Inter-State and E-M-F cars, as well as a taxicab and livery department. F. L. Mills is the president and general manager of the concern.

Consolidation has been effected between the C. T. Bartee Auto Co. and Jamison Brothers, both of Lafayette, Ind., under the style the Jamison Brothers Automobile Co., which will handle Chalmers and Ford cars. Clarence F. Jamison is the general manager, while C. T. Bartee will devote himself chiefly to Ford cars. A new garage capable of accommodating 200 cars is nearing completion and will be ready for occupancy during the first week of the current month.

Edward H. Jungclas, of the Jungclas Automobile Co., of Cincinnati, Ohio, has leased the corner lot on Mitchell avenue, near the Somersfield Apartments, where he will erect a salesroom and garage, at an estimated cost of \$15,000. He formerly was a partner with his brother, W. C. Jungclas, in the garage on Reading road and June street, but disposed of his interest last April. He will handle the Ohio electric for the present, but expects shortly to take on several gasoline cars.

Internal dissension in the Hupp Motor Sales Co., of Cleveland, Ohio, has led John

M. Rauch, the manager, to apply for the appointment of a receiver and for an order restraining the directors from canceling the company's contract with the Hupp Motor Car Co., of Detroit. Rauch alleges that the contract does not expire until September, 30, 1911, but that Fred Lane, president; A. H. Homan, treasurer, and John W. Peterson, one of the directors of the Sales company, have induced the Detroit manufacturers to declare it null and void.

Changes Among Prominent Tradesmen.

J. O. Wharton has been appointed district manager for the Willys-Overland Co., with headquarters in Dallas, Tex. Previously he was assistant branch manager of the Studebaker Bros. Co. of Texas.

Don C. McCord, former manager of the Marion Motor Car Sales Co., Indianapolis, Ind., has been made sales manager of the electric vehicle department of the Flanders Mfg. Co., of Pontiac, Mich. He assumed his new duties on Monday last.

Allen Kendall has been appointed eastern sales manager for Claire L. Barnes & Co., of Chicago and Detroit. Previously Kendall was sales manager for the Lumen Bearing Co., of Buffalo. Barnes & Co. have also appointed Walter Swain, for many years connected with the W. Bingham Co., of Cleveland, as their general representative for Ohio and Indiana.

F. L. Martin, who for the past three years has been secretary and sales manager for the Hartford Auto Parts Co., Hartford, Conn., has been made sales manager of the automobile axle department of the Sheldon Axle Company, Wilkes-Barre, Pa. W. J. Childs, the former sales manager, has resigned to become manager of the O. J. Childs Fire Extinguisher Co., Utica, N. Y.

E. H. Lowe, who organized the Fal Motor Co., of Chicago, and who since has been its secretary and general manager, has resigned those offices and retired from the active affairs of the company, in which, however, he retains a majority of the stock. W. B. Paulson succeeds him as secretary and E. H. Marhoefer, president of the company, will perform the duties of general manager also.

George H. Strout, for the past four years sales manager for the Apperson Bros. Automobile Co., of Kokomo, Ind., relinquished that position on the 1st inst., to become sales representative of the Grabowsky Power Wagon Co., of Detroit. He will make his headquarters in New York and will handle New York, New England, New Jersey, Pennsylvania, Delaware and the District of Columbia.

Mr. Manufacturer—All Deliveries of Remy Magnetos Positively Guaranteed

The Remy Electric Company is the world's largest institution devoted to the manufacture of magneto devices. This plant can furnish you larger quantities of magnetos on shorter notice than any firm in the world.

Have your dealers ever clamored for cars while you waited for magnetos?

Then you know what our guarantee means.

Many of the largest makers of motor cars have contracted with us for their 1912 ignition equipment.

The recent speed and endurance triumphs of cars equipped with Remy Magnetos have impressed prospective purchasers everywhere of the superiority of Remy Ignition. They realize that a magneto which gives perfect service under such exacting conditions will serve them best in everyday automobiling.

Remy Service pleases users of Remy devices everywhere. It is a valuable asset to dealer and manufacturer.

May We Serve You?

The Development of the Coupe.

Thus early it is made evident that the year 1912 will be characterized by a remarkable development of the inside-operated car, the coupe, in particular. The specimens which already have been brought to view are not only numerous, but without exception they are of strikingly attractive design and appearance, in fact, they incorporate more style and are suggestive of as much luxury as the limousine, which is too large and too ponderous to be of truly stylish exterior, however luxurious it may be within.

In the nature of things, the coupe is likely to cut into the demand for limousines, but the extent of the demand purely is problematical and its measure will be no less interesting than the coupe itself. Certainly, the car that promotes winter use is very much to be desired and is to be encouraged in every way possible, but whether the modern coupe proves to be

more than a town car remains to be seen. Essentially it is a town car and a car for use in inclement weather and, this being the case, it appears not to have occurred to all designers that unobstructed entry from the right hand side is highly desirable, if not absolutely necessary.

In many cities the law requires that vehicles always shall present their right hand sides to the curb when receiving and discharging passengers, which means that the car possessed of right hand control compels passengers to dodge or squirm around the steering wheel or walk into the street and enter from the left side. This sort of thing is bad enough in the case of touring cars designed for fair-weather use, but it will not add to the popularity of the inside-driven vehicle intended largely for the use of womankind during inclement weather.

Whether this factor will hasten the coming of left hand control is a pretty question, but at any rate, it is one that should not be permitted to escape the consideration of those who pin high faith on the future of the coupe; nor should they lose sight of the desirability of ample ventilation. A coupe can become a very "stuffy" vehicle on a hot day or on a muggy one, which makes it appear that a generous rear window will prove as grateful as windows in any other part of the car.

The Value of Agency Systems.

Few cars sell themselves, assertions to the contrary notwithstanding. Much talk is required to sell some of them; others sell readily enough on their merits and reputations, but, after all, the factor that decides the most thoughtful purchaser is not a car, but a man, and that man is the agent or dealer. Often it is not his argument that settles the matter, but the mere fact that he is on the ground. In other words, the thinking purchaser usually decides that an agent for the car he selects is a "handy man to have around the town." He can carry his troubles to him and always is sure of a helping hand.

It is the conscious or sub-conscious belief in what is called "service," and nothing better serves to illustrate the value of agents and the advantages of a well-developed agency system. The advantages recently were aptly remarked by a motorist to whom had come for advice regarding the purchase an old friend residing in a town far removed.

"Without hesitancy I advised him to purchase a car of the sort I was using," said this motorist in relating the instance. "It had given me splendid satisfaction, the makers were well established and the price was reasonable. My friend then informed me that there was no agent for the car in his home town or in its vicinity and I promptly retracted my advice. I counseled the purchase of a car that had a representative on the ground. Until that moment, however, I do not think I fully realized the value of an agent. I never had had occasion to think of it before."

Encouraging the Amateur Spirit.

Unless the American Automobile Association and the other sports-governing bodies are watchful the genuine sportsman—the amateur—the private owner—is likely to obtain a foothold in spite of them. The class for private owners which was included in the recent Wisconsin reliability contest is a small indication in that direction; the Prince Henry tour abroad is a very much larger one. In fact, the latter almost may be considered a protest against the trade-saturation of the sport. It was by far the most notable and most inspiring sporting event which ever has occurred.

Of course, the A. A. A. and its kindred organizations across the sea are doing nothing to discourage the growth of the amateur spirit, but they are doing nothing to encourage it. It may be that their machinery is so large and so ponderous that they are forced to woo the trade and its dollars, but whether or no this be the case it long has been a crying shame that they have failed to recognize that the only enduring sport is amateur sport.

As so often has been remarked, when trade attempts to make business of sport, it is only a matter of time before it abandons it. The shuffling incident to the revival of the Glidden tour and the failure of the trade to support that contest may do something to force home the truth on the A. A. A. For it began to look as if it must turn to the private owner as a matter of self-preservation, at least so far as its competition department is concerned; and it is devoutly to be hoped that the plain indication and the handwriting on the wall will not be permitted to go to waste. The private owner must be actively encouraged or the sport will fall on dreary days.

Racing aside, the A. A. A. should require, as the Motor World once before suggested,

that a class for private owners be included in all contests. It should require that the name of the driver and not merely of the car be given in each and every instance. In other words, it should encourage real sport and add to it that element of human interest which has been kept so far in the background. However good may be a car it is of small value unless its driver is of equal caliber. It is not proper to permit him to be effaced. Only half of the glory of any triumph belongs to the car. To refer to an entrant merely as "Speedfast No. 14," for instance, may be one way of obtaining publicity, but it is mighty poor sport and serves the sport no real good. It takes the human element out of it, and when the human element is gone little remains. Every man, however humble, should receive his due, and a sports-governing organization which by acts of omission or commission fails to give it to him is lax in its duty and merely trends to the undoing of the sport which it is supposed to direct and control.

The trade itself can well afford to encourage the amateur—the private owner—indeed, it is to its interest to do so. He constitutes their bulwark and his performance is of far more real value and influence than is the performance of any number of hired men. The fact should be plain to the trade, and since the A. A. A. leans so heavily on the Manufacturers' Contest Association and responds so readily to its suggestions and recommendations, the M. C. A. can perform a worthy stroke by conveying to the A. A. A. recommendations that will assist in the building up of the amateur spirit and in permitting the private owner to come into his own; indeed the M. C. A., the N. A. A. M., the Board of Trade and the other trade organizations can do much worse than draw on their respective exchequers for permanent or semi-permanent national trophies which will serve to bring the amateur into the open and to multiply his numbers.

One of the British trade journals assures its readers that "the magnitude of the Coronation motor parade simply 'knocked them' in New York." And it must be true, for fully ten New Yorkers were aware that there was such a thing as a "Coronation motor parade."

annually. While I don't expect to patrol Broadway for all that period, when the change of address comes, I'll give you due notice, so that copies can be sent me by the 'swiftest air line.'—L. H. Perlman, New York City.

BURMAN LOSES HIS "MEAL TICKET"

Mishap Enables Knipper to Capture Brassard at Philadelphia—Ringler Scores Thrice—German's Mixed Luck.

Robert Burman, "speed king," not only went down to defeat at the Point Breeze track, Philadelphia, Pa., on Saturday last, 29th ult., but he also lost his "meal ticket," the Remy Brassard. It is "still in the fam-

ily," however, as William Knipper, who, like Burman, is a member of the Moross racing stable, gathered it in. The race was the feature event of the meet and Knipper's victory assures him of an income of \$75 per week while he holds the trophy. Burman held it four weeks. Although defeated, and solely because of a trifling mishap, Burman later had the satisfaction of lowering the track record for the mile, in the presence of Berna Oldfield. Burman's time was 58 $\frac{1}{2}$ seconds against Oldfield's 59 $\frac{3}{4}$ seconds. The lion's share of the honors, however, was carried away by Harvey Ringler, a local pilot, driving a Mercer, who won three events.

The occasion was the annual midsummer racemeet of the Quaker City Motor Club. It brought out a large crowd, too large, in fact, for the officials to handle. At times the spectators thronged the course and at one stage the mounted police had to be called on to clear the track. But one accident marred the meet. This occurred late in the afternoon, when Charles Wiggins, mechanic for Harry Baker, who drove a small Metz racer, was thrown from the car, when his machine crashed into a fence and was piled into by the following cars. His escape was marvelous, as he fell in front of an approaching machine, which ran over his right side. He was taken to the hospital, where it was later said his condition was not believed to be serious.

Herbert Richter, a German driver of note, made his first American appearance in a big Opel machine, and figured conspicuously at the meet. He won one ten mile

In the five mile free-for-all, for the Brassard trophy, there were but three starters—Burman in his big Benz; Knipper in a Mercedes, and Richter in the Opel, which only arrived in this country a few days previous to the meet. All got away together at the crack of the gun, but Burman

man, in a Buick, scored the first runaway in the race for cars of 161-230 cubic inches; Vincent Paula (Abbott-Detroit), was second, and Harry Taylor (Metz), was third. Harvey Ringler (Mercer), a local man, was the victor in the other light car race—for cars in the 231-300 inch class—and he left DuClosne (Staver-Chicago) far behind. Robert Morton, in a Kline car, was third. Ringler's time was 11:17. He also captured the ten mile handicap from Hugh Hughes (Mercer), no other contenders remaining after Baker (Metz) and Richter (Opel) had suffered the accident.

In the ten miles special, Ringler (Mercer), again distinguished himself. Hughes (Mercer), and DuClosne (Staver-Chicago) fought him hard, and for the better part of the ten miles it was any man's race, although Ringler took the lead at the start and never lost it.

Summary:

Ten miles, 161-230 cubic inches—Won by Joe Grennon, Buick; second, Vincent Paula, Abbott-Detroit; third, Harry Taylor, Metz. Time, 12:27.

Ten miles, 231-300 cubic inches—Won by Harvey Ringler, Mercer; second, DuClosne, Staver-Chicago; third, Robert Morton, Kline. Time, 11:17.

Ten miles, 301-450 cubic inches—Won by Herbert Richter, Opel; second, Harry Cobe, Jackson. Time, 12:19 $\frac{1}{2}$.

Ten miles, special—Won by Harvey Ringler, Mercer; second, Hugh Hughes, Mercer; third, DuClosne, Staver-Chicago; fourth, Grennon, Buick; fifth, Wenkler, Kline. Time, 11:39 $\frac{1}{2}$.

One mile time trial—Robert Burman,

RINGLER (MERCER) RUNNING AWAY WITH THE TEN MILES HANDICAP

WHEN THE MOUNTED POLICE HAD TO CLEAR THE TRACK

took the pole at the first turn and held his lead until the fourth mile, when a broken rocker-arm, which prevented the flow of gas, put him out of the running. Knipper then assumed the leadership and finished nearly a quarter of a mile ahead of the man from Germany, in 5:34 $\frac{1}{2}$.

The first two races of the day were uneventful, the winner going to the front at the crack of the gun and remaining there, winning in each case by at least a half a mile. Joe Grennon, mechanic for Bur-

time, 58 $\frac{1}{2}$ seconds. Previous track record, 59 $\frac{3}{4}$ seconds.

Five miles, free-for-all, for Remy Brassard—Won by Knipper, Mercedes; second, Richter, Opel. Time, 5:34 $\frac{1}{2}$.

Ten miles, handicap, open—Won by Harvey Ringler, Mercer; with handicap of 30 seconds. Time, 10:49. Second, Hugh Hughes, Mercer, scratch. Time, 10:39 $\frac{1}{2}$.

Twenty-five miles, free-for-all—Won by Hugh Hughes, Mercer; second, Harvey Ringler, Mercer. Time, 27:24 $\frac{1}{2}$.

BUT ONE FAILS TO REACH HELENA

Eighteen of Nineteen Starters Survive Real Reliability Contest—Five Clean Scores—Incidents of Closing Days.

Helena, Mont., July 30.—Covered with mud and filled with enthusiastic motorists, 18 of the 19 automobiles which started from Minneapolis on the 20th inst., in the third annual reliability run of the Minnesota State Automobile Association rolled into Helena, Mont., on the evening of Friday, the 28th, under their own power, the 19th car, the Amplex, driven by Philip Wiseman, also rolled in, but it was aboard the Great Northern "automobile train," having been withdrawn by its owner the previous day.

That the tour was not a "joy ride" in any sense of the word is evidenced by the fact that but five of those who started were able to keep their slates clean to the end of the trip. Of the remaining 13, two, F. A. Witt's Flanders and Wiseman's Amplex, were withdrawn, though both finished the run, the Amplex, as noted, aboard the "automobile train," and the Flanders under the guiding hand of its driver, and 11 finished with penalties ranging from three to 461 points. The complete scores are as follows:

Touring Car Class—Registered Division.

Driver and Car.	Score.
Bohn Fawkes, Marmon.....	995
A. N. Smith, Abbott-Detroit.....	994
M. J. Armstrong, Colby.....	992
O. A. Palmlund, Halladay.....	956
J. H. Prior, Stoddard-Dayton.....	825
P. Wiseman, Amplex.....	Withdrawn
Touring Car Class—Unregistered Division.	
C. L. Bonwell, Kissel.....	Perfect
Chris. Rice, Kissel.....	Perfect
J. Sackow, Pierce-Arrow.....	Perfect
W. Stork, Packard.....	Perfect

Runabout Class.

B. W. Scott, Flanders.....	Perfect
George Herron, Flanders.....	Perfect
B. T. Hoyt, Cole "40".....	992
A. J. Rose, Cole "30".....	539
E. B. Stimson, Hupmobile.....	990
O. W. Close, Maxwell.....	858
A. L. McNurlen, Petrel.....	782
J. E. Dougherty, Krit.....	1046
F. A. Witt, Flanders.....	Withdrawn

Despite the assertions of Reuben Warner, Jr., president of the Minnesota State Automobile Association, to the effect that if either of the two Kissel entries, or the Pierce-Arrow entry, all of which were without the necessary A. A. A. registration certificates necessary to make them eligible as stock cars, finished with scores which entitled them to prizes, he, Warner, would see that they got them, certificates or no certificates, they were overlooked when the time came to hand out the prizes, and as

there have been no protests up to date it is unlikely that the prizes will be taken away from those to whom they were awarded.

To Bohn Fawkes, Marmon pilot, went the coveted Minneapolis Journal trophy for the driver of a touring car who finished with the best score. Fawkes's total debit was five points. The Reuben Warner, Jr., trophy, which was the second prize for cars in the touring car class, was awarded to M. J. Armstrong, who drove a Colby. In the runabout class the two Flanders cars, driven by B. W. Scott and George Herron, both finished with perfect scores, and the drivers were awarded the Phillips trophy and the Jesse Gregg trophy, respectively.

Almost perfect weather conditions prevailed on Wednesday, 26th ult., when the tourists left Culbertson, Mont., on the last leg but two of their long journey. In the morning the weather was slightly cloudy, but in the afternoon nothing interfered with the bright glare which finished the work the wind and heat had been doing in taking off the rest of the cuticle from the faces of the tourists. The route from Culbertson to Malta, which was designated as the night control, was long and hard—183 miles—across the prairie, with nothing but sage brush, cactus fields, prairie dog villages and millions of glacial drift pebbles to cheer or harass the motorists. Nevertheless, little or no trouble outside of punctures and blow-outs was encountered. Though a boxing match, as part of the evening's celebration, was put on at Malta for the edification of the tired travelers, some of the elite of that Montana town arose in wrath at the degradation, and it was stopped in the sixth round of a scheduled ten-round mill.

Thursday, 27th ult., saw the procession well on its way toward Great Falls, the next to the last leg of the journey, and the longest single day's run of the tour. It is 210.6 miles from Malta to Great Falls, Mont. Rain in the form of a veritable cloudburst, which came late in the evening of the previous day, put the roads in horrible condition, and as a result trouble commenced early. Slipping and sliding the motorists wended their way toward their distant goal, and the number of punctures and other tire troubles which were sustained was almost appalling. Smith, in the Abbott-Detroit, had no less than 14 blow-outs, and some of the other drivers suffered almost as badly.

The Flanders, driven by F. A. Witt, broke a valve during the day, and though it continued with "the bunch," and under its own "steam," it was withdrawn. Wiseman's Amplex also was withdrawn, trouble having developed with the oiling system, and it was placed on one of the special cars in the "automobile train" to continue its journey in silence. The reason for the exceptionally long day's run was to avoid the necessity for going through a lot of mud, but as the route as laid out led over a lot of prairie without the least semblance

of a road and was extremely rough, it was the opinion of not a few that if the route had led through the mud, and thereby been 30 miles shorter, there would have been fewer broken parts and more clean scores.

O. A. Palmlund's Halladay car, which acted as the pacemaker and carried the confetti, broke a hub casting, and its burden of pilot and confetti were transferred to Armstrong's Colby. Later, tire trouble necessitated a further shift of the pilot and his paraphernalia to the car of a non-contestant. The Halladay was put in shape in a little over three hours and continued the journey.

The last day of the tour was at once the shortest and the most pleasurable. Leaving Great Falls at 10 in the morning the tourists traveled an easy 110 miles, mostly over good roads, through picturesque canyons and over the mountains of the Prickly Pear district. Prairie dogs were the chief source of entertainment in the low lands. The motorists passed through one "village" which was almost a mile long, both sides of the road being lined with the little rat-like animals and their associates, the little owls. The rattlesnakes, which generally are to be found in company with the prairie dogs, failed to put in an appearance.

Not a single mishap marred the pleasures of the last day, and when the tired and dusty tourists checked in in front of the Broadwater Hotel at Helena no additional penalties had been charged. Stimson's Hupmobile had two points more than it had when it left Great Falls, but these were earned on the previous day, the cause being the taking on of water outside of control.

Practically every one in Helena who was able to be up and about gathered in front of the hotel as the checking-in process was going on, and gave the visitors a rousing welcome. Later, there was a banquet in their honor and speeches and other things which go to make up the celebration which generally is accorded a body of touring motorists on the completion of a long tour. Louis W. Hill, president of the Great Northern Railway, and his special train left for home next morning and carried many of the tourists and their cars. Others preferred to stay at Helena for a time, and still others started on supplementary tours through the Yellowstone Park.

Not all of the prizes went to the contestants. For the best roads which were encountered in the State of Montana, Lewis and Clark County was awarded the Louis W. Hill trophy which, having been won twice, becomes the permanent property of that county. Grand Forks County, which is in North Dakota, received the Sullwood trophy for the best roads in that state, and this trophy also now will remain with the present holders. The trophy put up by the Devils Lake Commercial Club for the best roads westward from that city to the state line of North Dakota, went to Ramsey County.

GLIDDEN TOUR TO GO TO FLORIDA

Canadian "Resurrection" Failing, Southerners Prevail—Easy Conditions, but Cash Prizes Will Create Many "Pros."

That big "if" which entered into the proposed resurrection of the Glidden tour "some time in September" proved almost so large as to be overpowering. The "some time in September" was to have been changed to something more definite—if 30 entries were received by Tuesday last, 1st inst. They failed to appear, however, and as a result the so-called "reciprocity tour" from Washington, D. C., to Ottawa, Can., is off for all time. Instead, the time of the tour has been changed to "some time in October," and it will go South, not North, and though it still will be a Glidden tour in name, the resemblance will end there.

It is to be a Grade IV. contest, which, according to the American Automobile Association rules governing reliability runs, means that penalties will be imposed for lateness at controls only, the cars carrying no observers, and the course will be over the route of the proposed National highway between New York and Jacksonville, Fla., via Atlanta, Ga. A big bid will be made for private owners, although on the surface the tour is open to professional drivers only as the promoters wittingly or unwittingly have offered as an additional "inducement" "a \$200 cash prize for the best performance in each of the seven price divisions." Inasmuch as the rules of the A. A. A. state that an amateur is "a man who has * * * never competed for a cash prize," the tour is likely to produce a lot of professionals, whether or no.

It has been known for some time that the South wanted the Glidden, even after the route from Washington to Ottawa had been laid out, and arrangements for the trip Canadaward made, and the present plan to journey southward scarcely is a surprise. The decision was reached after a conference yesterday (Wednesday) between Chairman Butler of the Contest Board of the A. A. A. and representatives from the Atlanta Chamber of Commerce and the Jacksonville Board of Trade, and though the impetus which will be given to good roads progress in the South and the desirability of going in that direction rather than Northward at that time of the year are given as the reasons for the change of route it is probable that the principal reason for not abandoning the whole project was, to quote an official of the three A's, "that the American Automobile Association was desirous of running some sort of a tour, Glidden or otherwise, in order to recoup its losses sustained in preparing for the Glidden as originally scheduled."

Be it said to its credit, however, that the new plan under which the resurrected Glid-

den will be run really comes nearer to the original intention of the donor of the trophy than ever before, in that the tour was and is intended primarily to interest the private owner rather than the manufacturer. The entry fee has been placed at \$25, which is just \$475 less than has been charged in years gone by, and the owner of any stock car is eligible to enter.

Shrinkage of 10,000 Cars in Iowa.

That the various "estimates" of the number of automobiles running on American roads, which have appeared from time to time in the daily press and also in some of the more gullible trade journals, have been taken far too high and should be reduced by at least 30 per cent, again has been made evident by the recent experience of the state authorities of Iowa. Like many other states, Iowa this year passed a law providing for annual registration of its motor vehicles, and ordered 30,000 number plates for distribution to the supposed 30,000 automobile owners. But when it came to the distribution it was found that only 16,400, or barely more than one-half, were required; and even allowing for the coming additions during the remainder of the year it is not thought that more than 20,000 plates will be needed. The state of Iowa alone, therefore, registers a loss of fully 10,000 automobiles from the "estimated" number, and as nearly all the other states have had similar experiences—or are due to have them as soon as they start the system of annual registration—the 500,000 automobiles said to be running in this country will have to be brought down to about 350,000, which is probably far nearer the actual number than the half-million—although it may not sound anywhere near as important.

Ten Days' Chicago-Detroit Truck Test.

According to present indications at least 40 commercial vehicles will start from Chicago on Monday next, 7th inst., in a reliability run, which embraces 750 miles of all kinds of city and country roads between that city and Detroit, Mich., and return. That number of entries has been received for the event, which is being promoted in blanket by Hearst's Chicago American and in specific by the Chicago Automobile Club and the Wolverine Automobile Club of Detroit. The purpose of the run is to determine the cost per ton mile of transporting goods by motor truck, and all of the contesting trucks will be required to carry loads up to their catalogued capacity, either in bona fide merchandise or in sand ballast, entrants having the option of carrying either. Ten days will be required to make the run, thereby allowing for a daily average of 75 miles, with stops in all of the principal cities and towns en route. South Bend, Fort Wayne, Logansport, Lafayette, Lima, Toledo and Battle Creek are among the principal cities which will be visited on the route.

TWO NATIONS EXCHANGE PRIZES

England Wins Prince Henry's Trophy, But British and German Rulers Render Honors Easy—To Repeat Contest.

As had been predicted after the loss of De la Croix's car from the German contingent, caused by its running into a farm wagon at high speed and entailing a debit of 450 points, the British team was awarded the big ivory trophy, presented by Prince Henry of Prussia to the winner of the international tour that bore his name.

With impressive ceremonies, during the banquet at the R. A. C. on July 20th, the statuette was handed over by the Prince to the Duke of Teck, president of the Royal Automobile Club of Great Britain, which organization will hold it for a period of one year, when it will again be fought for in an international contest over the roads of at least three countries, Germany, Austria and Italy, probably extending even into Hungary and Russia.

In order that every one might return satisfied to his home, four other cups were awarded. A handsome silver trophy, presented by the Emperor of Germany, going to the Royal Automobile Club for "keeps"; another silver cup, offered by King George of England, was carried away by the Kaiserlicher Automobil Club, also as a permanent souvenir; a third cup, given by the German Empress for the handsomest British car, went to the Rolls-Royce of Mr. Clark Neill, while the fourth prize, tendered by the British Queen to the most elegant German car, was given to the Opel, driven by Landrat von Marx. Prince Henry's own Benz gave the Opel a close race for the latter award, as far as beauty of outline and equipment was concerned, but had to be satisfied with "creditable mention."

Little of unusual incident occurred on the last four days of the tour on English soil. The reception of the tourists by the populace was extremely cordial throughout, no accidents of serious nature were recorded, and the whole tour more and more took on the form of a triumphal march, with enthusiasm and fraternization banquets punctuating every stopping place, the presence of so many real sportsmen and the entire absence of professional chauffeurs and trade and advertising features marking an agreeable innovation.

In conformity with the rules no official penalization figures have been given out, nor has the total number of points of the winning team been published.

Lindsay Heads New Club in Texas.

Twenty motorists of Denison, Texas, have organized the Denison Automobile Club, with the following officers: President, B. J. Lindsay; secretary, William Esler; treasurer, H. E. Pearce.

NATIVE GETS SOME OF THE GLORY

Indianapolis Cracks "Invade" Cincinnati's Hill Climb and Gather Spoils—Radina Keeps One Prize at Home.

The drivers of National cars had a gala day on Saturday last, 29th ult., at the Cincinnati (Ohio) Automobile Dealers' Association's hill climb. They were first in two out of the eight events and second in three more. But they were not quite the whole show, however, as Joe Dawson in his Marmon and F. E. Radina, a local driver, who drove a "home-made" Cino, each shared the spotlight. In fact, Radina turned up the real surprise of the day—despite the fact that Wilcox, who drove a National, set up a new record of 25½ seconds for the course—when he beat Aitken in his National by almost three seconds in a free-for-all in which the cars were loaded with four passengers.

Stanley avenue, which is in the East end of the city, was the hill on which the contests were held; it measures just 270 feet short of half a mile and the average grade is 11 per cent. In preparation for the meet, heavy wire cables were fastened at the sides of the course and spectators were given to understand that they passed the ropes at their peril. Consequently the course was kept unusually clear and there was not even the semblance of an accident, though the crowd which gathered was the largest which has turned out in some time.

Following the usual custom, the curtain raiser was for cars in the "baby class," that is to say, for cars having less than 161 cubic inches piston displacement. E. Stone made the ascent in an Empire "20" in 51½ seconds, winning the event, with L. H. Sacket (Flanders "20") second in 58½. H. Bauer, in an Oakland, got up the hill in 40.2 seconds in the next larger class, but the best his only competitor, W. Hambly (Elmore), could do was 48 flat. After the next event, which was won by Dawson, with Raimey in a Cino second, everything except an event for club members and the free-for-all, in which the cars were required to carry four passengers, both of which went to Radina, was carried off by National pilots, Aitken getting the 301-450 class and Wilcox getting the 451-600 class and the "grand free-for-all." The summary:

Class C, nonstock, 160 cubic inches and under—Won by E. Stone, Empire, time 0:51½; second, L. H. Sacket, Flanders, time 0:58½.

Class C, nonstock, 161 to 230 cubic inches—Won by H. Bauer, Oakland, time 0:40.2; second, W. Hambly, Elmore, time 0:48 flat.

Class C, nonstock, 231 to 300 cubic inches—Won by Joe Dawson, Marmon, time 0:28½; second, J. Raimey, Cino, time 0:32 flat.

Class C, nonstock, 301 to 450 cubic inches—Won by J. Aitken, National, time 0:29½; second, Joe Dawson, Marmon, time 0:30 flat.

Class C, nonstock, 451 to 600 cubic inches—Won by H. Wilcox, National, time 0:25½; second, H. C. Dixon, Matheson, time 0:39½.

For Cincinnati Automobile Club members only, owners driving and cars carrying four passengers—Won by F. E. Radina, Cino, time 0:38½; second, Charles Schier, National, time 0:40½.

Free-for-all for cars with bodies and fenders and carrying four passengers—Won by F. E. Radina, Cino, time 0:36½; second, J. Aitken, National, time 0:39½.

Grand free-for-all—Won by H. Wilcox, National, time 0:25½; second, J. Aitken, National, time 0:28½.

One Way to Solve Tail Lamp Problem.

After experiencing endless annoyance through the carelessness of cyclists when riding at night, the Automobile Association and Motor Union, of Great Britain, have decided to distribute broadcast ten thousand tail "lights" of the type which consists of a small mirror covered by a ruby lens. When a cycle equipped with one of the devices is approached from the rear by a car, the light from the headlights is reflected in a red glow, like that of a ruby lantern. By making an extensive free distribution of the signals, it is hoped that their adaption may become general and night driving thereby rendered considerably safer. The idea originally was conceived by a local club in an English town, which presented to the municipality a number of the "lights" for use not merely on bicycles but on horse-drawn vehicles, as well.

Alco Organizes a Racing Team.

The Alco racing stable, which formerly comprised a single car, "old No. 18," with which Harry Grant twice won the Vanderbilt cup, has been enlarged, and for 1912, at least, will include two more cars, which will be driven by Harry Hartman and Frank H. Lee, the latter being Grant's erstwhile mechanic. It will be the first time the American Locomotive Co. has gone into racing in the true sense of the word. One of the three Alcos at least will be seen in every important event to be held. The first appearance of the triumvirate will be at the stock chassis road championships at Elgin, Ill., on August 25 and 26.

Amery Motorists Get Together.

The motorists of Amery, which is in Wisconsin, have formed the Amery Automobile Club. The officers for the ensuing year are: President, H. B. Pennington; vice-president, H. B. Commett; secretary and treasurer, George W. Miller; directors, E. J. Schneider, J. G. Burman and W. T. Kennedy.

MINISTER PROMOTES A RACEMEET

Toronto's "Athletic Parson" Adopts New Means of Raising Church Funds—Mixes Dog Races and Motor Contests.

The Rev. J. D. Morrow, who hails from Toronto, which is across the border in Canada, is affectionately styled the "athletic parson" by his large flock, the reason for the appellation being his love for athletics and that he occasionally promotes contests of various sorts, and just as often they are complete successes, at least from the point of view of the treasurer of the Dale Presbyterian church, whose coffers always are replenished by one of "Morrow's meets," as they have grown to be known. On Saturday last, 29th ult., he fathered his latest venture, the site being the half-mile oval at the Toronto Exhibition grounds, and though the program included such novelties as a baby show and a whippet race, the principal interest centered in the automobile contests.

Sandwiched between bicycle races, motorcycle races and the dog race, were three events for automobiles. Two of them were at five miles and were restricted to 20 horsepower cars, and the third was open to all, the drivers being required to make one circuit of the course and dodge eight barrels en route. Morrison, at the wheel of a Hupmobile, proved best in the first five miles struggle, and Ricketson, who had the mount on an Overland, was second, the winner's time being 7:42. Ricketson also was second in the other five miles event, Saurenson in a Ford nosing him out for first honors almost at the post. Saurenson's time was 7:14½. McDonald, guiding a Ford, was the cleverest dodger in the last event and he carefully missed all the barrels and completed the circuit in 1:48½. Morrison, winner of the first race, was second in his Hupmobile. The summary:

Five miles, for 20 horsepower cars—Won by Morrison, Hupmobile; second, Ricketson, Overland. Time, 7:42.

Five miles, for 20 horsepower cars—Won by Saurenson, Ford; second, Ricketson, Overland. Time, 7:14½.

One half mile novelty race, drivers to dodge eight barrels—Won by McDonald, Ford; second, Morrison, Hupmobile. Time, 1:48½.

Sac City Now Has a Club.

Sac City (Iowa) motorists have organized an automobile club which will affiliate with the Iowa State Automobile Association. The officers are: President, J. J. Harter; vice-president, B. F. Holmberg; secretary, J. R. Slacks; treasurer, George B. Perkins; executive committee: the president, the secretary, Ira Conger, Cleve Pilcher and F. S. Needham; delegate to the state association, Charles L. Early.

FRENCH TRUCKS TRY FOR SUBSIDIES

Ministry of War Now Putting Them Through Month's Test — Fourteen Vehicles Fail to Survive First Half.

Fifteen manufacturers of motor trucks are represented in French military subsidy road trials, which at present are being held under the management of the French Ministry of War. The trials began on July 15

ble of going through the heavy work without serious mishaps.

Fifty-eight cars, affording a great study in contrasts, were presented to the authorities, were examined and marked and sealed by officers, and then dispatched on long journeys, loaded to capacity with stores and ballast. Arrived at their destination other officers would examine the seals, make reports of the time, character of roads covered and condition of the tires, radiators, etc., and then send them back to the orig-

to details which characterized the examination are suggested by the accompanying illustrations. The tire equipment, in particular, will be watched closely.

The severe demands caused the withdrawal of several of the contesting trucks in the first few days, but 44 or them have surmounted all obstacles which the first half of the contest presented, and are giving a splendid account of themselves. Those who have qualified so far are: 4 Saurers, 4 Peugeots, 6 Berliets, 4 Delahayes, 4

GENERAL VIEW OF FRENCH TRUCK TRIALS UNDER THE AUSPICES OF THE MINISTRY OF WAR

and will continue until August 13. The purpose of the tests is to fix the amounts of subsidy given to certain manufacturers whose trucks prove serviceable and capa-

ble of going through the heavy work without serious mishaps. Day after day, for four weeks, the trucks have to go over good and bad roads, and in some cases even across country. The thoroughness and attention

to details which characterized the examination are suggested by the accompanying illustrations. The tire equipment, in particular, will be watched closely. The severe demands caused the withdrawal of several of the contesting trucks in the first few days, but 44 or them have surmounted all obstacles which the first half of the contest presented, and are giving a splendid account of themselves. READY MEANS OF FILLING FUEL TANKS

MARKING THE PARTS FOR IDENTIFICATION

IMPROVEMENT OF THE SPARK PLUG

It Has Reached Such a State That Further Betterment Seems Improbable—Eccentricities of Early Plugs.

Discovering what he is pleased to term a "lull" in the influx of spark plug and other ignition devices, a well-known British authority has been moved to speculate as to the cause of the apparent lack of activity in this formerly seething pool of development, ultimately arriving at the conclusion that the original shortcomings with spark plugs in particular arose not so much from inherent structural faults as from external frailty coupled with troubles having their seat in other portions of the engine.

"It is now some time since the lull was started," continues the authority in question, who is none other than Mervyn O'Gorman, a familiar contributor to the motoring press, "and the reason for this stoppage and for the previous plenitude of patents in this branch is worth some consideration.

"In an automobile competition several years ago the mechanic in charge of a certain car under observation actually changed 31 sparking plugs in a run of 100 miles, while on another car the plugs, which emanated from the same factory, were not exchanged for those originally in the engine. The majority of competitors, however, replaced several plugs, as, indeed, every motorist did in those days. Then, as now, almost any sparking plug which had worked for an hour at full power would work for an almost indefinite period if only the distance between the points was adjusted at long intervals, in order to compensate the slight burning away due to the temperature of the metal. When, however, the sparking plug hole was the only means whereby it was possible to make an inspection, to examine valves, to inject petrol, and to observe the state of the cylinder head, the constant screwing in and out of the plug, for which great force was used since a gas-tight joint was required, led to its being damaged. This damage, being hard to detect, led to general complaints and to an expenditure on the purchase of plugs which appeared to warrant the production of new varieties.

"To-day it is necessary to recall that valves or their springs were inspected almost daily—that petrol was injected at almost every start, and that the leakage of compression round the sparking plug was a matter which seriously exercised the motorist's mind before he started a journey in his automobile. The outcome of this was the presence of the spanner, muscularly wielded about the engine head. The sparking plug was often very good, but it

had usually a very long and delicate porcelain projection which was cracked without being snapped off, owing to the central wire which held it together. Men were not skilled at identifying which cylinder was missing fire, and so the plugs were removed in lots of four or two, according to the number of cylinders. It must not be thought that this explanation of the chief reason for the wastage of sparking plugs excludes the many other minor causes of trouble with this piece of apparatus, but it is clear that those electrical engineers who understood when they took up motoring what was to be expected of plugs had far less trouble with them.

"One of these men, who has had seven cars and two or three motorcycles, reports that he never had trouble with any plug which had once worked well, save that which he discovered was due to a cracked porcelain, or the deposit of a drop of oil between the spark points, a common cause of trouble which certainly was not cured by the use of a new plug, the bending of the spark points by contact with the inlet valve head, the turning round of the points to a wrong distance or gap by the clumsy tightening of the binding screw, or the short-circuiting of the points by a bridge of carbon. All these causes of trouble may be cured by attention to the plug rather than by condemning it, though the latter course was generally adopted a few years ago.

"The chief improvements of to-day in plugs are—(1) the use of nickel as the non-fusible metal which constitutes the points; (2) the firm formation of the plug, so that the points cannot be moved inadvertently; (3) the provision of a cushion under the porcelain to allow of the expansion of the metal stem; (4) the use of short, stout, and strong porcelains, glazed in such a manner as not readily to take a deposit of water. But the plug which was advertised to add 15 per cent. to the power of the engine has not yet proved itself, nor is it likely to do so."

Motor Truck "Makes Good" in Army Test.

Following an extensive test in which nearly 1,000,000 pounds of subsistence stores and property has been hauled, to say nothing of some 500,000 pounds of beef, vegetables and flour, Gen. T. E. Bliss has reported on the cost of operation of a two-ton truck that was purchased by the United States army for use in connection with an experimental rolling kitchen. Gen. Bliss has been in command of the provisional brigade at San Diego, Cal., where the supervision of the automobile test has been included in his duties. The motor truck was found to have an advantage in first cost of \$664, as compared with the equivalent animal equipment of three escort wagons, twelve mules and harness. In the cost of operation for 93 days the difference in favor of the truck amounted to \$372.

"From a military point of view," says

General Bliss, in reporting the outcome of the test, "the advantages arising from shortening the line of march, from the absence of horses, from the ability to send the trains on long detours, thus insuring their safety and at the same time with the certainty of their being on hand when wanted are obvious. In my opinion the time has come for the adoption of a motor truck specially designed for military service and its gradual substitution for the greater part of the work done at present by escort wagons."

How Memphis Uses Garbage Wagons.

With a capacity equal to that of fourteen mule carts of the kind used at present in Memphis, a new motor garbage wagon, installed by the Department of Health in the Tennessee city, has greatly facilitated the work of that department. The plan under which the new cart works is quite a novel one. The mule carts are retained, as formerly, in the work of collecting the garbage along their regular route, where stops are very frequent and very slow driving a necessity, but instead of being driven, when loaded, to the general dumping point at the crematory, they now dump their refuse at specified locations into the big motor car. As soon as the big cart is filled, it starts at high speed for the crematory, where it drops its load; it then is driven back to the next collecting point. In this way the work of the mules is restricted to the gathering of garbage within a comparatively small territory, and the instalment of the new truck is said to have doubled the efficiency of the garbage collecting service.

Motor Trucks' Part in "War Game."

Accompanying the two militia "armies" which industriously are playing the war game in the vicinage of Boston are two Kissel one-ton trucks, which in itself is not extraordinary, inasmuch as motor trucks have on more than one occasion assisted materially at army maneuvers. But it is extraordinary in that these two trucks are equipped with complete wireless telegraphy outfits, by means of which the commander in chief and his aides are kept in constant communication with each other. The apparatus which is carried and which embraces in addition to the necessary instruments, etc., large reels of wire for use with the ordinary variety of telegraph and telephone, is independent, which is to say that dynamos for generating the necessary current are included in the outfits.

Indianapolis to Buy Fire Apparatus.

Indianapolis has appropriated \$45,000 for the purchase of motor driven fire fighting apparatus, with which three new companies will be equipped. In an effort to secure the contract, one of the Detroit automobile companies last week took a number of city officials from Indianapolis to its factory in Detroit, paying the entire expenses of the party.

THE E-M-F AND THE FLANDERS CARS

Wherein Those Surprising Values Have Been Enhanced for 1912—Their Prices, However, Remain Unchanged.

Having enjoyed a conspicuous position in the automobile industry by reason of the high quality of construction offered per dollar of investment, the E-M-F cars are now destined to attain further distinction as the first of the low-priced class to be furnished with demountable rims as standard equipment. That such is the case appears

ed on the same chassis as the touring car and is designed especially for the use of buyers who have occasional requirement for utility service. The coupe model also will be continued. With the exception of this type, the price of which will be \$1,475, the line will list at \$1,100, including oil and gas lamps, generator, horn, tools and magneto equipment.

In respect to the alterations in chassis construction that are involved in the new product, probably the most conspicuous are the lengthening of the wheel base to 112 inches, thus affording about four inches more room in the tonneau, the employment of a drop frame, which lowers the center

style of finish and equipment will be improved in minor ways.

The "three-speed" Flanders 20 line will be continued with the closed-front body construction and structural improvements that were announced early in the present year. The closed-front touring car accommodates five passengers and is suitable for suburban as well as light touring service. It sells for \$800. The so-called suburban and the runabout models are listed at \$800 and \$750, respectively. The former is built with detachable rear seat, thus being made suitable for light haulage purposes, while the runabout has the skuttle dash and general air and appurtenances of the larger

FLANDERS 20 RUNABOUT WITH COMPLETE EQUIPMENT

from an announcement which just has been made by the Studebaker Corporation, among whose varied products the E-M-F and Flanders lines are included. While retaining the general character which has distinguished them from the beginning, the new line of E-M-F cars has been subjected to sundry changes in detail which are calculated to render it even more noteworthy both in appearance and utility than before.

To the standard closed-front touring car,

of gravity and tends to render the machine easier riding, and the lengthening of the springs. The brake rods are now carried inside the frame, the throttle and spark control levers have been placed above the steering wheel for the convenience of the operator and by the same token the gear shifting and emergency brake levers have been mounted inside the body in every case. The car thus is slightly larger than before, despite which fact, its weight is not

E-M-F. All three body styles are mounted on the improved Flanders three-speed chassis.

Condenser Idea in a Spark Plug.

By the use of a "button-head" terminal the Best Ignition Equipment Co., New York City, has evolved a spark plug in which a broad combination of virtues are believed to be embodied, chief among which are oil-proof and condenser quali-

NEW E-M-F TOURING CAR WITH DEMOUNTABLE RIMS

ties. The button-head is designed to retain a sufficient amount of heat to ensure the drying up of the oil, thus preventing it from bridging the gap and causing a short-circuit. Such is its structure that it also acts as a condenser, it is said, thus intensifying the spark. Insulation extending all the way to the sparking surfaces, a method of permitting the electrode to expand and contract without bringing pressure to bear on the porcelain, and a construction which permits the plug to be disassembled and re-assembled are other of its features.

The detachable tonneau model is mount-

as great, due to careful distribution of material at points where it will do the most good.

In fitting out the line particular attention has been paid to the matter of equipment. The closed-front bodies are provided with ventilators, in addition to which the front doors are devised in such a way that they can be latched in a slightly open position during hot weather, the result being to ensure a good circulation of air through the front part of the body. Special headlights of liberal size will be used, and the general

WHEN SERVING THE LAW WAS COSTLY

Connecticut Chauffeur Pays Fine for Obeying Sheriff—Queer Tangle Involving Seizure of a Car.

Chauffeuring for a deputy sheriff is not always profitable, at least that is what Joseph Young, of Bridgeport, Conn., thinks, as he was assessed \$10 by a local judge for an alleged violation of the state law by not having his license tag on the car. It appears that George H. Platt, an automobile dealer in the Connecticut town, did some business regarding a car with one Otto Fisher, of Norwalk. Fisher did not come across with the money very rapidly and Platt placed the matter in the hands of an attorney.

Sheriff Wieler, armed with the property papers, hid himself via motor to Norwalk, taking Young, who is a regularly licensed chauffeur, along. After attaching Fisher's automobile he told Young to drive it back to Bridgeport and he would follow in another car. The chauffeur was also instructed to wait for the sheriff at a place near Norwalk, but the latter did not arrive soon enough and Young continued to Bridgeport. A policeman looked twice at the automobile and saw that the chauffeur's license was not attached, although a dealer's license tag was displayed, and as a result the chauffeur was taken to court.

It was in vain that his attorney pleaded with Judge Lockwood that the car was in the sheriff's custody and that he had the right to take it or send it to the storehouse without adding to or taking anything from it, even a license tag. Neither did it do any good to tell the court what awful things might happen if every sheriff who attached a saloon had to take out his own license from the county commissioner before he could run the business, while in his custody.

"The statutes are quite clear," said Judge Lockwood. "Ten dollars fine." Young paid out of his own pocket and is now wondering who is going to reimburse him.

Putting "Satanic" Speed to the Test.

Although no less than four eye-witnesses recently stood up before one of the lower German courts and swore that a certain motorist had raced through their village at a "devilish rate of speed, without sounding a horn or anything," the court declined to believe them and decided upon a personal investigation of the village and its roads. An automobile was used—in fact, the very car which was supposed to have traveled at the "satanic" rate—and his Honor, the judge, took a seat from which he could keep the speedometer in view.

While going at 20 kilometers an hour the car was stopped by a constable, who

claimed it had raced at 45 kilometers; a passing peasant vociferously proclaimed that it was going like the storm; in a minute several other peasants assembled, each asserting he had watched the car draw near, and swearing to a speed "like an express train," and so forth. The judge said nothing, but produced his credentials and the villagers melted away.

Leaving the village, a team was encountered which, despite continuous and loud signaling, refused to make room for the automobile to pass; when finally it did swerve to one side, it did so to the wrong side of the road. And still the judge said nothing. But back on the bench, he discharged the motorist; had the constable reprimanded and fined, and finally lodged a charge of perjury against the willing villagers, who were too ready to swear to speeds which were quite unattainable by that particular car.

Where Long Days Promote Motoring.

Why the Northwest seems to take more pleasure in motoring than the South, and, incidentally, why there are more automobiles sold per capita in the former part of the United States, is explained very plausibly by a motorist from Minnesota, who was a recent visitor in New York. "Persons living in the Northwest and the North," he says, "take more pleasure in automobiling than do those who live in the South, because of the length of the days. Much of the pleasure can be and is secured late in the afternoon and evening. The night time does not really begin until nine-thirty or ten o'clock. A newspaper can be read easily at nine o'clock during the summer months. This makes night driving a great pleasure and does much to make an evening enjoyable rather than tiresome, as is the case where constant vigilance must be kept owing to the intensity of the darkness."

Headlights Cause a Peculiar Accident.

The glaring headlights of an automobile driven along Pelham Parkway, New York, the scene of so many accidents, were responsible for the death, respectively fatal injury, of two persons, on Wednesday last week. Charles Hirsch, a manufacturer, of Brooklyn, and John Wotka, a chauffeur, were the victims of the peculiar three-cornered accident. It seems that Hirsch, who was driving his own car, had become stalled and had crawled under the machine to make repairs, when a second car approached from behind, driven by John Wotka. Nearing the scene of the accident, the chauffeur was blinded by the rays of the headlights on a third car, coming in the opposite direction, and ran full speed into the stalled car, crushing Hirsch to death and suffering fatal injuries himself. The third car, whose headlights were responsible for the crash, also ran into the wreck, but its passengers escaped with a general shaking up.

THE MINOR AND HIS POCKET MONEY

Germany's Highest Court Rules He Cannot Use It to Buy Motor Cars—Lottery Ticket Complicates Tangle.

With the increasing number of automobiles in Germany, the legal tangles caused by its use naturally are multiplying. One of the most peculiar cases, in which the automobile upset a law of long standing—namely the right of a minor to spend his pocket money as he pleases—last month came to a close before the Reichsgericht. That the case could reach this court is proof enough of the extreme importance attributed to it by the parties to it. The points involved were out of the ordinary.

A seventeen year old boy received from his father every week three marks—equal to about 75 cents—as pocket money, to do with as he pleased. The boy invested one week's allowance in a lottery ticket and was lucky enough to win a prize of 4,000 marks. As soon as he had the money in his hand he repaired to the nearest automobile dealer and purchased a car for 3,200 marks, paying cash. The dealer was somewhat suspicious about the lad's right to handle the sum, but when shown the lottery slip, the prize winners' names and the letter from the lottery concern advising him of his luck, his suspicions were allayed.

The boy's father, however, had other opinions about the use of the money, and returning the car to the dealer, he demanded that the purchase price be refunded. The dealer refused and a long drawn out legal battle ensued, which ended in the dealer being compelled to return the money. The Reichsgericht, in upholding the lower courts, found that while it was true that the father had given his son three marks a week to do with as he pleased, he never imagined the possibility of the latter buying a motor car with it, and that he probably would not have consented to the purchase had he known of it.

"Although the German law distinctly states that purchases made by a minor with money given to him by his father or guardian are legal," the court added, "the present instance must be considered an exception; no minor should be permitted to purchase an automobile unless with the specific permission of his parents—regardless of the source of the money."

How Paris Checks the Scorchers.

Following a wave of overspeeding in Paris, the Prefect of Police has determined to invoke a clause of the law of 1901 which gives him the power to withdraw driving licenses in all cases of second consecutive permission of his parents or guardians—regardless of the source of the money."

REFINEMENT OF THE COLE LINE

Lengthened Wheel Base, New Axle and New Oiling System the Most Notable Changes—Demountable Rims Adopted.

As a means of distinguishing between the present line and that which immediately is to succeed it, the newer models will be designated, not as Cole 30, but as Cole

increase its usefulness, however, while the complete line will be extended to embrace seven distinct models, one chassis sufficing for them all, the four open models listing uniformly at \$1,800. As is befitting the extra coachwork, finish and equipment, the three enclosed models will be sold at advanced prices.

A summary of the changes which have been brought about indicates that the unit power plant with its four-cylinder 4½-inch

ment. Tire sizes likewise have been increased from 34x4 to 36x4 inches, and Firestone demountable rims are now to be used as standard equipment. The double-drop frame is retained, but has been lengthened to correspond with the added length of base.

An improved engine oiling system has been adopted, which is a combination of the constant level splash and force-feed systems. Oil is fed into the crank case

30-40 models. The change also expresses in a measure the conservatism of the former rating. The Henderson Motor Sales Co., of Indianapolis, Ind., which markets the Cole output, in making its announcement also lets it be known that the product in most respects will continue unchanged. A number of minor alterations will serve to

"square" motor, three-speed change gear and shaft drive has proved entirely satisfactory in the hands of the users. It has been deemed expedient to increase the wheel base from 118 to 122 inches, however, while a new Timken full-floating rear axle with triangular torsion member has been substituted for the former axle equip-

continuously by means of a plunger pump, but in very small quantities; the feeding point being the center of the middle cam shaft bearing. By this means the cam shaft is amply lubricated, while a constant renewal of the supply in the base is ensured. As the pump is geared to make but one stroke for every 50 revolutions of the crank

HERE'S THE FLANDERS ELECTRIC

**Long-Expected Car Is Formally Launched
—Proves to Be an Attractive Creation at an Attractive Price.**

Distinterested students of the automobile industry long have entertained the conviction that a fine opportunity awaits the manufacturer possessed of sufficient confidence in the electric vehicle to place on the market a new design contrived in such a way that it could be produced and sold in great quantities at what, judging by ruling figures, would be considered a very low price. That a period of lower priced elec-

shaft, it follows that the influx per revolution is very small, while the slow speed of the pump prevents it from gagging even when the engine is turning over at very high speeds. The circulating system depends on the splash resulting from the dipping of the connecting rod ends in individual basins that are provided in the case for the purpose. An original feature of the system is that the oil instead of draining back directly into the case is caught in suitable channels, which carry it forward progressively from the basin under one cylinder to that below the next in front of it. The oil thus travels constantly forward and is returned to the rear part of the case from the front crank pit by a special channel arranged for the purpose. This method of gravity distribution prevents any stagnation or pocketing of oil and also prevents unequal feeding to the different cylinders, even when the car is running or standing on grades.

In the way of finish the appearance of the new models has been considerably improved by the adoption of nickel plating as a standard method of treatment, all parts that are not finished bright being enameled black. Large ornamental side lamps are used, a noteworthy point about the equipment being that while electric lights are not standard equipment all lamps are of the combination variety, so that the installation of the double lighting system can be accomplished without embarrassment or undue expense. The control levers are mounted on the driver's right, and in the five-passenger touring car are placed inside the front door. On the small tonneau and roadster models they are placed outside as contributing to the general appearance of the machine by permitting a symmetrical arrangement of the body.

The entire line as at present constituted consists of the five-passenger touring car, small tonneau, roadster and speedster—the latter being a light and racy machine of the high-speed roadster class—these comprising the standard models. The enclosed types are the inside-driven coupe, which is a clean-cut version of the sedan type of body, the limousine and a so-called London limousine, which is an inside-driven, five-passenger car of the sort that should appeal particularly to the owner-driver class, particularly for fall and winter driving in town and country.

Stearns Slide Valve Models in Demand.

That the F. B. Stearns Co. has had no cause to regret its radical action in discarding the poppet valve motor for the Knight slide valve engine and is not likely to experience such regret, was remarked by H. H. Hower, the Stearns advertising manager, who was in New York yesterday. Last week, he reports, which was the third week since the new Stearns models were announced, the orders received were 20 per cent. greater than during any previous week in the company's history.

sign reveals modern ideas applied with consistency and thoroughness.

As the picture shows, the body is of generous proportions, designed along new lines, but with ample suggestion of the antique coach form which is so much in favor with closed car builders at the present time. The wheel base is 100 inches, and the entrance has a step ten inches from the ground. Owing to the liberal interior proportions accommodation is afforded for five passengers, or even six on occasion, while the gray whipcord, blue broadcloth and leather upholstery—either style being optional to the purchaser—are of standard and approved design and manufacture. The equipment includes specially designed side and tail lamps, as well as two sets of slip covers, the

NEW FLANDERS ELECTRIC WHICH SELLS FOR \$1,775.

trics is destined to come is far from improbable, and it is likely that the advent of the Flanders electric, which just has been announced, will go a long way toward strengthening the expectation. The new product is built up by the Flanders Manufacturing Co., of Pontiac, Mich., in which Walter E. Flanders is the moving spirit.

While the introduction of the new electric long has been foreshadowed and many of its features already had become familiar to those "in the know" there is every reason to believe that it will in no sense prove a disappointment. It is designed along exceptionally graceful lines, has the low entrance and low center of gravity, which make for easy riding and convenience in city use, and, furthermore, is placed at a figure that is likely to cause it to attract attention, its price being \$1,775, fully equipped. It is further distinguished by reason of the fact that it is worm driven, that form of transmission lending itself especially well to the smooth and silent-running qualities of the electric motor as well as to the high gear reduction which the speed of the motor commands. In other respects as well the mechanical de-

latter being included out of special deference to the delicate habiliment of possible lady occupants.

New Steering Gear for Truck Use.

After four years of study and experimentation the Schweppe & Wilt Mfg. Co., of Detroit, Mich., which makes a specialty of producing steering gears and connections of various sizes and types, has evolved a new style steering gear for trucks, in which are combined the advantages of great strength and durability, long leverage and semi-reversibility. The particular advantages of the latter quality, as pointed out by the makers in a circular which just has been published, are that it protects the gears from excessive shocks, such as are sustained by the irreversible gears, while it offers sufficient resistance to render the gear easy to handle. The mechanism is an adaptation of the familiar principle of the back-gearing of a lathe, and is solidly mounted in a two-part case which is parted along the horizontal plane. The gear is made in two sizes, one for one-ton trucks and the other for vehicles of three to five tons capacity.

"Silent" Chains as Substitutes for Sliding Gears

The question of the reduction of the multitudinous noises which at present are more or less synonymous with the operation of self-propelled vehicles, is one which interests both owner and manufacturer. Other things being equal, and given the choice between two cars, one of which was slightly noisier than the other, which of them would the average individual choose? The answer is obvious. And of all noises, none compares to that produced by the ordinary type of change gear sets in which the usual type of spur gears is used.

Naturally, the next question which arises is: "Why are spur gears noisy?" Theoretically, they should not be so. That they are, however, is a matter which requires small proof; and it practically is impossible under existing conditions to so finish gear teeth as to make them operate noiselessly in the proper sense of the word. Some are quieter than others, it is true, and while this is due in a large measure to methods of manufacture, it is the opinion of at least one authority that the production of such silent gears is purely accidental. Which apparently is borne out by the fact that of several sets of gears made of the same stock, with the same machinery and under identical conditions, one set will be quieter than the others.

The difficulty of producing practically silent gears becomes apparent from the statements of several engineers, who agree that for noiselessness, as it generally is understood, it would be necessary to grind gear teeth accurate to within 0.01 millimeter, which is 0.000394 of an inch. Whether or not such a degree of accuracy could be obtained, even by extremely careful cutting and grinding and subsequent "running in" with oil and emery or some other abrasive agent, is open to question.

But if such a degree of accuracy were possible, and the gears thereby might be made practically "noiseless," it readily may be appreciated that the cost of production would be well-nigh prohibitive, at least in the case of commercial vehicles where first cost of the vehicle constitutes such an important feature. Spiral or herring-bone gears might be used and, in fact, have been and still are used to a limited extent. But they require even more accurate manufacture than the spur type, the opinion of a noted British engineer being "that they must be as accurate as a ball bearing, or even more accurate." "They must be ground perfectly," he says, "and as far as I am aware there is no method for grinding small spiral gears which is anything like practical, on account of the cost."

But while the manufacture of pleasure

vehicles warrants such expensive methods, and logically, on the score of increased efficiency, the manufacture of commercial vehicles warrants it, too, it is a psychological fact that the purchaser who demands and is willing to pay for silence in a pleasure car, cares little for such a feature in a commercial vehicle. Perhaps the situation is well explained by the answer of an owner of a by no means small fleet of motor trucks, who said, when questioned on the desirability of silence: "What do I care how much noise my trucks make? I don't have to ride in them, and as long as they deliver the goods that's all I'm worrying about." Briefly, there is little or no demand for silence in motor trucks, therefore they are the most flagrant offenders.

COVENTRY NOISELESS GEARSET

That there ought to be an insistent demand for silence, if not for the absence of noise itself, then for the increased efficiency, is apparent. A noisy gear box spells friction, and as friction means wear and the absorption of power, the genuine desirability of noiselessness becomes apparent.

But whether or no owners or prospective purchasers desire silence, there is another side to the question. They may be forced to demand it. Already a large number of cities and towns have passed laws making the use of muffler cut-outs and loud horns punishable by fine or imprisonment and it is not unlikely that similar laws, affecting those who permit other kinds of unnecessary noises, will be enacted. Laws or no laws, however, it is an undisputed fact that the public must be catered to to a certain extent, and the application in this case consists in the elimination of noise.

Just how much influence public opinion may have is well evidenced by the experience of the great London General Omnibus Co., of England. The company operates a very large fleet of public service motor buses and they are quiet. But they

were not quiet up to a short time ago. The noise emanated from the gear boxes and it was so annoying and the complaints were so numerous that the authorities of Scotland Yard, from whom licenses must be obtained, refused to permit their operation, the result being that the owners were forced to take steps to abate the nuisance. This they did by replacing the gear driven change gear sets with chain driven "gear" boxes. The buses thereby have been made noiseless, their efficiency has been increased, less repairs are necessary, and those that require to be made are done with greater facility. In fact, the manifold advantages of the chain "gears" are so apparent that the London General Omnibus Co., which owns the patent under which the boxes are made, now has some 300 in use and is replacing the old type of gear driven transmission as rapidly as is possible.

Up to the present time, the chain driven "gear" has not made its appearance on American cars, though, in view of the fact that at least one prominent firm of American manufacturers has been investigating its possibilities with a view to adopting it for commercial vehicle work, it is not improbable that it will be seen here in the not far distant future.

The general shape of the chain driven gear set is not unlike the familiar types of gear driven boxes, the accompanying illustration, which shows a box manufactured by the Coventry Chain Co., Ltd., Coventry, England, being designed to transmit 20 horsepower at 1,000 revolutions a minute. In size, however, and in weight, it is larger and heavier, and for this reason it is doubtful whether it would be available, economically, for use in pleasure vehicles. For the work for which it is intended primarily, however, the transmission of power in commercial vehicles, it undoubtedly possesses many advantages not found in any other type of change gear set, and it is claimed that its slightly increased first cost will be more than offset by the increased service and efficiency and freedom from trouble.

The chains which are used are the Coventry "Noiseless" chains and they differ materially from the usual type of roller or block chain commonly used for power transmission. As ordinary chains "stretch" and the sprocket teeth become "hooked" owing to the sliding action of the chains, which therefore soon fail to fit the sprockets properly, they become noisy and inefficient and are unsuitable for long continued use without attention. In addition to which, when the chain becomes worn and

does not fit the sprockets properly, but one of the links, and consequently one of the sprocket teeth does any work. The so-called "silent" chain, however, of which the Coventry chain is an example, is heir to none of these ills, which is to say, that there is no appreciable sliding action between the chain links and the chain wheels, and therefore there is only very slight wear.

Such wear as occurs comes at the hardened steel bushings through which the pins which join the links are placed. The links are steel stampings so formed and assembled as to present two V-shaped teeth toward the corresponding chain wheel teeth. The adjacent teeth are pointed together flexibly, the plates of one link being interposed between those of the next link, on the pivot pin. In action, the tooth driving faces of the chain drop into direct contact with the teeth on the chain wheel and leave without slippage at the points of contact. There is no sliding action, the links lifting themselves clear of the chain wheel teeth. As the chain lengthens, owing to wear in the pivot pins or at the faces of the teeth, it automatically climbs the chain wheels, assuming a larger pitch circle, all the links thereby still coming in contact with the chain wheel teeth and therefore doing their proper share of the work.

There are three general methods of maintaining the chains in position on the chain wheels. The first of these, and the one which is most generally used, is to form the chain wheels with circumferential grooves in their centers and use a set of blank links which fit into the grooves. Another method embraces the use of blank links at each side of the chain enclosing the chain wheel. The older method of employing flanged chain wheels, though still used in isolated cases, gradually is giving away to the two former methods.

While the chain transmission for change gears has but recently attained to any considerable degree of prominence, it is by no means new, and the old saying that "there is nothing new under the sun" holds good in this case as it does in an infinite number of others. Which is to say, that back in 1904, when the automobile industry was scarcely out of its swaddling clothes, a prominent pioneer American manufacturer, Elwood Haynes, conceived of the possibilities of this type of transmission and employed it on a number of the Haynes cars of that period. Morse chains were used and the speed changes were obtained by means of individual friction clutches. Many reasons for the disappearance of the transmissions from Haynes cars have been ascribed, but it is likely that the principal one was the failure of the friction clutches to measure up to the exactions of an uneducated public.

At any rate, the chain transmissions were replaced with the orthodox types of gear driven change gear sets, and not until about a year ago, when the London Gen-

eral Omnibus Co. first started to use chain "gears," did they again make their appearance in such form as to merit serious consideration. At present there are two types of chain driven change gear sets on the market, the Aries, which is manufactured by the Aries company, of France, which company has but recently taken up chain transmissions for use in pleasure cars, and the Coventry, which is illustrated herewith and which is used by the London General Omnibus Co.

As may be seen in the accompanying illustration of the Coventry chain transmission, the chains are not all of the same pitch, which is to say, that the distance between link centers of the two outer chains is greater ($\frac{3}{4}$ of an inch) than the distance between link centers of the center chain ($\frac{5}{8}$ of an inch). In the Aries transmission, on the other hand, all the chains are of the same pitch. The reason for the difference of pitch in the Coventry chains probably is merely for convenience in design and to obtain the proper ratios while maintaining all the chains with the proper degree of slack.

In both of the designs three speeds ahead and reverse are provided for, and in both of them the reverse motion is obtained by means of spur gears, it being impossible in the space allowed to use chains for this purpose. The Aries transmission also differs from the other in that there are no intermediate bearings on either the main or lay shafts. The Coventry has a center bearing on both shafts. Despite these slight differences, however, both types are very similar and in operation are identical, the lay shaft in each case being constantly in motion as long as the motor is running and the clutch engaged.

In each case the changes of gear ratio are obtained by means of sliding jaw clutches, third speed ahead being the direct drive. It has been suggested that for those cars in which the highest gear ratio obtainable is an over step, i. e., the road wheels are rotated a greater number of turns per engine turn than when the direct drive is used, the chain transmission should prove ideal owing to its silence. Several American cars now are built with over step transmissions, and while they are undoubtedly quiet in a sense, the degree of noiselessness which is obtained is not as great as might be realized with chain transmission.

Briefly, the advantages of the chain transmission are efficiency (94 to 96 per cent.), absolute quietness when running, freedom from noise when changing "gears," and long life. To these must be added the facility with which repairs, when necessary, may be made. In this respect, the remarks of A. R. Clayden, a prominent British engineer, and editor of the Automobile engineer, made at the recent convention of the Society of Automobile Engineers at Dayton, Ohio, shed an unwonted light.

"There is one advantage of the chain box

for truck work," he said. "We find in England that omnibus drivers and truck drivers are very careless men. They are likely to knock the transmission about, but the worst thing you can do to a chain transmission is to break a chain. The cost of renewing the chain entirely—not considering the cost of a few links—is very small; and it is absolutely nothing as compared with the cost of putting in a new spiral gear which has been stripped. To insert a new spiral gear means taking the whole box to pieces. I know the London General Omnibus Co. claims that they saved \$6,000 a year on work alone, and on nothing else." From which it would appear that the chain transmission actually is a factor of safety and thus protects other and more expensive parts of the vehicle from injury.

There is another cause of noise in the ordinary type of gear driven change gear set to which very little attention is paid, namely, the improper meshing of the gears through wear in the bearings of the shafts. Naturally such trouble is foreign to the chain transmission, as the amount of wear which is inevitable with either type and which would have a decided effect on the noise producing proclivities of the gear driven box, would, owing to the construction of the chains, which allows for a certain amount of wear, have absolutely no effect, as far as to cause noisiness, on the chain transmission.

Last but not least, there is a decided advantage in the chain transmission in case of breakage of one of the chains. In the case of a stripped gear, for instance, it would be a hazardous proceeding to run the car at all until the broken parts had been removed, as there would be danger of the shattered teeth being carried by the lubricant into the other gears and causing further injury. With the chain transmission, on the other hand, the breakage of a chain need cause no further apprehension on the part of the driver. Only one speed would be "put out of commission," and the broken chain would simply drop down into the oil sump out of the way. That is, it would if the oil sump were large enough to accommodate a broken chain. It is in the Coventry and Aries transmissions, and this is a point which should be remembered by manufacturers.

Plainly, it seems only a matter of time before manufacturers will turn to the chain transmission. Sliding gears long have stood the abuse of the initiated and the uninitiated alike. They have been styled "unmechanical," and it is certain that they are not as efficient as might be expected, though in this respect it is only fair to say that in their present forms they are more efficient than they ever were before, which may or may not mean that they are susceptible to little if any further improvement. At any rate, numerous attempts have been made to do away with the change speed mechanism entirely, whether merely for the simplification of the vehicle or for increased effi-

TWO NEW MODELS FROM WARREN

More Powerful Than Old But Bear Family Characteristics—Price of "30" Reduced and Value Increased.

Recognizing a distinction between the demands of hot weather comfort and cold weather comfort, the new model Warren-Detroit cars are to be made with detachable front doors, the attachment being made in such a way that this feature is not revealed to the eye at any time. In its announcement the Warren Motor Car Co. indicates that it will produce three distinct models, of 30, 35 and 40 horsepower, respectively. The 30 is to be a continuance of the single chassis which has been produced up to this time and will perpetuate many of its successful features. The other two models will be slightly different in point of detailed construction, but will retain the same general construction that al-

WARREN 35 CLOSED-FRONT ROADSTER COMPLETELY EQUIPPED. PRICE \$1,415

floating rear axle which is coupled to the chassis by means of a torque rod of conventional pattern, the propeller shaft

of the 30 remain about the same as hitherto, but in connection with its revision it has been found possible to reduce its cost to the consumer slightly. The five-passenger touring car now sells for \$1,250, instead of \$1,350, as formerly, the price including top, windshield, Bosch magneto, 34 x 3½ inch tires, Universal quick detachable rims, three oil and two gas lamps, gas tank, horn and tools. The top and windshield, detachable rims and certain other items, such as the tonneau rails, are added to the previous specifications, so that in point of value to the purchaser, the net price for the complete car has been lowered more than the mere price quotation would make it appear. Similarly the small tonneau now lists at \$1,250, instead of \$1,300, while the roadster is priced at \$1,125 instead of \$1,200. The greatest price reduction, however, is that of the torpedo, which now sells for \$1,300, with practically the same equipment as the touring car, whereas the former price was \$1,500. This model has a 4 x 4½ inch motor, 110-inch wheel base, double ignition, semi-elliptic front and three-quar-

NEW WARREN 40 CLOSED-FRONT TOURING CAR. PRICE \$1,700

ready has become identified with this particular one of Detroit's many automobile products.

In comparing the construction of the three types that now are being marketed it is necessary to distinguish chiefly between motors, change gears and rear axles. The power plant equipment of the 30 and 35 horsepower models comprises a block type of motor with valves on the right, a three-speed sliding change gear and semi-floating rear axle with torsion tube enclosing the propeller shaft. The new 40 horsepower model, on the other hand, while retaining the block type of motor, practically the same in general construction as that used in the other two models, has its power plant mounted in the reverse position, the valves thus being placed on the left, together with the carburetter and intake and exhaust piping, the pump and magneto being on the right. This model also has the so-called vertical type of change gear, in which the lay shaft is carried under the driving shaft, and a full-

thus being equipped with two universal joints.

As has been intimated the specifications

WARREN 30 TORPEDO SELLING AS EQUIPPED FOR \$1,300

ter elliptic rear suspension and external-internal brakes.

The "12-35" model, as it is called—the numerical prefix to this and the other model designations indicating merely that they are designed for the market of this year and next—is built as a five-passenger touring car and closed-front roadster, and sells for \$1,500 in touring and \$1,415 in roadster forms. It is somewhat larger than the 30-horsepower model, though resembling it in a number of details, and carries what is now known as full equipment in both styles. It has a $4\frac{1}{8} \times 4\frac{1}{2}$ inch motor, the valve stems and tappets of which are enclosed by readily removable cover plates which serve to reduce the sound of the enclosed parts, cone clutch, connected with the change speed gear by means of a sliding universal joint, 112-inch wheel base, and is made with 56-inch standard tread, and 60 inch for the southern trade.

The new 40-horsepower car is a much more impressive machine, despite the fact of its close similarity in line and feature with the two less powerful models. To render it easy of access and afford it a low center of gravity it has a double-drop frame, instead of one that is raised in the rear only, this circumstance, together with the employment of tool boxes mounted on the under side of the running boards, serving to accentuate the rangy appearance which its 116-inch wheel base lends to it. The 40 motor is of $4\frac{1}{4} \times 4\frac{3}{4}$ inch bore and stroke, otherwise being of uniform design with the 35-horsepower style. It is built in the form of a liberally proportioned touring car to sell for \$1,700, with complete equipment, including demountable rims.

As is true of the other two models, it has double ignition, including the Bosch high tension magneto, and two sets of spark plugs with independent wiring. The new style change gear mechanism which is used, is mounted in a one-piece casing, which is hung by four arms from the sub frame, which also carries the motor. The springs, which are of the same general style as those used on the smaller chassis, are $\frac{1}{4}$ inch wider, being $2\frac{1}{2}$ inches in width, and the 38-inch front spring is 2 inches longer than that of the 35-horsepower model. The rear spring is 48 inches long, which is the same size as is used on the smaller cars. In the matter of finish and fitting, extra pains have been taken to render the machine completely satisfactory, the closed-front body being equipped with ventilators, the tonneau being arranged with robe and foot rails, and the lamps enamel finished.

Remy Once More Enlarges Its Plant.

By the addition of a building, 60 x 90 feet, which just has been completed, the Remy Electric Co. has increased the size of its plant in Anderson, Ind., to approximately 150,000 square feet. The new structure is of brick and is designed to afford the maximum of daylight.

REGAL FEATURES ITS NEW COUPE

Underslung Closed Car of "Nifty" Design Disclosed—Higher Powered Touring Car Also Due to Appear.

To the rapidly growing list of inside driven coupes the Regal Motor Car Co., Detroit, Mich., has added a new and distinguished looking offering in its new Regal 20 Colonial model, which is an adaptation of the underslung mounting to the enclosed type of car. The effect is to secure a most striking vehicle in which the curved roof and paneled windows of the Sedan body are rendered conspicuously attractive by

is sufficient to afford a good market for such a machine.

In addition to the new coupe and the underslung roadster, which has sundry minor improvements as compared with the current output, the new Regal line will comprise a brand-new 35-horsepower underslung roadster and a standard type chassis, which, as a five-passenger closed-front touring car, will sell for \$1,000, and as a small tonneau for \$1,050. The new underslung model, the price of which will be \$1,400, will have 118-inch wheel base, 34 x 4 inch tires and standard equipment, including gas searchlights. In point of structural make up it will have a $4\frac{1}{4} \times 4\frac{1}{2}$ inch four-cylinder motor with dual ignition, a three-speed gearset mounted on

REGAL 20 HORSEPOWER UNDERSLUNG COLONIAL COUPE

the low elevation of the top, the large wheels and the long and sloping guards. The model is further rendered attractive by its extremely low price, which has been fixed at \$1,250.

The chassis is the same as that of the model N underslung roadster, which was brought out last winter. It is equipped with a $3\frac{3}{4} \times 4\frac{1}{2}$ -inch four-cylinder motor with dual ignition, cone clutch, three-speed selective change speed gear and shaft drive. It has a 100-inch wheel base and 34 x 4 inch tires.

The coupe body is designed with liberal proportions, full advantage being taken of the available space on the chassis. Consequently it is roomy and comfortable, accomodating three passengers without cramping and affording entrance and exit from either side. The underslung suspension, giving a low center of gravity and a low entrance, is particularly suitable for city and suburban use, and the car has been put on the market with particular reference to the requirement of physicians and professional men for an enclosed car of the inside driven type, and which, it is believed,

Hyatt roller bearings, shaft drive and cone clutch.

Horn's Tone Controlled by Push-Button.

Eliminating the complications of batteries, switch and wiring, the G. Piel Co., New York City, has brought out a new horn of the siren tone type which is wholly mechanical in operation. Compactly constructed and carrying a six-inch projector, it weighs but five pounds and is readily attachable to any convenient part of the car. The sound-producing elements are a diaphragm and a rotor carrying a series of rollers which contact against a pin projecting from the diaphragm. The rotor is driven from the push-button by which the horn is operated through a rack, gear and ratchet mechanism. The strength and pitch of the sound depends on the vigor and rapidity with which the button is depressed, the tone thus being entirely within the control of the operator. All contact parts are hardened and the general construction is such as to ensure long life and continuous operation to the mechanism.

SWISS METHOD OF METAL COATING

**Schoop's New Process and the Promise
That It Holds—Preserves Wood and
Prevents Iron and Steel Rust.**

By the invention of a new method of metal coating it is thought that several manufacturing problems which heretofore have proved difficult of satisfactory solution now may be disposed of in an economical manner. The process is of particular interest to the automobile industry for the reason that it permits most of the common metals to be deposited on various surfaces in a manner that is especially useful for protective purposes. The metaliz-

ing of wood body surfaces is one of the possible applications that immediately presents itself, as does the aluminizing of various iron and steel chassis parts to prevent them from rusting.

such a gas may be used at this stage as will oxidize the metal, so as to give a coating of oxide instead of metal. The action of depositing the metal appears to be as follows:

"When the metal is atomized in the form of a cloud, its particles strike the surface which is to be covered, but here they lose their original spherical form and are flattened out upon the surface into blotches which unite together and form a continuous layer of a certain thickness over the object. The metal is projected at a very great speed from the orifice, and this explains why the particles are no longer liquid when they reach the surface of the object, are able to make up a homogeneous and very compact layer whose density is about the same as for the metal in its usual state,

to coat the ironwork all over with a non-rusting metal layer more durable than any kind of paint, and, as the inventor claims, also more economical. Numerous applications which suggest themselves for the new process might be divided into two classes. On the one hand we may wish to coat an article for decorative or protective purposes; on the other hand the aim may be to form a crust over an article, in order to subsequently strip it off in form of a mold. Additional uses of a somewhat different character are the coating of wood, porcelain or glass, to render their surfaces conductors of electricity; and the metal coating of glass mirrors, whether parabolic, spherical, plane, or of any other kind.

"Among the uses which may be made of the process for the purpose of applying a protective coating, may be mentioned the encasing of telegraph poles at the end which is buried in the earth, and especially at the point where they emerge from the ground. By metal-coating wooden propellers for airships and aeroplanes the double purpose may be served of imparting to them a protective coating and reducing their friction. A peculiar application is the deposition of an aluminum layer one-eight-hundredth of an inch thick upon balloon envelopes, whereby they are rendered gas and water tight. Capsules for bottles can be very economically replaced by metal coating put on by the new method. A bottle thus sealed is hermetically closed, and cannot be used again without showing obvious signs of having been opened before. A good substitute for tinfoil, such as used for wrapping chocolate and the like, can be made by metallizing paper, the surface of which is burnished or in any other way given a bright or satinized surface.

"The somewhat perplexing problem of coating metal or other substances with aluminum seems to be most satisfactorily solved by Mr. Schoop's new method. This application alone would render the new process very valuable. Other uses which have been suggested are the metalizing of textile fabrics, of the inner surfaces of new pneumatic tires, the coating of bottles and other vessels for use in chemical industries, the metalizing of carpets for theater decorations almost any number of others which will readily occur to the reader.

"Examples of the second class of application mentioned above, in which the process is used to produce a surface mold, are the manufacture of printing blocks, stereotype and matrices, and the production of a variety of articles ordinarily prepared by the galvano-plastic process. There is no difficulty in making hollow objects, such as, for instance, seamless metal tubes. The possible applications of the new process seem, in fact, almost unlimited, while the inventor claims that in point of view of economy his process easily wins over most of the methods at present in use."

APPARATUS USED IN THE SCHOOP METAL COATING PROCESS

as experiments made at the Zurich laboratory have shown. Even though the metal has been melted in the crucible, the vapor is not very hot when it is projected out by this process, so that there is no difficulty in depositing it upon readily combustible substances, such as paper, wood, celluloid, or even animal tissues.

"The deposits of metal thus prepared are much harder than those obtained by the usual methods. For instance, tin, when cast, showed only a little over one-half the hardness of tin applied by the Schoop process, when tested by the Brinell method of dropping a steel ball and observing the mark made by it. Under the microscope there appeared to be no difference as to the fineness of the structure as compared with the ordinary metal.

"The new process lends itself to a number of interesting and useful applications, since most of the common metals can be deposited in layers upon various surfaces. One very important use should be the coating of structural iron to protect it against weathering. The operation should be readily applicable to finished structures, such as cranes, bridges, etc. There should be no difficulty in making the coating apparatus portable, so that it can be used on the spot

ing of wood body surfaces is one of the possible applications that immediately presents itself, as does the aluminizing of various iron and steel chassis parts to prevent them from rusting.

The process is the invention of M. Schoop, a Swiss engineer, who first demonstrated it before the Engineers' and Architects' Association of Zurich. It has since been presented before the French Academy of Sciences by Prof. D'Arsonval. According to the Scientific American, the metal coating is produced by spraying a cloud of finely atomized metal particles on the surface to be covered. That authority goes on to describe the process in detail as follows:

"The metal is melted in a crucible and is allowed to escape by a capillary opening, under a pressure placed upon the surface of the melted metal by compressed air or other gas. Just after emerging from the opening, the thread of melted metal escaping under pressure is atomized by a gas or steam spray, so as to form a cloud of finely-divided metallic particles. Through this cloud is passed very rapidly the object which is to take the coating. An inert gas is best used to give the pressure on the melted metal, while another kind of gas can be used for the atomizing. If desired,

WEED CHAIN GRIP PATENT UPHELD

(Continued from page 386)

kind, and, therefore, could not have pre-conceived the Parsons concept. At most their devices are mere rough embryos, in an altogether different connection, of some features of what subsequently became the mechanical embodiment of the Parsons concept.

Patent No. 681,173, issued October 20, 1901, to Maxim & Bardwell, for a detachable traction strap, is the only alleged anticipating device upon which we have had any trouble. One question of fact arises in connection with this patent, viz., were the transverse straps, or some of them, intended to pass around the felly of the wheel, or was it left optional to thus fasten them or not? The Parsons patent having been granted by the Patent Office, the burden is on the defendant to show anticipation. This burden the defendant has not clearly met. Were the case to turn on this question of fact, we would be inclined to hold that the Maxim & Bardwell patent contemplated that the device was to be thus fastened upon the wheel by such straps, more or less in number. It is not necessary, however, that we should thus hold.

As already stated, the Parsons concept was an entirely novel one in connection with automobile anti-skidding devices. It contemplated, in operation, two features: (a) that as a method of gripping the ground and thereby obtaining traction the transverse chains next the ground should loosely lie on the ground; and (b) that as a protection to the tire the transverse chains should move circumferentially around the tire—not that slow circumferential movement that is an incident even to the close fitting devices, but an easy circumferential movement—a movement that, instead of being a mere incident, is one of the functions of the adjustment. In the Parsons concept the transverse chains, instead of

being practically an integral part of the wheel taking hold of the ground, are a part of the ground upon which the rubber of the wheel takes hold, and the circumferential movement, instead of being a forced movement resulting from the hammering of the transverse chains upon the ground, is a movement that results from the mere looseness of the adjustment; and these two distinct purposes of the concept find their mechanical embodiment in the utilization of the two rings smaller in diameter than the periphery of the wheel inclusive of the tire, so that they cannot come off, but long enough that the transverse chains, as they approach the ground in the revolution of the wheel, fall loose from the tire by gravity, these falling loose upon the ground in advance of the wheel, and thus, also, causing them to advance circumferentially on the wheel.

The Maxim & Bardwell patent, on the other hand, was meant to be tight fitting—in effect an integral portion of the wheel—either because of the character of the material used or of the auxiliary means of attachment; for anything else than a tight fitting sheath would not only destroy, in that device, the transverse straps, by rolling them up as the wheel proceeded, but would destroy the tires also, by turning in upon them the pins that the patent contemplated the straps should contain. In other words, Maxim & Bardwell had neither the concept of transverse straps being laid upon the ground upon which the rubber should take hold (the Parsons concept) nor the concept of circumferential motion as a function of the device and due to the looseness of the adjustment (the Parsons concept) nor the mechanical arrangement or embodiment that in operation would bring about that result.

True, this difference, so far as it is a difference in mechanical arrangement and embodiment, is a difference largely of what we call the looseness or tightness of fitting of the rings upon the wheel. But this does

not make it, in our judgment, a difference in degree only. It is just this looseness of fitting that makes the Parsons concept, in both of its purposes, practicable; and if the Maxim & Bardwell patent be practicable at all, it is just this absence of looseness of fitting that makes it so. In mechanical embodiment, therefore, as well as in concept, there is a tangible something that, present in the one and absent in the other, separates the one from the other—causes the one to operate differently from the other. True, that something is what may be called "Arrangement" or "Adjustment." But where "Arrangement" or "Adjustment" makes operative and practicable what was before inoperative and impracticable, and is not itself so obvious that its utilization is not of higher merit than the mechanic's skill, "Arrangement" or "Adjustment" may be the basis of invention. In our judgment the arrangement or adjustment of the Parsons concept would never have been thought of in connection with this use, outside the Parsons concept, and it is our judgment that the Parsons concept discloses invention of patentable merit.

Our study of the alleged infringing devices convinces us that they come within the concept of Parsons and its mechanical embodiment. The transverse chains in these devices are not tight fitting and are not intended to be tight fitting, subject only to the circumferential movement that comes from hammering on the ground. What might be called the law of the structure prevents their being tight fitting. True, Parsons has no patent on the law of the structure as such. But he was the first to see the advantage of such a structure and to construct accordingly. And what he has done and patented cannot be trespassed upon with impunity simply because the law of the structure necessarily turns what, in pretense of appearance may be called a tight fitting device, into the loose fitting device. The decree of the Circuit Court is affirmed.

MIDGLEY DOES NOT INFRINGE.

(Continued from page 388)

ceeded with his metal stud idea, in one way and another.

By various citations the Examiner brought Mr. Adams to such a frame of mind that on January 8, 1897, he abandoned his metal stud idea and any broad claim covering the "interwoven wire form of bearings," and limited his application "to the combination with the cushioned tire of the interwoven wire bearing tread."

It is argued by defendant that Adams presented this idea to the public when he cut it out of his claims and devoted himself to the metal stud proposition. This is more or less persuasive, dependent upon the angle from which one views it, but I do not think the rights of the parties should turn upon that consideration.

We are still hunting for the breadth and scope of the mental concept which pervaded Dr. Adams's mind. At this last moment he is still thinking and arguing about his wire as being interwoven with the material of the tread, and in the new claim which he prepares and inserts he does not suggest the functional advantages which will accrue to his idea after the exposed portion of the interwoven wire has been worn through by frictional contact with the roadway.

He was thinking about bicycle tires, and if he had looked into the art at all, he must have found that others before him had

conceived the idea of stitching wire into a bicycle tire. Others had done it for other purposes, mainly to stiffen and strengthen their tires. It is not surprising that he should have thought that he could adapt their idea to his own use. (See Phillip's British Patent, 10,145, of 1893, and Barker's British Patent, No. 1,952, of 1888.)

That he could weave in his wire and make it useful to prevent slipping was the thought which came to him, and he proceeded to develop that thought in conformity with our statutes relating to patent discoveries. Assuming his idea to have been what I am confident it was, he complied with the statutes. Assuming it to have been what the plaintiff insists that it was, he failed completely to comply with them.

If one follows his disclosures, he could not get the wire into the tread in any other way than by weaving or stitching. There is not the faintest allusion to such a manner of treatment as the defendant applies to its coiled wire.

It is an easy thing to take such a structure as defendant's tire, made under the Midgley idea, and reason backwards to the Adams idea. By the time one reaches the Adams idea it has a very different aspect from the one reached by beginning with the art as it existed when Adams came into view, and working up to Adams through the light thus presented.

This memorandum is the outcome of many hours of careful thought and study of the case from every viewpoint. It would be a pleasant task to jot down my notions as they have come to me during those

hours, but time forbids and no useful purpose would be gained thereby.

In the light of the facts presented by the use of the heavy tires which must be applied to the ponderous motor car of the present day, a vastly different problem is presented from the one which Adams encountered from 1895 to 1898. It would be absurd, as well as highly inequitable, to so enlarge the scope of the answer which he made to his problem, that it would enable him to levy tribute upon those who have faced with courage a problem vastly larger.

He certainly failed completely to teach any one how to solve the larger problem, and for that reason alone, no matter what was in his mind, he failed to perform that end of his bargain which he was obliged to perform before he could expect the right of monopoly to which a properly prepared application, disclosure and claim would have entitled him.

Construing the patent as I feel bound to do, the defendant does not infringe.

Let the bill be dismissed with costs.

When Measurements May be Deceptive.

When gauging the amount of fuel in the gasoline tank with the elementary expedient of thrusting a stick down through the filler opening, it is well to observe whether the car is standing on level ground or whether it is inclined to one side or the other. If the car happens to be tilted, the result of the measurement may be deceptive, and the driver may find his supposedly full tank empty shortly afterward.

990,005. Non-Skid Device for Automobiles. Oscar Rash, Oakland, Cal. Filed Mar. 24, 1910. Serial No. 551,294.

A traction grip for tires comprising a cylinder, spoke engaging hooks having threaded stems slidably engaged with the cylinder, nuts engaged with the threaded stems for operation to adjust the hooks with respect to the cylinder, said cylinder having threaded recesses therein, spoke engaging members having threaded stems engaged in the recesses for adjustment of the members with respect to the cylinder, a plunger slidably engaged in the cylinder, means for holding the plunger yieldably projected, and a traction head carried by the plunger.

990,073. Front Driving Device and Steering Mechanism for Motor Vehicles. Merrick W. Sappington and Edward S. Hornbeek, Winchester, Ill. Filed Sept. 8, 1910. Serial No. 580,961.

1. In a front driving and steering mechanism for motor vehicles, a bearing member comprising an axle engaging sleeve, having a bifurcated outer end, an outer bearing section pivotally mounted on the bifurcated end of said sleeve, a hub revolvably mounted on said bearing member and having a round recess therein, a front driving axle arranged in said sleeve and having a spherical head projected into the recess in said hub, concentric rows of driving lugs arranged in the socket of said hub and having oval shaped outer faces and an annular series of driving lugs arranged on the face of said spherical axle head and having oval shaped outer faces and arranged to extend between and engage the adjacent faces of the double row of lugs in the hub socket whereby the wheel is driven and will be automatically held in straight course.

990,089. Jack. Le Roy Willour, Ashland, Ohio, assignor to The Ashland Manufacturing Company, Ashland, Ohio, a corporation of Ohio. Filed June 25, 1910. Serial No. 568,899.

1. In a lifting jack, a standard, a rack bar having slidable engagement therewith, a stud shaft rigidly mounted upon said standard, a disk rotatably mounted upon said stud shaft, having one side thereof provided with an involute thread and its opposite side provided with an annular flange carrying teeth upon its inner side, said disk being further provided upon its outer side with a hub portion cast integral therewith and rotatably mounted upon said stud shaft, a relatively small rotary adjusting lever rigidly connected with said hub portion, an operating lever having a head provided with an elongated slot to receive said hub portion, whereby said head is disposed between said disk and adjusting lever, and said operating lever carrying a tooth to engage said teeth upon said disk.

990,099. Power Transmission Mechanism. William Emil Bock, Toledo, Ohio. Filed Dec. 18, 1909. Serial No. 533,812.

1. In a power transmission mechanism, a guide, a frame mounted in said guide for rotary and longitudinal shifting movements, a drive shaft carried by said case and having a plurality of worm sections, a driven

member, means for locking the case against longitudinal movements when at one position of its rotary movements, and means for imparting rotary and longitudinal movements to the case to release the case and shift the shaft to selectively throw the worm sections into mesh with the driven member.

990,100. Power Transmission Mechanism. William Emil Bock, Toledo, Ohio. Filed Dec. 19, 1910. Serial No. 598,173.

1. In a transmission mechanism, the combination of a driven member, a plurality of worm sections shiftable relative to the driven member to selectively place the same in position to mesh therewith, and means operative to shift the driven member relative to the coacting worm section and to act thereon to oppose the thrust action of a meshing worm thereon.

990,101. Power Transmission Mechanism. Henry L. Bock, Toledo, Ohio, assignor to William Emil Bock, Toledo, Ohio. Filed Dec. 19, 1910. Serial No. 598,178.

1. In a power transmission mechanism, the combination with a driving worm, and a driven gear having roller teeth, of means for causing the roller teeth of the gear to have substantially uniform rotation relative to the gear body.

990,139. Cooling Fan for Explosive Engines. Edward A. Johnston, Akron, Ohio, assignor to International Harvester Company, a Corporation of New Jersey. Filed July 10, 1909. Serial No. 506,891.

1. A cooling fan for engines including, in combination, a fan shaft, a fan secured thereto, an engine shaft, motion transmitting means connecting said engine shaft with said fan shaft, including speed controlling mechanism, said speed controlling mechanism being actuated by the rotative movement of the fan.

990,190. Power Transmission Mechanism. William Emil Bock, Toledo, Ohio. Original application filed Dec. 18, 1909. Serial No. 533,812. Divided and this application filed May 27, 1910. Serial No. 563,730.

1. In a mechanism of the class described, the combination of a driven member, a plurality of gears revolvable bodily about a common axis which is angled relative to the axis of said member to permit a selective meshing of the same with the driven member, and means for driving the meshing gear.

990,203. Ball Bearing. Hermann Barthel, Schweinfurt, Germany. Filed July 11, 1910. Serial No. 571,451.

1. In a ball bearing, the combination with a plurality of balls, of a cage comprising two rings of U-shaped section secured back to back and having apertures for receiving said balls.

990,204. Ball Bearing. Hermann Barthel, Schweinfurt, Germany. Filed July 11, 1910. Serial No. 571,452.

1. A ball bearing of the character described, including a ring U-shaped in section, a second ring having lateral lugs engaging the first referred to ring and inwardly bent lugs forming abutments for the first referred to ring, said first referred to ring being pressed against said inwardly bent lugs, and concentric members between which are received said ring members.

990,214. Tire. Edward P. Beach, Freehold, N. J. Filed Oct. 20, 1910. Serial No. 588,014.

The combination of a vehicle wheel having a felly, with a resilient sheet metal container which is annular and has its outer periphery open, a resilient tread having sheets of stiff material of unequal widths secured to its inner side to form recesses on the opposite sides thereof, annular rings to enter the recesses and to bear on the container, screws securing the rings to the container, and an inner tube in the container and the tread when inflated.

990,249. Starting Vaporizer for Explosive Engines. Joseph F. Garcia and Harry Hertzberg, Brooklyn, and Abbot A. Low, Horseshoe, N. Y.; said Garcia and Hertzberg, assignors to said Low. Filed Oct. 7, 1907. Serial No. 396,158.

1. In a starting vaporizer, a mixing chamber, an air inlet thereto, a hollow vaporizing member composed of electrical resistance material, said member being open at its respective ends, means whereby an electric current is adapted to flow through said resistance material for directly heating said member, means for supplying a liquid combustible to one open end of said vaporizing member, and a baffle positioned externally to said vaporizing member and adjacent the other open end thereof.

990,263. Automobile. Louis Herman, Hillsboro, Mo. Filed Oct. 1, 1910. Serial No. 584,946.

1. The combination, with a frame, two driving shafts journaled longitudinally in the frame and arranged side by side, and means for revolving the said shafts; of friction driving disks secured on the said shafts, two cross shafts arranged in line with each other, slidable friction driving wheels splined on the said cross shafts and bearing against the said disks, beveled toothing pinions secured on the said cross shafts, steering levers pivotally supported by the said frame and arranged at the outer ends of the cross shafts and provided with axle spindles, road wheels mounted on the said spindles, beveled toothing pinions secured to the said road wheels, beveled toothing wheels connecting the said pinions in pairs, a connection between the steering levers, and rods operatively connecting the friction driving wheels with the steering levers, so that the road wheels are driven at unequal speeds in rounding curves.

990,293. Shock Absorbing Device. Emile Rimailho, Neuilly-sur-Seine, France, assignor to Societe Anonyme des Suspensions et Roues Flexibles, Paris, France. Filed Dec. 30, 1909. Serial No. 535,673.

1. In a shock absorber of the character specified, the combination with a member adapted to be secured to a fixed part of a vehicle, of a second member depressible relatively to said first named member, a shock absorbing element interposed between said members and becoming operative when the second member is depressed, a conical body movable with said second member, and a plurality of wedges disconnected and in frictional contact with said conical body and adapted to retard its return to initial position.

990,387. Tire Remover. Stephen C. Plant, Brookline, Mass. Filed Feb. 10, 1911. Serial No. 607,757.

1. A tire iron comprising a handle terminating in a claw, said claw being provided with a lateral extension arranged to co-operate with the inner side of the shoe, a hook pivoted to said handle and arranged to rest on the outer side of the wheel rim

to afford a fulcrum for the tire iron, and means having sliding engagement with said hook for preventing said lateral extension from slipping upwardly along the shoe.

990,456. Automobile Tire. Henry E. Rechner, East Toledo, Ohio. Filed Nov. 19, 1910. Serial No. 593,215.

1. In a device of the character described, a metallic spring clip formed with a curved portion adapted to be sprung over a tire, opposite internal flanges adapted to engage the tire, curved portions beneath said flanges and curved portions depending from said curved portions and each forming an outwardly curved flange.

990,462. Combination Lamp and Sign. John Dean Steward, Atlanta, Ga. Filed Nov. 11, 1909. Serial No. 527,489.

1. In a combined lamp and sign, the combination with a lamp body having an open front and side light-emitting means, a closure for the open front of the lamp body having a transparent sign, a bracket for supporting the lamp body, and side signs having supporting members supported from said bracket, said side signs being disposed across the path of rays from the side

light-emitting means and also arranged to be seen from the front of the lamp.

990,531. Antislipping Device. Oscar Falkenwalde, Baltimore, Md. Filed Oct. 21, 1910. Serial No. 588,335.

1. An anti-slipping attachment for vehicle wheels comprising a clamping device to clamp around the spoke of the wheel, said clamping device including projecting arms to embrace the wheel felly, said arms terminating in apertured ears, a tread engaging member and link rods pivoted between said ears and connected to said tread engaging member, said link rods being of a length to extend substantially half way upon the side of the tire.

990,541. Combined Handle and Lock for Vehicle Doors. Louis W. Gates, West Haven, Conn., assignor to C. Cowles & Co., New Haven, Conn., a Corporation. Filed Jan. 26, 1911. Serial No. 604,781.

1. A combination lock and handle for vehicle doors comprising a socket, said socket formed with a locking notch, a push button arranged in the socket opposite said locking-notch, a handle having a shank adapted

to enter said socket, a bolt mounted in said shank, key-operated mechanism mounted in said handle and adapted to move said bolt into its unlocked position, which bolt may also be thrown into its locking position by the push button.

990,604. Process and Apparatus for Scavenging Internal-Combustion Engines. Elbridge W. Stevens, Baltimore, Md. Original application filed July 16, 1909, Serial No. 507,925. Divided and this application filed Aug. 6, 1909. Serial No. 511,532.

1. The process of scavenging an internal combustion engine, which consists in introducing into the combustion chamber air currents at points of entry concentric to the axis of the cylinder and following this with other air currents also concentric to the axis of the cylinder but in a different coaxial zone.

990,618. Sliding Gear Transmission Mechanism. Alexander Winton and Harold B. Anderson, Cleveland, Ohio, assignors to The Winton Motor Carriage Company, Cleveland, Ohio, a Corporation of

PREST-O-LITE UPHELD IN TEXAS

Court Disagrees With Chicago Judgment and Grants Perpetual Injunction—Peculiar Status of the Patent Involved.

The Prest-O-Lite patent, No. 664,383, which within the course of one week of the present year, was the subject of two directly opposing opinions of two United States Circuit Courts, has been upheld by Judge Meek, sitting in the United States Circuit Court for the Northern District of Texas. He rendered his decision in the case of the Prest-O-Lite Co. against Charles E. Reib, doing business as the Searchlight Co. of Texas.

Reib claimed that he was operating under license issued by the Searchlight Gas Co. of Chicago to use its patent, but the court sustained the Prest-O-Lite allegation that the Searchlight patent is an infringement of their rights to not only the gas tank and the absorbent or solvent employed, but also their method of recharging the tanks. Accordingly Judge Meek granted a perpetual injunction against the Searchlight Co. of Texas and C. E. Reib, which forbids them to recharge Prest-O-Lite tanks—which was their chief business—and orders an accounting made of their profits. Damages will be awarded to the Prest-O-Lite company on the basis of such accounting.

The action of Judge Meek in sustaining the validity of the Prest-O-Lite patent, is in line with the judgment rendered by the United States courts in Wisconsin and Michigan, which, however, are directly opposed to the opinion of the United States Circuit Court in Chicago, which, some three months since, in the case of the Prest-O-Lite Co. against the Searchlight Gas Co. itself, ruled that the American patent had expired and that the Prest-O-Lite tank and all that pertains to it, were public property. This latter decision was handed down during the same week that the patent was

sustained in the Michigan circuit; a copy of it was rushed to the latter but that court declined to alter its opinion.

Woodard Leaves Diamond for Century.

Harvey J. Woodard, for the past five years manager of the Diamond Rubber Co. of New York, has resigned that office and on August 15th will become general manager of the Century Tire Co., whose factory is in Plainfield, N. J. Woodard's office, however, will be in New York. The Century company has been making what is termed a "custom-made" tire—one held to be better than the general run of tires and commanding a higher price—and although not generally known, its backing is of the sort that should assure it a position which Woodard's undoubted experience and energy should assist it in attaining. The president of the company is Daniel F. Shea, the partner of Thomas F. Ryan, the traction magnate; Allen Ryan, Mr. Ryan's son, is vice-president. The Barusch brothers, the New York bankers, also are interested in the enterprise. With such sponsors and such resources, Woodard's entry into the company presages a policy of real and immediate aggressiveness.

Enjoins Griffith's Use of "Imperial."

Having proved its right to the trademark "Imperial," as applied to tires, the McGraw Tire & Rubber Co., of East Palestine, O., has secured an injunction restraining its use by Edward C. Griffith, of New York, or anyone connected with him. Griffith has three company titles at his command and the injunction applies to all of them, viz.: Automobile Tire Co., Griffith Tire & Rubber Co. and Imperial Tire Co.

Schurmeier Trucks Prove Unprofitable.

The Schurmeier Motor Co., of St. Paul, Minn., which began the manufacture of trucks about a year ago, has filed a petition in bankruptcy. Its liabilities are \$51,899.79 and its assets \$33,288.34. The largest creditor is F. I. Whitney, president of the company, who as an individual holds its notes for \$25,361.08.

QUESTIONED QUALITY OF RUBBER

As a Result, Rubber Brokers Sue Michelin for \$157,925—Sheriff Levies Attachments, Which Soon Are Released.

Growing out of a difference of opinion concerning the quality of several shipments of rubber, early this week five attachments were placed on New York assets of the Michelin Tire Co., of Milltown, N. J., all of which, however, were released within 48 hours. The proceedings were the result of a suit against the Michelin company brought by Poel & Anderson, New York rubber brokers, for the recovery of \$157,925, which they claim as damages for alleged breach of contract and failure to accept several shipments of rubber, and a balance due on deliveries which had been made. The New York brokers charge that the Michelin company repudiated the contracts, which were made some time ago, at prices ranging from \$1.76 to \$1.98 per pound. The present price of rubber is about \$1.13.

When the Sheriff of New York county received the attachments he levied on the funds of the Michelin company on deposit in the Equitable Trust Co. and the National City Bank, amounting to \$202,141.30. A keeper also was placed in charge of the Michelin branch at 1763 Broadway, but he was quickly relieved and the attachments released when satisfactory guarantees were given by the Michelin company.

While newspaper reports made it appear that the trouble was due to the great drop in the price of rubber, which has occurred within the past year or so, J. Hauvette-Michelin, vice-president of the Michelin company, yesterday stated to a Motor World man that the legal proceedings were due solely to a difference of opinion concerning the quality of the rubber, some of which was delivered six months or more ago and which still remains unused in the Michelin warehouse

at Milltown, because of its alleged inferior quality.

"When we placed the contracts," said Mr. Hauvette-Michelin, "we specified the Michelin quality of rubber. The stock which was delivered to us we did not consider up to our standard and we have refused to accept or use it. The alleged breach of contract is due solely to a difference of opinion as to quality and not price, and we are quite content to have the courts pass on the matter."

Fight for Commission Leads to Law.

There was entered in the New York Supreme Court last week a judgment for \$3,329.87 in favor of the E. R. Thomas Motor Branch Co., of New York, against the S. & V. Motor Co., of Brooklyn, the evidence in the case showing that on March 29th last the S. & V. company gave to the plaintiffs a check for \$3,282.09 in payment for a Thomas car valued at \$4,000, less 20 per cent. commission, and that the check had been stopped before it was cashed. When the Thomas company entered suit for the amount the S. & V. company filed a counterclaim alleging that on February 10, 1910, the Thomas company contracted in writing to give the defendants the exclusive sale of all Thomas cars in Brooklyn and to pay a commission of 20 per cent. of the gross price, and that notwithstanding between December 1, 1910, and April 14, 1911, the Thomas Branch company sold to residents of Brooklyn ten cars, for which they received \$40,000, of which amount the S. & V. company claims 20 per cent., or \$8,000, as its commission. The Thomas Branch company entered a general denial, and the attorneys for both sides consenting, judgment was entered for \$3,282.09, plus interest and costs. The S. & V. company, which is winding up its affairs, has entered suit for the \$8,000, which it claims as its due, and this suit still is pending.

Readjusting Maytag-Mason Affairs.

In an effort to readjust its finances and to effect reorganization a committee of creditors has interested itself in the affairs of the Maytag-Mason Motor Co., of Waterloo, Ia. Pending the result of these efforts the factory has shut down. It is stated that the company's liabilities exceed \$370,000, but that its assets total \$600,000. The chief creditors are former Senator F. L. Maytag and William Galloway, a large manufacturer of Waterloo, who has endorsed the company's paper for large amounts.

Spokane Jobbers Forming Association.

Nine automobile tire dealers and accessory jobbers of Spokane, Wash., have formed the Spokane Automobile Accessories Association. No officers have been elected as yet but the affairs are in the hands of Fred Kitson, of Child, Day & Churchill, and Louis Cavanaugh, of the

Chanslor & Lyon Motor Supply Co., who are drafting the constitution and by-laws on lines similar to those of the Spokane Retail Automobile Dealers' Association. The members are: Nott-Atwater Co., Washington Rubber Co., Child, Day & Churchill, Chanslor & Lyon Motor Supply Co., Interstate Rubber Co., W. H. Alexander, William S. Smith Rubber Co., Engbam Tire and Rubber Co. and the Diamond Rubber Co.

Changes Among Prominent Tradesmen.

E. E. McLeish has been appointed advertising manager for the Paige-Detroit Motor Co., of Detroit. Previously he served the Regal Motor Car Co. in the same capacity.

George S. Simpson has been appointed manager of the Fisk Rubber Co.'s branch in Atlanta, Ga. Previously he was a member of the firm Poling & Simpson, of Baltimore, Md.

E. C. Johnson has resigned the vice-presidency and sales management of the Louis J. Bergdoll Motor Co., of Philadelphia, and entirely retired from participation in its affairs.

E. L. Jones, who has been in the Remy service in the Middle West for the past two years, has been appointed manager of the Remy Electric Co.'s Indianapolis branch. He succeeds John G. Wallick, who has gone into the retail trade in that city as manager of the Meriden Automobile Co.

C. F. Krueger, who previously was connected with the Studebaker interests, has been elected vice-president and general manager of the Standard Electric Car Co., of Jackson, Mich., which recently was organized and which will place a popular-priced shaft-driven electric on the market about September 1. J. D. Forrer, a former Westinghouse engineer, also has been added to the Standard company's staff.

Harry W. Anderson, for the past two years a district manager for the Regal Motor Car Co., has been appointed Southern sales manager for the American Motors Co., of Indianapolis, and will have full direction of the sales of the American underslung car in all of the Southern states except Texas. Anderson for many years was engaged in the machinery business in the South and "knows it like a book."

Indiana Car Manufacturers Organize.

The Indiana automobile manufacturers who took part in the Four States tour to promote the products of the Hoosier State have formed the Indiana Automobile Manufacturers' Association. The officers for the first year are: President, Frank Smith, of the Maxwell company, who was chairman of the Four States tour; first vice-president, Will H. Brown, president and general manager of the Mais Motor Truck Co.; second vice president, V. F. Whitesides, of the Whitesides Motor Truck Co.; third vice president, George M. Dickson, general manager of the National Motor

Vehicle Co.; fourth vice president, Howard C. Marmon, of the Nordyke & Marmon Co.; fifth vice president, George A. Weidley, vice president of the Premier Motor Mfg. Co.; secretary, P. P. Willis, of the Mais Motor Truck Co.; treasurer, Fred N. Coates, of the Lexington Motor Car Co.

New York City Settles Mitchell's Claim.

Judgment in favor of the Mitchell Motor Co., of New York, for \$3,223.40 has been entered against the City of New York, the amount representing settlement of a claim of the Mitchell company for the use of two runabouts and two touring cars, valued at \$5,822.50, which were delivered to the city on March 26th, 1909. Since that date the Mitchell company alleged that the cars had been used continuously and had been damaged by such use to the extent of upwards of \$2,500. Their demand for the return of the cars and payment of the amount of damage and depreciation had been ignored by the City Comptroller, hence the suit, which led to the judgment. When the case was brought to trial the Acting Corporation Counsel of the city offered the Mitchell company \$3,223.40, without interest or costs, and the offer was accepted and the case settled.

Bosch Now Taking On Distributors.

Departing from its former policy of handling all of its sales from its headquarters in New York or through its branch houses, the Bosch Magneto Co. now is appointing territorial distributors wherever such distributors can prove themselves qualified to handle the business. A striking sign for display by the distributing houses goes with each appointment.

Kelly-Racines Placed on Pacific Coast.

The Chanslor & Lyon Motor Supply Co., of San Francisco, has been appointed Pacific Coast distributor of the Kelly-Racine tires, made by the Kelly-Racine Tire Co., of Racine, Wis. The Chanslor & Lyon company maintains branches in the several more important cities on the coast and will carry full stocks of the goods and push them aggressively.

Simplex Going to New Brunswick.

Due largely to labor troubles in New York, the Simplex Automobile Co. will remove, about November 15th, to New Brunswick, N. J., where it has begun the construction of a reinforced concrete factory which will cost \$100,000. It will be a two-story structure, 66 x 392 feet, yielding over 40,000 square feet of floor space.

Standard Welding Takes Over West.

Having terminated its contract with L. F. McClernan, of Chicago, the Standard Welding Co., of Cleveland, henceforth will handle its Western business directly from the factory. The company's own men will cover the territory previously handled by McClernan.

JUNE GIVES IMPORTS SLIGHT UPLIFT

Three More Cars Imported, but Net Loss Still Continues—Shrinkage During Fiscal Year Nearly \$1,000,000.

June, 1911, contained more hope for the importing trade than any month has held during a period of several years, or since the imported car lost its hold in this country. The hope rests in the fact that three more cars were brought in in June, 1911, than were imported during the corresponding month of the previous year—117 cars, as against 114—their respective values being \$256,514 and \$233,229. The increase, however, is more apparent than real, the month's decline in the value of parts much more than offsetting the gain in cars. The imports of parts dropped from \$75,569 in June, 1910, to \$15,748.

Although the total number of cars and their value practically has remained the same as in the same period of last year, important and significant shifts took place in the respective numbers, each of the importing countries has sent to America. France was the only loser, registering a falling off of 32 cars, or \$53,144 worth, while Germany showed a corresponding increase of 24 cars, valued at \$40,646. Small gains also were recorded by the United Kingdom, Italy and Other Countries.

The figures for the fiscal year ending June 30, 1911, show a loss of 605 cars, valued at \$953,603; Germany, France and Italy being on the losing side, with England and Other Countries registering small increases. During the year there were imported 888 cars, valued at \$1,898,843, as compared with 1,473 cars, valued at \$2,851,446 in the same period of 1910.

Horns are Horns, Declare Appraisers.

Shipping the rubber parts of an article in one package and the metal parts in another does not change the nature of the complete article or serve to lessen the duty on either part of it. This, in effect, is the decision of the Board of General Appraisers for the Port of New York, which was rendered last week on an appeal filed by M. L. Eckstein & Co. involving the duty levied by the Collector of the Port on a shipment of automobile horns, the parts of which had been packed separately. In the decision the Appraisers say:

"The invoices in these cases describe the goods as 'automobile horns' and 'metal-mounted rubber bulbs.' The shipments comprise horns and bulbs coincident in number, arriving for the same importer, on the same steamer, and these horns with the bulbs therefor constitute in fact complete units. The collector treated these articles as entireties and assessed duty thereon at 45 per cent. ad valorem under the provi-

sions of paragraph 199, tariff act of 1909. The importers claim that the rubber bulbs are separately classifiable as manufactures of India rubber (paragraph 483). The board passed on articles of this precise kind here in question in G. A. 7,219 (T. D. 31,567), and the ruling in that case is decisive of the issue here raised. Following the decision referred to we overrule these protests and affirm the collector's assessments in question."

Saxon Lamp in Hands of Receiver.

Alleging that the company is insolvent and had made preferential payments and transferred merchandise and accounts, three creditors on Monday last, 7th inst., filed a petition in bankruptcy against the Saxon Lamp Co., 530 West Twenty-eighth street, New York, and Alan Fox has assumed charge as receiver. The petitioning creditors are the Clover Paper Co., \$300; New York Buff Co., \$115, and Rockwell C. J. Barker, \$115. Liabilities are said to be \$12,000 and assets \$1,500. The business was started in 1889 by Herman Saxon and was incorporated in May, 1909, with capital stock \$5,000, which was increased to \$50,000 in March, 1910, when Saxon became president. Business has been dull for the past six months and the plant, it is said, has been closed for a month or more.

Creditors Make Charges Against Rothstein.

The Rothstein Mfg. Co., which produced automobile supplies at 1955 Park avenue, New York, has been petitioned into bankruptcy by these creditors: Electrore Mfg. Co., \$230; Phoenix Tube Co., \$235, and Smith & Loughlin, Inc., \$87. It is alleged that the company is insolvent and has removed and concealed assets of over \$1,000, and on July 25 permitted a creditor to obtain a judgment against it. The probable assets are estimated at \$5,000. The company was incorporated on March 23, 1908, with capital stock of \$500.

Mosler Building Factory in Yonkers.

A. R. Mosler & Co., makers of the Spitfire spark plug, have commenced the erection of a factory building on 241st street, Wakefield Park, Yonkers, N. Y., which will be ready for occupancy on December 1st, on which date the present Mosler plant on West 29th street, New York City, will be vacated. The factory in Yonkers will be equipped for all manner of machine work and will permit Mosler & Co. to produce several new lines of goods.

Nebraska Factory to Change Location.

Ground has been broken in Nelson, Neb., for a concrete factory building, 70 x 100 feet, which will be occupied by the Angus Automobile Co., of Angus, Neb., in which residents of Nelson have purchased a controlling interest. The machinery, which will be added to, will be removed from Angus as soon as the building is ready.

WHEN LEARNED JUDGES DISAGREE

Sustaining Grant Tire, Judge Ray Declares Indiana Decision Not Binding—Discusses Interference with Customers.

Although the Grant patent, No. 554,675, covering the solid rubber tire in which separate and independent retaining wires are employed, has been held to be valid by the Supreme Court of the United States, that decision did not put an end to the litigation in which it so long had been involved. It again was the issue in a suit brought by the Grant interests against William Seim and Gustave Reissig, which was heard by Judge Ray, sitting in the United States Circuit Court for the Northern District of New York, in Utica, and which just has resulted in further affirmation of the Grant rights.

The case was unusual and of wide importance in that it involved tires alleged to have been made in Kokomo, Ind., in which circuit the United States court several years ago—and, of course, before the Supreme Court rendered its decision in April last—had ruled that the Grant patent was invalid, which tires were sold in New York state to Seim and Reissig by the Diamond Tire Co. of New York, for which territory James D. Hurd held an exclusive license under the Grant patent issued by the owners thereof, the Consolidated Rubber Tire Co. and the Rubber Tire Wheel Co., who, with Hurd, were the complainants in the case. They applied for a temporary injunction restraining Seim and Reissig and the Diamond Rubber Co. petitioned to be made a party defendant. Judge Ray ruled in favor of the complainants on all points and also broadly intimated that the tires in the case had not been made in Kokomo; in vigorous language he held that though the decision of the Circuit Court in Indiana may permit the sale and use in that circuit of tires made by the Kokomo Rubber Co., it does not protect the sellers or users of Kokomo tires in any other circuits. While there is nothing novel or surprising in this decision, Judge Ray carried his opinion further and expressed the belief that the decree in the Kokomo case "conferred and confers no right on the Kokomo company to perpetually and forever infringe the Grant patent now that it has been held valid by the Supreme Court of the United States, whose decision must be the supreme law of the land."

From the purely commercial standpoint the rights or scope of a patentee to interfere with the business of a maker of an alleged infringing device by bringing suits against the latter's customers, which point was quite thoroughly discussed by Judge Ray, is perhaps of wider and more vital interest than the main issue. Pointing out

that "there is a wide distinction between holding that a patent is invalid and holding that a certain manufacturer does not infringe such patent," he indicates wherein such actions may constitute wrongful interference with a man's business and also wherein they may be justifiable.

The decision in full is as follows:

This is a suit in equity brought by the complainants to restrain the defendants, Seim and Reissig, from infringing what is known as the Grant patent, dated February 18, 1896, No. 554,675, and issued to Arthur W. Grant for "Rubber-tired Wheel." The validity of this patent has been adjudicated in certain circuits and its invalidity has been adjudicated in other circuits. It was held valid in the second circuit by the circuit court and also by the Circuit Court of Appeals in Consolidated Rubber Tire Co. & Rubber Tire Wheel Co. v. Diamond Rubber Co. of New York. In this case on the petition of the Diamond Rubber Company a writ of certiorari was granted and the case taken to the Supreme Court of the United States where the patent was held valid and infringed. See Diamond Rubber Co. of New York, petitioner, v. Consolidated Rubber Tire Co. and Rubber Tire Wheel Co., decided April 10, 1911 (not yet reported).

So far as this suit between the parties is concerned the patent must be considered valid. It has the presumption of validity to start with and the decision of the Supreme Court of the United States sustaining it. However, in Goodyear Tire and Rubber Co. et al. v. Rubber Tire Wheel Co., sixth circuit, the patent was held invalid and in Rubber Tire Wheel Co. v. Victor Rubber Tire Co., sixth circuit, it was also held invalid. In a case in the seventh circuit, District of Indiana, where the Kokomo Rubber Company was defendant, the patent was held invalid. This last case did not go to the Circuit Court of Appeals.

The defendants here, Seim and Reissig, reside and do business in the city of Albany, State of New York, second circuit. It seems to be their contention that they purchase the alleged infringing articles in which they deal and which they sell from or through the Diamond Rubber Company of New York, which in turn obtains them from the maker, the Kokomo Rubber Company. In the case above referred to in the Circuit Court of Appeals, second circuit, and which went to the Supreme Court of the United States as stated, the Circuit Court of Appeals inserted the following in the decree:

"Ordered, Adjudged and Decreed

"That the decree of said Circuit Court be and it hereby is amended by inserting the following clause:

"Nothing in this injunction shall prevent or is intended to prevent or enjoin this defendant from handling, using and selling rubber tires and rims covered by the Grant patent, manufactured by the Goodyear Tire & Rubber Company, having a right to manufacture, use and sell such tires, under a judicial decree in the Federal Courts of the Sixth Circuit, or manufactured by the Kokomo Rubber Company, having a right to manufacture, use and sell such tires under a judicial decree in the District of Indiana, Seventh Circuit; or manufactured by the Victor Rubber Tire Company, under a judicial decree in a litigation in the Federal Courts in the Sixth Circuit, where in such litigations it has been judicially determined that the said Grant patent is invalid and void."

"And as so amended is affirmed with costs taxed at the sum of \$31.95."

The defendants here as well as the Diamond Rubber Company of New York, contend that inasmuch as the decree was affirmed with this clause therein, there has been an adjudication that the Diamond Rubber Company has the right to use and sell rubber-tired wheels and the various parts which go to make up the rubber tired wheel or the patent manufactured by the Goodyear Tire and Rubber Company, or by the Kokomo Rubber Company, or by the Victor Rubber Tire Company, the patent having been held invalid as to them. The contention is that this right extends to all dealers and users

(Continued on page 487.)

Detroit, Mich.—Richardson Auto Garage Co., under Michigan laws, with \$2,500 capital; to operate a garage.

Rock Island, Ia.—The Black Hawk Motor Co., under Iowa law, with \$50,000 capital; to manufacture motors, motorcycles, etc. Corporators—H. S. Dickinson, Ardo Mitchell.

Sheffield, Ala.—Tri-Cities Garage Co., under Alabama laws, with \$20,000 capital; to operate a garage and repair shop. Corporators—E. E. Doud, E. C. Carter, Mrs. E. C. Carter.

Milwaukee, Wis.—Smith-Hoppe Auto Co., under Wisconsin laws, with \$15,000 capital; to deal in automobiles and accessories. Corporators—Jesse A. Smith, A. C. Hoppe, C. C. Russell.

Chicago, Ill.—W. A. Paterson Co., under Illinois laws, with \$2,500 capital; to manufacture and sell automobiles. Corporators—Edgar C. Fredy, William B. Herrick, Lyle A. Closter.

Dallas, Texas.—The Auto and Carriage Supply Co., under Texas laws, with \$3,000 capital; to deal in accessories and supplies. Corporators—George T. Mahan, Harry Wheatley, M. Zauf.

Indianapolis, Ind.—Fashion Garage & Auto Co., under Indiana laws, with \$10,000 capital; to operate a garage and deal in automobiles. Corporators—B. D. Gilson, W. L. Higgins, J. L. Edwards.

Watertown, N. Y.—Watertown Transportation Co., under New York law, with \$25,000 capital; to operate motor buses and automobiles. Corporators—D. M. Anderson, W. F. Herring, J. M. Gamble.

Muskogee, Okla.—Hudson Motor Sales Co., under Oklahoma law, with \$5,000 capital; to deal in automobiles, motor trucks and accessories. Corporators—J. V. Thomas, E. J. Phelps, C. A. Lockard, Jr.

Denver, Colo.—The Auto Hire Co., under Colorado laws, with \$10,000 capital; to do an automobile transfer and livery business. Corporators—R. E. Oakes, A. H. De Guston, Homer Elliott, all of Denver.

Toledo, Ohio—Saxon Mfg. Co., under Ohio laws, with \$10,000 capital; to deal in automobile supplies. Corporators—Herman Saxon, Charles G. Cunningham, Richard D. Logan, T. A. Koster, Phyllis Sackett.

Cleveland, Ohio.—The Abbott-Detroit Sales Co., under Ohio laws, with \$20,000 capital; to deal in automobiles. Corporators—O. D. Eshelman, R. E. Deacon, R. E. McClellan, Ada N. Jackson, F. E. McClellan.

New York City, N. Y.—Brown Speedom-

eter Co., under New York laws, with \$200,000 capital; to manufacture speedometers. Corporators—A. B. LaFar, G. P. Cooper, of New York City; W. L. Brower, of Maplewood, N. J.

Syracuse, N. Y.—The Lane Auto Association, Inc., under New York laws, with \$10,000 capital; to manufacture and deal in motor vehicles and maintain a garage. Corporators—Anna L. Lane, Bradley J. Lane, Earl R. Elmer.

Toledo, Ohio.—The Saxon Manufacturing Co., under Ohio law, with \$10,000 capital; to deal in automobile accessories and supplies. Corporators—Herman Saxon, Charles G. Cunningham, Richard D. Logan, E. A. Koster, Phyllis Hackett.

Chattanooga, Tenn.—Auto Electric Co., under Tennessee laws, with \$10,000 capital; to do general electric work and maintain an electric garage. Corporators—E. B. Walzl, W. B. Royster, A. C. Carroll, A. C. McClellan, Frederick Geddings.

Warwarsing, N. Y.—The New York Fritchie Co., under New York laws, with \$200,000 capital; to manufacture and deal in all kinds of motor vehicles. Corporators—D. O'Connor, A. Sheard, H. A. Fluckiger, all of New York City.

St. Louis, Mo.—St. Louis Truck and Manufacturing Co., under Missouri laws, with \$5,000 capital; to manufacture and sell motor trucks and other vehicles. Corporators—Rosa A. Koehler, 28 shares; Frank G. Koehler, 2 shares; George H. Martin, 20 shares.

Louisville, Ky.—Victor Motor Accessories Co., under Kentucky laws, with \$2,500 capital; to deal in automobile accessories and other equipment for motor vehicles. Corporators—D. W. Reinohl, 7 shares; Clarence F. Ott, 9 shares; Alfred W. Ott, 9 shares.

New York City, N. Y.—Cab & Taxi Co., under New York laws, with \$1,700,000 capital; to acquire business of the above named company, to do livery and motor service. Corporators—G. H. Fitzgerald, Brooklyn; E. C. Kaestner, J. F. Manheimer, New York City.

Elmira, N. Y.—American Standard Auto-Car Lift Co., under New York laws, with \$25,000 capital; to manufacture device for lifting and supporting wheels of automobiles and motorcycles. Corporators—R. D. Webster, Dr. M. E. Saefuse, P. C. Thompson, all of Elmira.

Toledo, Ohio.—The American Motor Truck Delivery Co., under Ohio laws, with \$150,000 capital; to operate motor trucks under the name of the A. M. T. Delivery. Corporators—E. A. Mallory, C. E. Tucker and Clarence B. Hadden, of Toledo; Dwight Smith and M. D. Neff, of Findlay, Ohio.

Increase of Capital.

Galion, Ohio.—The Ditwiller Manufacturing Co., from \$50,000 to \$100,000.

Charles Hopkins has opened a garage and repair shop in Manistique, Mich.

Potomac, Ill., soon will have its first garage. Wilbur H. Goodwine is building it.

William G. Krauthoeffer is building a garage on North avenue, near Buffum street, Milwaukee, Wis. It will cost \$2,500.

Frank R. Houghton is erecting a three-story garage at 246 West Sixtieth street, New York City, N. Y. It is to cost \$15,000.

Eli Mead, who conducts a livery stable in Westport, Conn., has added automobiles to his stock. He has built a garage adjoining his stable.

O. E. Gorderman has opened a two-story brick and concrete garage on West Franklin street, Hagerstown, Md. It will house Hudson and Maxwell cars.

H. W. Hopewell and E. C. McCormick have formed a company with \$10,000 capital for the purpose of operating an automobile livery service in Sioux City, Ia.

The La France Garage Co., Elmira, N. Y., which was incorporated last week, has opened a garage and repair shop at the corner of Carroll and Fox streets.

George A. Bond has opened salesrooms in Kansas City, Mo., where he will display Krit cars. In addition to dealing in cars he will sell supplies and accessories.

The Utica (N. Y.) Auto Supply Co. has opened a store at 231 Genesee street for the sale of accessories and supplies. The company also will handle the Krit car.

Earle C. Anthony is constructing a four-story, reinforced concrete garage at 1000 South Hope street, Los Angeles, Cal. The building will cost, when finished, \$70,000.

The Tri-Cities Garage Co. has been organized in Sheffield, Ala., with a capital of \$20,000. E. C. Carter is the manager of the new concern, which will operate a general garage and livery business.

The Foley-Thompson Automobile Machine Shop is the style of a new company which has "opened up" in Mobile, Ala. It will make parts and replacements for all kinds of motor cars and do a repair business.

The Louisiana (Mo.) Auto Co. has discontinued business and its building, including stock and equipment, is for rent. St. John and Orthwein, the partners, have been running the business at a loss for some time.

John M. Leaman, who for four years was connected with the Jonas Automobile Co., Milwaukee, Wis., has gone into business on his own account and opened salesrooms

in the Majestic building. He will handle Mack trucks.

The West Side Garage Co., of Green Bay, Wis., has found its quarters too crowded and moved into a more spacious building on North Broadway. The new structure is 100 x 45 feet, and will accommodate twenty-five cars.

H. J. and E. S. Linesmith, who conducted a garage and salesroom at Lima, Ohio, under the style H. J. Linesmith & Co., have filed a voluntary petition in bankruptcy. Their assets are \$4,178 and their liabilities \$7,395.04.

L. J. Borie, western distributor of Metz cars, has found his salesrooms too small for his needs and has secured an entire building on Golden Gate avenue, San Francisco, Cal. He will place agents throughout the entire state.

B. W. Griffin, formerly manager of the Canada Life Insurance Co., has taken the agency for Lauth-Jergens motor trucks and opened headquarters in the Twenty-second Street Garage, Toledo, Ohio. He will cover Lucas, Ottawa and Wood counties.

The Pioneer Automobile Co., of San Francisco, Cal., has relinquished its agency for Hudson cars in favor of S. G. Chapman. In addition to handling Hudson cars, Chapman is acting as distributor for Oakland, Abbott-Detroit and Hupmobile cars.

W. R. Waters has opened a garage at 410 Mound street, East Davenport, Ia., under the style Greater Davenport Auto Co. He will handle the McFarlan car and do general repairing and rebuilding in his own forge shop, which adjoins the garage.

The Gomery-Schwartz Motor Car Co. is the style of a new concern which has opened temporary quarters at the corner of Fifth and Orange streets, Wilmington, Del. G. R. Wright is the manager of the company, which will handle the Hudson exclusively.

Under the style the Cedar Valley Auto Garage, Albert Belt, who conducted a salesroom and garage in Sycamore street, Waterloo, Ia., has sold his interests and moved to Oelwein, in the same state, where he has opened a salesroom. He handles the Buick car.

The Cadillac Motor Sales Co. is the style of a new company which has been formed at Dayton, Ohio, with H. M. McCord as manager, and salesrooms at 216 West Third street. Until the building is finished, temporary quarters have been engaged at the Conover building.

Francis P. Blair, formerly with the United Motor Washington Co., has gone

into business on his own account and purchased the Carpenter Garage, at the corner of Seventeenth and U streets, N. W., Washington, D. C. He will open it to the public on September 1.

Eugene F. Bates, of Greenville, S. C., whose garage and repair shop was destroyed by fire a few months ago, together with several motor cars, is building a much larger garage on West North street. The new building will be of brick, one story high and will be fitted with all modern conveniences.

At an estimated cost of \$20,000, the Iowa Auto & Supply Co., of Des Moines, is building a two-story garage on the lot adjoining its present garage on Fourth street. The addition will be of brick and steel, 66 x 132 feet, and will give the company 30,000 square feet of floor space, making it the largest garage in the state.

Maynard, Ketchum & Maynard, who operated a garage and supply store in Yankton, S. D., under the style Yankton Auto Supply Co., have disposed of their business to the Von Donselaar brothers, who will continue it under the old name. The new owners will add an automobile livery and renting service to their other interests.

Incorporated under the laws of Ohio, with a capital of \$150,000, the American Motor Truck Delivery Co. has opened temporary headquarters at 1126 Ohio building, Toledo. The company intends to do a general trucking and express service, and has purchased ten Ewing trucks for that purpose. E. A. Mallory, formerly of the Banting Machine Co., is the manager.

The McAllister-Newgard Co., the first taxicab company in Minneapolis, Minn., has filed a voluntary petition in bankruptcy, with assets of \$14,712.50 and liabilities of \$60,945.07. The liabilities include, among others, \$30,972 loaned to the company by Julius Newgard, \$8,000 loaned by two Minneapolis banks, and a damage suit for \$10,200 instituted by one Harriet H. Heller. Failure of well known business men of the city to pay their taxicab bills is one of the reasons for its embarrassment given by the concern.

Recent Losses by Fire.

Brookport, Ill.—Ford Garage and two cars burned. Loss, \$3,000.

Pender, Neb.—John Albertson's garage and two cars burned. Loss, \$4,000.

Portland, Ore.—Frank Bennett's garage, Fourteenth street, and six automobiles burned. Loss, \$15,000.

Stevens-Duryea

1912 Cars
Now Ready

The Seventh Year of Successful Sixes

The Stevens-Duryea Six with its more than six years of successful use and the known record of those years needs no wordy compliments.

When we began making Sixes in 1905 we met prejudice and opposition—but after six years we note that some of those who disliked and disbelieved in the Six in those days are now manufacturing Sixes.

So many Sixes sprung up following that early Stevens-Duryea Six that the world knows the Stevens-Duryea Six in 1905 must have been a big success—else why the followers?

The basic reason for the success of the

Stevens-Duryea Six is its "Unit Power Plant" Supported on Three Points. This principle and construction is of especial value in the Six cylinder car.

The weight reduction feature of the "Unit Power Plant" is particularly useful with a 6-cylinder motor, while the "Three Point Support" practically insulates the long Six power plant from the twisting, racking strains of the frame and allows it to deliver, therefore, full power to the rear wheels.

This construction is in great favor with other manufacturers. It is being widely adopted. You cannot have followers without a leader somewhere in the foreground.

Postage Stamps will be accepted in payment for subscriptions, but not for advertisements. Checks, Drafts and Money Orders should be made payable to The Motor World Publishing Co.

General Agents: The American News Co., New York City, and its branches.

Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

Contributions concerning any subject of automobile interest are invited and, if acceptable, will be paid for; or, if unavailable, will be returned provided they are accompanied by return postage.

To Facilitate Matters All Communications
 Should Be Addressed to P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, AUGUST 10, 1911.

Factor of Safety Unwittingly Supplied.

It remains to be generally appreciated that the long-desired advantages of an automobile control system that is accessible to one of the passengers as well as to the driver at length has been achieved, though unwittingly, and by several manufacturers. For two important reasons this is a useful feature. The first is that it places the means of driving within reach of two persons instead of one. Thus in the event of the sudden disability of the driver, such as may arise through illness, shock or accident, the passenger may be enabled to stop the car, or even to drive it for considerable distances. The second advantage is that while teaching beginners in the art of driving the instructor may have the car at command at all times without inconvenience to himself and without the use of special fittings.

During the present season several distressing accidents have occurred as the re-

sult of the indisposition of the driver of a car. In two or three cases examination after a fatal accident has revealed the fact that the driver was dead of heart failure before the car ran off the road or overturned. Faintness, nervous shock arising from an unexpected contingency, the bewilderment that is occasioned in the same way, a blow in the head as from an overhanging obstruction, and, painful to relate, intoxication—all are other possible, though by no means rare, causes of momentary or prolonged aberration. It is quite often possible that such causes have contributed to more mysterious mishaps of the highway than ever the much-maligned steering gear or the "exploded" tire could begin to account for.

Hitherto the only emergency recourse of the passenger in front has been to the clutch pedal, the ignition switch and the steering gear; an agile person also might crawl out from the rear of the car on the driver's side and apply the emergency brake, thereby also disengaging the clutch. Yet none of these possibilities have proved really effective in critical moments.

With what in many respects may be termed the most approved method of control mechanism arrangement, however, the double control really may be said to have been attained. It is true that this was not the object sought in making the change, that it is an advantage purely incidental to other advantages, which, for the moment, occupied the mind of the designer, but that does not in the least interfere with the principle, which is well worthy of thought.

How has the double control been attained? By the simple expedient of placing the gear-shifting and emergency brake levers in the center of the foot board.

Motor Vehicles for Military Uses.

It may be observed that a new influence is beginning to be felt in the motor truck industry, one that promises—or, perhaps it might be said, threatens—to become increasingly manifest in the future. Hitherto the industry has looked forward wistfully to the big market that would be thrown open when motor vehicles at length should find a lasting place in the war armament of the nations. That recognition of its advancement to a practical stage at length has been granted and there is every present prospect that the employment of military motor cars will continue to increase. Furthermore, the influence of military re-

quirement already is beginning to be revealed in design.

Especially is this the case in France and Germany, where the subsidy plan offers tremendous encouragements to manufacturers who follow the suggestions of the army authorities in respect to design. As the matter stands the manufacturer has everything to gain and apparently nothing to lose by following the army rules. The truck that is built in conformation to certain requirements and which successfully passes the test of the severe military trials receives government sanction. Its purchasers obtain a not inconsequential bonus at the time of purchase and an annual emolument for several succeeding years. In its semi-official capacity the approved type is certain to enjoy considerable prestige, an advantage which its manufacturer is likely to seek to extend to vehicles of other types which he also produces. The evident tendency is toward a convergence of types and a commercial movement which inclines very much toward an ultimate monopoly.

A more natural view of the matter is that the adoption of motor vehicles for military purposes involves a healthy trend toward standardization, not only of structural parts but of bodies and equipment as well. The pattern of vehicle approved by government authorities is almost certain to be copied extensively by makers who do not succeed in winning official approval with their own constructions, and the public is apt to be favorably disposed toward it.

The contrast is that between standardization by dictation and standardization by commercial and scientific requirement. The type best suited to army needs, particularly in the field, may not be, and, it is not unfair to say, probably will not be, the type best suited to commercial needs. The military requirement is for a vehicle that will stand full-load service over military roads or no roads at all. The endurance requirement, therefore, is far greater than that of the commercial machine, which is destined to be employed under constantly improving highway conditions. The foreign builders at present are progressing in the direction of heavier construction, slower speeds, steel tires—at least as far as the army trials reveal commercial tendencies. These features, however, do not fit in with the commercial requirement of this country, however well they may accord

with Continental and British business needs.

In this country, with no immediate prospects of subsidized production and with the military authorities none too active in encouraging the development of the army truck, the influence of the war automobile has not yet begun to appear. At the same time one manufacturer already has been commissioned to construct a special army escort wagon in co-operation with the authorities, thus evidencing the feeling that the commercial standard and the army standard are not comparable. This is undoubtedly a well-grounded sentiment. The only danger is that the idea may become current that what is suitable for army work is equally suitable for the uses of commerce. The likelihood of such an impression originating in this country is extremely remote, but with the influence of foreign design still evident in the American draughtsman's work there is reason to guard against a misapplication of military specifications.

With due respect for the New York City magistrate who ruled that it is not an offense to drive at the rate of 27 miles an hour on the thoroughfares of the city, provided only that they are free or nearly free of traffic, it may be remarked that until human eyes are able to see around corners, no speed approximating a mile in two minutes is suggestive of the "careful and prudent" pace defined by the New York law, technicalities to the contrary notwithstanding. It is not enough to have a clear road ahead. The possibilities of traffic emerging from cross streets must be considered in reckoning prudent rates of speed. No one knows better than the careful motorist the peril that lurks in such directions, nor the number of "close shaves" that are of almost daily occurrence. Motorists probably will be the chief victims if ever Magistrate Murphy's dictum becomes the law.

As no state in the Union obeyed his order that the automobile laws be changed to conform with those of New Jersey, it would seem that the entertaining Commissioner of Motor Vehicles of the latter state could save time and postage stamps by "blacklisting" all of the other states at one swoop, instead of doing the job piecemeal. Such a list would be so truly formidable that it might frighten the rest of the world

August 12, Detroit, Mich.—Track race-meet, State fair grounds.

August 12, Philadelphia, Pa.—Quaker City Motor Club's annual reliability trial for pleasure cars.

Aug. 12, Worcester, Mass.—Worcester Automobile Club's sixth annual hill climb on Dead Horse Hill.

August 12, Baltimore, Md.—Racemeet under management of E. A. Moross.

Aug. 17, St. Louis, Mo.—Reliability contest under auspices Missouri Automobile Association.

August 25-26, Elgin, Ill.—Chicago Motor Club's national stock chassis road races.

Sept. 1, Oklahoma, Okla.—Reliability contest under auspices of the Daily Oklahoman.

Sept. 2-4, Brighton Beach, N. Y.—Racemeet under management of E. A. Moross.

Sept. 4, Denver, Col.—Denver Motor Club's racemeet on motordrome.

September 4-5, Brighton Beach, N. Y.—Twenty-four hours race under management E. A. Moross.

Sept. 7-8, Philadelphia, Pa.—Philadelphia Auto Trade Association's racemeet.

Sept. 7-9, Hamline Track, Minn.—Minnesota State Automobile Association's racemeet.

Sept. 7-10, Buffalo, N. Y.—Reliability contest under auspices Automobile Club of Buffalo.

Sept. 9, Bologna, Italy—International road race for the Italian Grand Prix over the Bologna circuit.

Sept. 12-13, Grand Rapids, Mich.—Michigan State Automobile Association's racemeet.

Sept. 15, Knoxville, Tenn.—Track meet, Appalachian Exposition.

Sept. 16, Syracuse, N. Y.—National Circuit track meet, State Fair grounds.

Sept. 18-20, Chicago, Ill.—Reliability contest for motor trucks, under auspices of Chicago Motor Club.

Sept. 23, Lowell, Mass.—Road races under auspices of Lowell Automobile Club.

Sept. 23, Detroit, Mich.—State Automobile Association's racemeet.

Sept. 30-Oct. 7, Sydney, N. S. W.—Inter-

national automobile exposition under auspices of Royal Agricultural Society.

Oct. 2-7, St. Louis, Mo.—St. Louis Automobile Manufacturers and Dealers' Association's open air show.

Oct. 3-7, Danbury, Conn.—Track meet under auspices Danbury Agricultural Society.

October 7, Philadelphia, Pa.—Quaker City Motor Club's 200 miles race at Fairmount Park.

Oct. 9-13, Chicago, Ill.—1,000 mile reliability contest under auspices Chicago Motor Club.

Oct. 14, Santa Monica, Cal.—Santa Monica road races under auspices of Santa Monica Motor Car Dealers' Association.

Oct. 12-22, Berlin, Germany.—International automobile show in Exhibition Hall, Zoological Garden.

Oct. 13-14, Atlanta, Ga.—Racemeet under management H. C. George.

Oct. 16-18, Harrisburg, Pa.—Reliability contest under auspices Motor Club of Harrisburg.

Nov. 1, Waco, Texas—Racemeet under auspices Waco Automobile Club.

Nov. 2-4, Philadelphia, Pa.—Reliability contest under auspices Quaker City Motor Club.

Nov. 4-6, Los Angeles, Cal.—The Phoenix road races under auspices Maricopa Automobile Club.

Nov. 9-12, San Antonio, Texas—Racemeet under auspices San Antonio Automobile Club.

Nov. 9, Phoenix, Ariz.—Track races under auspices Maricopa Automobile Club.

Nov. 27, Savannah, Ga.—Vanderbilt Cup races under auspices Savannah Automobile Club.

Nov. 29, Savannah, Ga.—Grand Prize road race under auspices Savannah Automobile Club.

Nov. 30, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

Dec. 25-26, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

Jan. 6-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden.

Jan. 10-17, New York City—National Association of Automobile Manufacturers' 12th annual show in Grand Central Palace.

Jan. 27-Feb. 10, Chicago, Ill.—National Association of Automobile Manufacturers' 11th annual national show in Coliseum and First Regiment Armory.

into abject submission and even compel extra sessions of the various legislatures! The fact that Connecticut, Illinois and a few other states grant free travel to New Jerseymen, although New Jersey charges their citizens an "admission fee" of \$1, is

no reason why they should be excepted. Their laws are inconsistent with those of New Jersey and they must be altered. New Jersey's commissioner is too consistent to permit one-sided reciprocity to exist in any form or in any direction!

ZENGLE BIGGEST NAME OF THE BEACH

National Crack Overshadows All Others on Galveston Sands—Finishes First in Seven of Twelve Events.

Over the Galveston racemeet of 1911, which was held on Thursday, Friday and Saturday last, 3d, 4th and 5th inst., on Denver beach, which is close by that Texas city, the name of Len Zengle, National pilot, looms large. Zengle, who alternately drove a National stock car and a special racing machine of the same make, cleaned up just seven of the twelve events carded during the three days, which, as in the two previous years, formed part—a very considerable part be it added—of Galveston's "17 days of joy," otherwise known as the annual cotton carnival. As those seven firsts were won in the only seven events in which the Zengle-National aggregation was entered it is apparent that the "team," to use a theatrical phrase, simply "hogged the limelight."

As was the case at last year's meet the biggest crowd of the three days assembled for the inauguration of the sport, but though the big grandstand was packed on Thursday, on Friday more than a few seats were available and by Saturday the crowd was still further thinned out. Due to the excellent policing, the meet was "accidentless"—a large force of special deputies was augmented by the presence of part of the Texas militia—and not even the multitude of dogs which last year scurried across the sands were able to pass the "firing line," marked for a good part of the course by a very new and very substantial wooden fence.

Following the curtain raiser, a 10-mile race for stock chassis cars of from 161 to 230 cubic inches piston displacement, which was won handily by Albert Hoffman in a Ford, the only contender being Mortimer Roberts, who, as usual, piloted an Abbott-Detroit, Zengle started his winning streak by walking away with first prize money in a 20-mile event for stock chassis cars in the 301-450-inch class with a minimum weight of 1,800 pounds. This race, like the other, was a match event; though three drivers originally signified their intention of starting, Captain J. W. Munn (National), who was the popular idol last year, withdrew at the last minute, leaving Zengle and George Baker (Pope-Hartford) to fight it out alone. It was not much of a fight, however, as Zengle took the lead at the gun and never was headed. His time was 19:20, and Baker finished 1 minute and 13 seconds later.

George De Witt (Cadillac) accounted for a 10-mile race for stock chassis cars in the 231-300-inch class, in which there were only two starters, and though James Geary, who had the mount on a Marion, fought

hard and at one time lead the winner he was unable to maintain the pace. De Witt's time was 11:19. The piece de resistance of the day, a 50-mile non-stock, free-for-all, was reserved to the last, and it brought out the largest field, 11 cars lining up for the start. Roberts in his Abbott-Detroit took the lead at the start, but immediately afterward Zengle flashed to the front and never was headed. Thereafter the only really exciting part of the race was the scrap between McHugh (National) and Endicott (Inter-State) for second place, all the other cars being strung out far behind the leaders. Eventually these two drivers finished second and third, respectively, behind Zengle, whose time for the 50 miles was 45:15.

The second day was practically a repetition of the first, with Zengle to the front in three out of the five events carded. In each case he won apparently with ease, his first victory coming in a 20-mile stock chassis race for cars of from 451-500 cubic inches piston displacement. Thereafter he won in rapid succession the mile time trials, in which he lowered his own record of 40 $\frac{3}{4}$ seconds, made last year with a Chadwick, to 37 $\frac{1}{4}$ seconds, and a special 50 miles free-for-all, in which he was the only one of a field of eight to finish. A 50 miles owner's race brought out only one starter who was eligible, Bud Hamilton (National), and he won in a walkover. Hoffman in his Ford repeated his victory over Roberts in a 20-mile stock chassis race for cars in the 161-230-inch class, and the curtain was rung down on the second day with a five-mile race for electric cars, which was won by James Collinas in a Columbus electric, with Cortes Pauls, Jr., in a Baccok, second. Another Columbus, driven by E. Wallingford, dropped out of the race after running about two miles. The smooth, noiseless running of the electrics was in marked contrast to the smoking and snorting gasoline propelled cars.

Zengle's batting average on the last day was even better than it was on the previous day. In addition to carrying off the honors in a 10-mile race for cars of from 301 to 450 cubic inches piston displacement, he also won the longest race of the meet—it was at 150 miles and was a non-stock free-for-all—and inasmuch as there is no American mark for the distance, straight-away, regardless of class, it is not unlikely that his time of 2:06:06 will stand as a record. Nine other starters lined up for the gun in the long race, but Zengle soon outdistanced them all; his chances of winning never were in danger. Barring William Rader (National), who was second, and Harry Endicott (Inter-State), who was third, Hoffman in a Ford was the only other contestant to finish. His time was 3:01:30.

In the other 10-mile race which was run off on the last day and which was a stock chassis event for cars in the 231-300-inch class, George De Witt, who had the mount

on a Cadillac, very easily took the measure of Van Curtis (Marion), winning handily in 11:09 $\frac{3}{4}$. The summary:

Thursday, August 3d.

Ten miles, stock chassis, 161-230 cubic inches, 1,200 pounds minimum weight—Won by Albert Hoffman, Ford; second, Mortimer Roberts, Abbott-Detroit. Time, 11:24 $\frac{3}{4}$.

Twenty miles, stock chassis, 301-450 cubic inches, 1,800 pounds minimum weight—Won by Len Zengle, National; second, Harry Baker, Pope-Hartford. Time, 19:20.

Ten miles, stock chassis, 231-300 cubic inches, 1,500 pounds minimum weight—Won by George De Witt, Cadillac; second, James Geary, Marion. Time, 11:19.

Fifty miles, non-stock, free-for-all—Won by Len Zengle, National; second, Neal McHugh, National; third, Harry Endicott, Inter-State. Time, 45:15.

Friday August 4th.

Twenty miles, stock chassis, 451-600 cubic inches, 2,100 pounds minimum weight—Won by Len Zengle, National; second, Harry Baker, Pope-Hartford. Time, 23:45.

Twenty miles, stock chassis, 161-230 cubic inches, 1,200 pounds minimum weight—Won by Albert Hoffman, Ford; second, Mortimer Roberts, Abbott-Detroit. Time, 23:22.

One mile time trials, class E—Len Zengle, National Special. Time, :37 $\frac{1}{4}$ seconds. Len Zengle, National stock car. Time, :41 seconds. Harry Endicott, Inter-State. Time :42 $\frac{3}{4}$ seconds.

Fifty miles, class E, owner's race—Walkover for Bud Hamilton, National. No time taken.

Fifty miles special, free-for-all—Won by Len Zengle, National. Time, 40:39 $\frac{1}{4}$. No others finished.

Five miles for electric cars—Won by James Collinas, Columbus; second, Cortes Pauls, Jr., Baccok. Time, 13:21.

Saturday, August 5th.

One hundred and fifty miles, non-stock, free-for-all—Won by Len Zengle, National; second, William Rader, National; third, Harry Endicott, Inter-State. Time, 2:06:06.

Ten miles, stock chassis, 231-300 cubic inches, 1,200 pounds minimum weight—Won by George De Witt, Cadillac; second, Van Curtis, Marion. Time, 11:09 $\frac{3}{4}$.

Ten miles, stock chassis, 301-450 cubic inches, 1,800 pounds minimum weight—Won by Len Zengle, National; second, Harry Baker, Pope-Hartford. Time, 10:45 $\frac{3}{4}$.

Potter to Direct Shelby Motorists.

Motorists of Shelby County (Iowa) have organized the Shelby County Automobile Association, with headquarters at Harlem. The officers are: President, L. F. Potter; vice-president, C. A. Reynolds; secretary, Fred Hulsebus; treasurer, W. L. Paup; directors, I. E. Hoover, Dr. E. A. Moore and Dr. F. E. Brazie.

PREMIER TOURISTS REACH PACIFIC

**Most Notable Journey of Private Owners
Is Completed Ahead of Schedule—
Experiences Many and Varied.**

Twenty-four Morgan & Wright "Nobby" tread tires are due to be dipped into the water of the Pacific at Ocean City, near Los Angeles, Cal., to-day (Thursday), thus marking the completion of the transcontinental journey of the Premier touring party. The tires are on the front wheels of twelve Premier automobiles which carried thirty men, eight women and two children from the Atlantic seaboard across six

gees two days ahead of time. The cities visited and the route followed included Philadelphia and Harrisburg, Pa.; Baltimore, Md.; Washington, D. C.; Cumberland, Md.; Uniontown, Pa.; Zanesville, O.; Indianapolis, Ind.; Chicago, Ill.; Davenport and Des Moines, Ia.; Omaha, Neb.; Denver, Col.; Cheyenne, Rawlins, Rock Springs, and Kemmerer, Wyo.; Salt Lake City, Utah; Reno, Nev.; Auburn, San Jose, San Francisco, Stockton, Fresno and Los Angeles, Cal.

The more picturesque part of the trip did not begin until Omaha was reached, as up to that time hotel accommodations were good. Beyond that point, however, the cities where such large parties can be well taken care of being far apart, the tourists

but from the latter place until the completion of the journey they were able to obtain good hotel accommodations. Through Southern California, however, the beautiful weather of the enticing nights caused the tents to be used, as the "schooner" remained with the motorists until Los Angeles was reached.

Two expert photographers, one of whom operated a moving picture camera, accompanied the tourists and supplied hundreds of souvenir post cards of the journey, in which they were the central figures and which were sent broadcast to their friends all over the country.

High Price for a Spurious Tag.

There's many a slip between cup and lip, as Jacob Blaustein has learned to his sorrow. Blaustein drives an automobile for his uncle in New York, and one day last week he visited New Jersey, but instead of purchasing a yearly license he secured through a man in Hoboken an eight-day tourist tag, which is not allowed New Yorkers. However, everything would have worked alright if Blaustein had not ditched his car near Ridgewood, N. J. Then the tag transaction came out and he was haled to court and fined \$100 for driving without a license and held in \$500 bail for the grand jury for displaying a spurious tag.

Abbott "Bulldog" Passes 30,000th Mile.

The Abbott-Detroit "Bulldog," which as aptly might be styled the Abbott-Detroit Mile Hunter, which, under the direction of C. G. Percival, is piling up a mileage record, completed its first year's travel when it reached Barbara, Cal., on the 1st inst., with a record of 30,424 miles to its credit. During the 12 months it visited 44 States, traveled from the Great Lakes to the Gulf of Mexico—and into Mexico—and reached from ocean to ocean. It now is en route up the Pacific Coast to British Columbia and Alaska.

When Owner May Become a Chauffeur.

Replying to a letter from an automobile owner who desired to take acquaintances motoring for a small consideration, Cornelius Roach, secretary of the state of Missouri, rules that, under the new law, even though a man owns a car, if he uses it in rental service and drives it himself, he must have a chauffeur's license. Under the new Missouri law, any man who drives a car for pay is a chauffeur.

No Gasolene in Roanoke on Sundays.

Roanoke, Va., has "got religion," and has become so full of Sunday observance laws, that all of the garages and other automobile establishments in the city now are closed so tightly on Sundays that not even gasolene is purchasable. One of the local papers cites this reform as additional evidence of Roanoke's "remarkable progress" and "broad-gauged citizenship."

PREMIER OCEAN-TO-OCEAN TOURISTS AT A HALF-WAY POINT

mountain ranges and a couple of deserts to the shores of the Pacific. The motorists left Atlantic City, N. J., Monday, June 26, after going through the formality of backing the twenty-four Continental tires which encircled the rear wheels of the automobiles, into the waters of the Atlantic. The front tires were reserved for wetting in the Pacific.

As stated in the Motor World of June 29, the party is made up entirely of owners driving their own cars. The only professional chauffeur in attendance drove the pathfinding car, which was not officially included in the tour. Because of this fact the tour stands as one of the most notable ever undertaken and demonstrates that there are no insurmountable difficulties in ocean-to-ocean travel in touring cars driven by their owners, as, with the exception of three broken springs, no mechanical difficulties were encountered. The schedule allowed thirty-six days for travel to cover the 4,500 odd miles, and eleven days for sightseeing. The tourists, however, gained on their schedule and will reach Los An-

provided a camping outfit and established a tented village, as did the early pioneers along Western trails. For this purpose a car was fitted out as a "prairie schooner," but instead of crude wood fires for the culinary department, modern gasolene stoves were used. This modernizing of ancient methods was still further exemplified by the use of the Remy electric lights and Prest-O-Lite tanks for illumination, instead of candles.

On the Medicine Bow range of the Rockies, in Colorado, the motorists were caught in a cloud burst, which made the roads impassable for a time. The eight women of the party, including Countess De Calatrava, with the children, slept in a barn, while the men made the best of conditions in the army tents. From there to Rocky Springs, Wyo., was a difficult journey, as the route was over the Continental divide, where the elevation is 7,500 feet, and through Tide Siding, Wyo., where the altitude is over 8,000 feet.

Between Salt Lake City, Utah, and Reno, Nev., the tourists camped out every night,

MOTOR TRUCK CROSSES CONTINENT

Saurer Vehicle Completes Long Journey in Two Instalments—Soul-Trying Undertaking That Occupied Five Months.

What is undoubtedly the most extensive and most strenuous demonstration of a motor truck that ever has been accomplished was completed Wednesday, 2d inst., when a five-ton Saurer truck rolled into New York, thereby completing a 5,000-mile journey from the Pacific to the Atlantic coast. This "Pioneer Freighter," as it was dubbed by its owners, was loaded, among other things, with camp equipment,

days when only three miles were covered and when a dozen bridges had to be braced in order to permit progress. After two weeks spent in Los Angeles the truck continued to San Francisco, at which point A. L. Westgard, who had directed its operations, retired.

The journey from ocean to ocean was not continuous, as on June 9 the truck was shipped by rail from San Francisco to Pueblo, Col., where the road journey eastward was taken up on June 15. During the 779 miles to Kansas City, Mo., A. C. Thompson and George McLean, who "spelled" one another at the wheel and to whose courage and endurance under trying ordeals much of the success is due, performed some strenuous work. They got

SAURER CROSS-CONTINENT TRUCK AT ITS JOURNEY'S END

timber for shoring up bridges and making mud holes passable, and a powerful winch, which is operated by the engine of the car and which proved of great assistance in hauling the truck out of bad spots. When it reached New York the truck looked the worse for wear, but it had no trouble in "keeping step" with an escort of 15 trucks which met it on the outskirts and accompanied it into the city. Its appearance only mildly suggested the many times it had been hub deep in sand, or became mired in two or three feet of slimy mud, which covered many of the so-called roads of the Middle West.

The big truck left Denver, Col., March 1, headed for San Francisco, Cal., via the Southern trail, or "Trail of the Sunset," which was followed by the pioneers of '49, and after 69 days of soul-trying travel it reached Los Angeles, Cal. But half the time was spent in actually moving, as the "going" was almost beyond description. The winter rain and snow made it almost impossible for the truck to move, and there were

but seven hours sleep and spent eight hours at Hutchinson, Kan., in rebuilding a bridge wrecked by the truck. From Kansas City the route led through Chicago, Toledo, Detroit, Buffalo and thence to New York.

What Constitutes "Provoke" in Indiana.

Charges of "provoke"—whatever that may be in legal parlance—have been filed by William E. Springer, president of an Elizabethtown (Ind.) bank, against Thomas Groub, a wholesale grocer from the neighboring town of Seymour. Springer claims that Groub was running his automobile while in an intoxicated condition, and that the grocer zigzagged across the road in front of his (the banker's) car; that the accused furthermore persisted in opening his muffler, thereby stirring up the dust and throwing it over the occupants of complainant's machine; that this performance was continued for about five miles and he got tired of it—and as a result he intends to show the presuming grocer what it means to "provoke" a banker!

30 TRUCKS START IN 10 DAYS TEST

Chicago-Detroit-Chicago Affair Attracts Big Field—Eight Contestants Suffer Penalizations on First Day.

Scheduled to travel at an average rate of 75.8 miles a day for the ensuing eight days, 30 motor trucks, loaded to their rated capacities, started on Tuesday, 8th inst., from Chicago on the first leg of Hearst's Chicago American's second reliability run for commercial vehicles; before they return to Chicago they will have covered close to 700 miles, most of it between that city and Detroit, Mich., and return, which is the route that will be followed. Though the Chicago American nominally has the affair "under its wing," the Chicago Automobile Club and the Wolverine Automobile Club of Detroit each have more or less to do with it, the former looking after the technical details and supplying most of the officials and the latter keeping a watchful eye on matters in its home city.

The run is designated a Grade 3 event, which, according to the recently adopted rules of the American Automobile Association governing commercial vehicle contests, means that it is a "a demonstration in which time penalties are imposed and a record is taken of the gasoline, oil or electric current consumed and the cost of same used to determine the fuel efficiency of the vehicle." Following is the complete list of starters:

Division 2K, 501-1,000 Pounds Capacity.	
No. Truck.	Entrant.
9—Cass.....	Poss Motor Co.
24—Lincoln.....	Lincoln Motor Car Works
37—Van Dyke.....	Van Dyke Motor Car Co.
Division 3K, 1,001-1,500 Pounds Capacity.	
5—Buffalo.....	Bowling Green M. C. Co.
10—Buick.....	Buick Motor Co.
11—Buick.....	Buick Motor Co.
18—International.....	Inter. Harv. Co.
19—International.....	Inter. Harv. Co.
27—Kirkworth.....	Kirkworth Wagon Co.
31—Little Giant.....	Chicago Pneu. Tool Co.
33—Chase.....	Chase Motor Wagon Co.
Division 4K, 1,501-2,000 Pounds Capacity.	
1—Gramm.....	Gramm Motor Co.
6—Hewitt.....	Hewitt Motor Car Co.
20—Luth Juergens.....	L. Juergens M. C. Co.
23—Le Moon.....	Nelson Le Moon
30—Owosso.....	Owosso Motor Co.
38—Clark.....	Clark Delivery Car Co.
39—Ideal.....	Ideal Auto Co.
40—Chase.....	Chase Motor Wagon Co.
Division 5K, 2,001-3,000 Pounds Capacity.	
32—Federal.....	Federal Motor Car Co.
36—Stevenson.....	Stevenson Motor Truck Co.
Division 7K, 4,001-5,000 Pounds Capacity.	
2—Gramm.....	Gramm Motor Truck Co.
16—Kelly.....	Kelly Motor Car Co.
29—Mais.....	Mais Motor Truck Co.
Division 8K, 5,001-7,000 Pounds Capacity.	
3—Gramm.....	Gramm Motor Truck Co.
8—Grabowsky.....	Grabowsky P. W. Co.
14—Dayton.....	Dayton Auto Truck Co.
17—Kelly.....	Kelly Motor Truck Co.

Division 9K, 7,001-10,000 Pounds Capacity.
 4—Gramm.....Gramm Motor Truck Co.
 15—Speedwell....Speedwell Motor Car Co.

All of the trucks reached South Bend, Ind., on Tuesday evening, as scheduled, and though all started yesterday morning (Wednesday) on the 77.3 miles run to Fort Wayne, where the next night control was located, the 95 miles trip of the previous day had left its mark, and eight of them carried penalties varying from 4 to 110 points. The Cass truck No. 9 drew the largest number of demerits, getting 110, and the smallest number, 4, was chalked up against No. 40 Chase. Of the six others one of the Gramms got 8 debits, one of the Kellys also got 8, the Ideal 10, the Kirkworth 20 and Vandyke 39.

To-day (Thursday) the trail leads from Wayne to Lima, O., a distance of 63 miles, and on Friday the 83 miles between Lima and Toledo, via Beaver Dam, Findlay and Bowling Green will be essayed. Detroit will be reached on the fifth day, the 59 miles between that city and Toledo being covered on Saturday, 12th inst. From Detroit the trail leads to Jackson, 73.9 miles, and to Kalamazoo, 65.9 miles, Monday and Tuesday, respectively, being scheduled as the days for these runs, the whole of Sunday being spent in Detroit. Sixty-eight miles on Wednesday, 16th inst., and 96 on the following day will take the party to South Bend and to Chicago respectively, where the run will be terminated on Thursday, 17th inst.

California Re-echoes New York Ruling.

In the state of California no motorist will have to bear witness against himself. This is the opinion of Judge B. F. Bledsoe, of the San Bernardino County Superior Court. The decision was rendered in the case of Fred Hendee, George Smith and Jesus Amarias, of San Bernardino, Cal., who failed to stop their car and report the accident, after having run down and killed F. W. Pattee, a citizen of the California town. The legislature of California recently enacted a statute similar to the Callan law in New York, which makes it a felony for failure on the part of an automobilist not to stop after an accident and give his name and address to the police. The Bledsoe decision is in line with the ruling of the New York courts in the Rosenheimer case, but goes even further, for the California court says the law is unconstitutional, as it applies only to motor vehicles.

Pontiac Organizes Automobile Club.

Twenty-seven motorists of Pontiac, Mich., have organized the Pontiac Automobile Club, which will affiliate with the Michigan State Automobile Association. President E. A. Skae, of the state organization, was present at the first meeting. The officers are: President, S. S. Crohn; vice-president, D. I. Oliver; secretary-treasurer, Cramer Smith.

BURMAN REGAINS "MEAL TICKET"

Takes it Away from Knipper at Scranton Racemeet—Local Driver, However, Surprises the Moross Troupe.

Scranton, which is in the coal region of Pennsylvania, had a racemeet on Monday afternoon, 7th inst., and the particular spot in that mining town where the racing was done was an antiquated half-mile dirt horse track styled the Minooka Driving Park. Originally the meet was scheduled for the previous Saturday, but the track, which even on Monday was in anything but perfect condition, was unapproachable on the earlier date because of rain. Barring the fact that Knipper let the Remy "meal ticket" slip through his fingers, though no outsider was permitted to even get a good look at it, Burman winning it back after letting his team mate enjoy its privileges for just one week, little of a sensational nature developed. Not even a single record was broken, notwithstanding the fact that the E. A. Moross aggregation has a sort of "Midas touch" as far as records go. But then, the American Automobile Association does not recognize "records" which are made on tracks smaller than one mile in circumference, which probably accounts for the absence of this feature of the program.

Principal interest centered in a three miles handicap race, in which Burman in one of the Moross Benz cars was on scratch with three other cars between him and William Williams, whose "baby" Buick was on the long mark. Knipper was very much in it, too, at the wheel of a Lozier, and the appearance of a 120 horsepower Hotchkiss, with Charles Kilpatrick up, added spice to the contest. Williams, however, proved the real surprise party. After a hard fight which lasted five laps Burman passed all the other cars except Williams's Buick. Williams's lead was too great by the narrow margin of $\frac{1}{2}$ of a second, which was the amount of time between him and Burman at the finish. Williams also accounted for a two miles event for cars of less than 300 cubic inches piston displacement. The remainder of the program was made up of mile and half-mile exhibitions, a three laps novelty race, which went to C. H. Moulthrop in an Ohio car, and the race for the Remy Brassard. The summary:

Two miles, class C, 300 cubic inches and under—Won by William Williams, Buick; second, Ed. Richmond, Ford; third, C. H. Moulthrop, Penn "30." Time, 2:45 $\frac{3}{4}$.

One-half mile time trials—Robert Burman (Benz), 34 $\frac{3}{4}$ seconds; Wm. Knipper (Mercedes), 37 $\frac{3}{4}$ seconds.

Two miles handicap, match—Won by Charles Kilpatrick, Hotchkiss (scratch);

second, W. Meenan, National (15 seconds). Time, 2:43 $\frac{3}{4}$.

One and one-half miles novelty race—Won by C. H. Moulthrop, Ohio; second, Ed. Richmond, Ford. Time, 3 minutes.

One mile time trials—Robert Burman (Benz), 1:09 $\frac{3}{4}$; Wm. Knipper (Mercedes), 1:13 $\frac{3}{4}$.

Three miles handicap, free-for-all—Won by William Williams, Buick (60 seconds); second, Robert Burman, Benz (scratch); third, C. H. Moulthrop, Penn "30" (50 seconds). Time, 3:48 $\frac{3}{4}$.

Two miles, free-for-all, for Remy Grand Brassard, best two out of three heats—Won by Robert Burman (Benz) in two straight heats; Wm. Knipper (Mercedes) and C. H. Moulthrop (Hotchkiss), second and third, respectively, in both. Time: first heat, 2:36 $\frac{3}{4}$; second heat, 2:38 $\frac{3}{4}$.

Blames Motor Car for Political Defeat.

After blaming the automobile for diseases, and bank failures, and ruining the silk hat industry and 1,001 other "crimes," it would seem as if the record of sins attributed to the motor car had reached the limit, but last week a new one was added to the list. It is nothing less than the loss of an important political nomination, due, it is claimed, to the inability of the owner of the car to use it in canvassing the countryside.

Corrie C. Coburn, of Grand Haven, Mich., is the political sufferer who thus has added to the humor of the nation, by filing suit for \$1,000 against the Muskegon Auto Co., of Muskegon, Mich., for depriving him of the use of his motor car during a fight for the nomination for district attorney, which action he claims resulted in his defeat. In answering the charge, the garage company merely states that the would-be district attorney owed it \$50 for supplies, etc., and that it had no intention of letting him use the car until this debt was paid. While they were wrangling over the \$50, the nominating proceedings went merrily on, and Mr. Coburn finished the race for office second best.

Port Jefferson Encourages the Amateurs.

Having obtained its first taste last year, Port Jefferson, L. I., will repeat its hill climbing contest on September 9th, under the auspices of the Port Jefferson Automobile Association. Sixteen events have been carded, seven for professional drivers, the remainder for amateurs; four of the latter will be restricted to residents of the surrounding country. The free-for-all will carry with it the Ardencraig trophy and cash prizes of \$150, \$75 and \$50. For the other "pro" events purses of \$50 and \$25 are offered, and \$50 will be added for the breaking of the record for the hill, which now is held by Ralph DePalma. The grade is about 2,000 feet long and though it is quite steep in places the average rise very closely approximates 10 per cent.

NEW YORK'S SPEED LIMIT IN DOUBT

City Magistrates Disagree and Punishment Varies With the Court—Law's Language Gives Rise to Trouble.

With one New York City magistrate holding that the speed limit within the city is fixed by the Callan law, that is to say, at thirty miles an hour, and with two other magistrates deciding that the city ordinance passed in 1896 and limiting the speed of all vehicles to eight miles an hour is valid and not superseded by the State automobile law, the speed law tangle of New York City has grown worse than ever. As a result the police do not know what stand to take, but it is expected that some form of agreement will be reached at the City Magistrates' Board meeting this week.

Magistrate Daniel F. Murphy, sitting in the Yorkville court on Monday, the 7th inst., discharged a prisoner charged with speeding at the rate of 27 miles an hour. The policeman making the arrest admitted that the avenue was practically free of traffic at the time, and the magistrate thereupon cited the Callan law as to what constitutes reckless driving. He went further and rebuked the officer for arresting the motorist, practically ordering him not to bring such offenders again to his court. Before nightfall the decision had become known all over the town and a noticeable increase in the average speed of automobiles took place.

The very next morning, however, and partly as a result of following Magistrate Murphy's decision, two offenders, who had printed copies of it in their pockets, were caught by pursuing motorcycle policemen and arraigned before Magistrates O'Connor and Freschi, respectively. The former, sitting in the Harlem Court, smiled when shown his brother magistrate's decision of the preceding day and ordered the court stenographer to take notes of the proceedings. He then acted the part of the defendant's counsel, taking exception to the charge, citing the Callan law, etc., and finally asking the court for a dismissal of the charge. He then returned to his magistrate's duties and accepted his own exception, but fined the motorist \$5.

Simultaneously Magistrate Freschi, in the West Side Court, decided that the Callan law does not apply to New York City, and that the old ordinance of 1896 holds good. When he was shown the contrary decision of Magistrate Murphy he maintained his own view, but paroled the accused motorist in the custody of the latter's lawyer until he could prepare a written memorandum as to whether the ordinance is or is not enforceable.

The chief bone of contention appears to be the clause exempting cities of the first

class from the speed provisions of the Callan law. This clause reads: " * * * and provided further that nothing in this article contained shall impair the validity or effect of any ordinances regulating the speed of motor vehicles * * * heretofore or hereafter made, adopted or prescribed pursuant to law in any city of the first class * * * ." The wording of the law appears to be clear enough in this paragraph, but in the following sentence, separated only by a semi-colon from the "first-class clause" it is provided that "each city or village shall cause sign posts to be erected at the highways entering such city or village * * *"; the original draft of the law read "such cities, etc. * * *" referring distinctly to cities of the third class and villages. The substitution of the word "each" for "such" has been held to include New York among the cities required to erect sign posts in order to make its speed ordinance effective and legal. One of the best-know corporation lawyers of the city held this view recently and succeeded in obtaining a discharge from a Brooklyn court on account of this clause.

New Jersey Now Bars Bay Staters.

Because the Massachusetts legislature adjourned without obeying his "command" to change its law to conform with that of New Jersey, J. B. R. Smith, the employe of the latter state, who serves as its commissioner of motor vehicles, has brought the Frelinghuysen "exclusion act" to bear and closed the roads of New Jersey to all Massachusetts motorists who have not paid for a full year's registration. Massachusetts is another of the many states in which New Jerseymen may travel without charge whenever their legislature repeals its demand for \$1 for the privilege of entering the state. New York, Pennsylvania and Delaware already are on Smith's "black-list."

Bearing on the situation created by the law and the Commissioner, Mayor Appleby, of Asbury Park, has called a conference of the clubs and other interested, which will occur on Saturday, 19th inst., at the New Monmouth Hotel, Spring Lake.

Adding to Expense of Motor Trucks.

Apparently for no better reason than that they look like "easy money," Mayor Shanks, of Indianapolis, is seeking to boost the city's revenue by raising the license fee for motor trucks to \$10 per year. At present they pay \$3.

STATISTICS THAT SHOW PROGRESS

Massachusetts Supplies Figures Affording Comparisons—How Dealers and Owner-Drivers Have Increased.

According to figures issued by the Massachusetts Highway Commission, which give the first satisfying comparison of the various features of automobile registration, made possible by the annual registration laws, there were granted during the first eight months of the fiscal year 1911 (December 1, 1910, to August 1, 1911), 34,340 certificates of registration of automobiles, or almost 3,000 more than during the whole fiscal year of 1910. For the corresponding eight months of 1910 the number of automobile certificates issued was 27,487, a gain this year to date of 7,000 certificates. Manufacturers and dealers applied for 816 certificates, as against 649 during the whole fiscal year of 1910.

By far more significant, however, than the mere increase of registrations is the remarkable rise of the private-owner-driver, as against the professional chauffeur. Up to August 1, of this year, licenses to operate motor vehicles had been granted to 7,768 private owners, with 22,491 renewals of old licenses, and 2,743 new licenses to chauffeurs, with 8,873 renewals. Thus it will be noted that the total number of new licenses for private owners and renewals of old licenses during the first eight months of 1911 is 30,259, as compared with 28,611 for the entire fiscal year of 1910, while the total of the chauffeurs' licenses, new and renewed, this year is 10,252, as compared with 12,648 in 1910. In other words, the number of licenses to private operators this year already has increased almost 2,000 over the last fiscal year, while the number of chauffeurs' licenses has decreased more than that figure.

Beginning with the current year licenses for commercial vehicles and tourists will be handled separately, the former carrying the letter "B" (business) followed by the registration number, the latter provided with the prefix "X." During the month of July alone 520 tourists' certificates were issued, which compared with the 742 issued in July, August and September of 1910, constitutes another record.

The following table gives the figures for the last four fiscal years:

	1908.	1909.	1910.	1911. up to Aug. 1.
Certificates of registration:				
Automobiles	18,066	23,971	31,360	34,340
Motorcycles	1,922	2,394	3,370	3,165
Manufacturers or dealers.....	381	491	649	816
Licenses to operate:				
Private operators	5,865	8,336	9,450	7,768
Private operator renewals.....			19,161	22,491
Chauffeurs	2,343	3,289	3,775	2,743
Chauffeur renewals	4,962	6,626	8,873	7,509
Examinations	1,215	4,630	5,424	4,009

* No distinction then made between private operators and chauffeurs in renewals.

OVER-PRODUCTION CHIEF DANGER

Hugh Chalmers's Views of Future of the Industry—Percentages That Must Be Reckoned With.

While issuing a solemn warning against the dangers of over-production and at the same time expressing the conviction that the future of the automobile industry lies in the thoroughly standardized medium priced car, Hugh Chalmers, of Detroit, offers the prediction that 1912 will be a most prosperous year.

"Those manufacturers who build cars of high dollar-for-dollar value and at the same time refrain from over-production, have nothing to fear from the future," is his way of summarizing the idea.

"With a great many of the standard cars for 1912 already announced, and with a new manufacturing season well under way, I have no hesitancy in predicting that 1912 will be a most prosperous year for the automobile industry," he declares in an article appearing in the *Scientific American*. "I do not say that as a mere matter of form," he continues, "but because I really believe it. Every large manufacturer of motor cars is vitally interested in the prospects for business. I know of many men in the industry who, after careful investigation of conditions, have arrived at the same opinion as myself.

"In my opinion success in the automobile industry depends upon the solution of a manufacturing problem. The days of rapid fire manufacturing and selling, of pyrotechnics and hail-fellow-well-met methods are past. We all know that water will reach its level. It cannot flow up hill and it is bound to flow down as soon as some of it is drained away.

"The water has been drained out of the automobile industry.

"I believe there is a tremendous market both in the United States and abroad for American-made automobiles. I consider this market will last not only this year and next year, but for many years to come. Yet it is possible in any one season to flood this market. Over-production is the greatest danger to the automobile industry; or, at least, to those manufacturers who do not immediately realize that building and selling automobiles is a manufacturing proposition just like the building and selling of any other commodity.

"There is a great market, for instance, for adding machines. Yet it would be ridiculous to think that manufacturers could build two or three hundred thousand adding machines every year and not flood the market.

"I think some manufacturers of automobiles have not yet come to a full realization of the fact that they can build too many cars. Those manufacturers, I surmise, are

apt to find 1912 a very hard season before they are through with it. There are some who may find themselves in serious difficulties in the next couple of years unless they plan more conservative operations than they have attempted in the past few years.

"Every manufacturer must realize that for every thousand of population there is only a certain percentage of men of enough means to buy motor cars. The automobile manufacturer must consider his market. The percentage of people of means in every community is almost as exact as the mortality rates. Only trouble can result from trying to go beyond the fact.

"In my opinion the future of the automobile industry lies in the thoroughly standardized medium priced cars. The higher priced cars have a much more limited market than the medium priced cars. They cannot be built in as large quantities, and yet, quite as elaborate manufacturing facilities are required for their production. On the other hand, there are on the market at this time a number of medium priced cars which will give to the average buyer all the service he could purchase at any price. For this class the future business possibilities seem to me to be practically unlimited.

"I believe, too, that the market for the American medium priced car will extend to all of the automobile centers of Europe. There can be no question but that the American manufacturer is better equipped to build a good medium priced car than his European competitor on account of both his standardization method and quantity production of such machines.

"But the medium priced car which is to be a continued success must be well built, well finished and well equipped. It must be able to compete with high priced cars, without discredit to its owner. To this end all of the leading manufacturers are working.

"In this matter of greater automobile values one again has purely a manufacturing problem. The high-grade, medium priced car of the future, I suppose, is going to be possible only in an economically conducted factory. I believe this means eventually that nearly all standard manufacturers will be making most of their parts in their own shops.

"In the methods of manufacture, too, there have been opportunities for extravagance and waste which, unless eliminated, will create disastrous disproportion between price and value.

"I warrant that most of the recognized standard manufacturers have been giving the public more value each year for their money, and I believe that most of these standard manufacturers have now reached the point where they are making only a legitimate manufacturing profit, and in some cases are not making nearly as big a percentage as is considered perfectly legitimate in standard lines."

WHERE GOOD ORDERS ARE WAITING

Singapore District Well Worth Cultivating, Says Consul—High Price No Bar to Business.

The importance of this market can not be too strongly emphasized, but caution must be exercised in the introduction of cars, writes American Vice-Consul General Figert, at Singapore, S. S. The percentage of cars furnished by the United States from 1905 to 1910 steadily decreased. The cause can readily be traced to the very poor models shown during that period. One high-grade car imported was abandoned after a short ownership fraught with trouble in obtaining duplicate parts, etc. Once these conditions are intelligently met, a large part of this great and rapidly increasing trade should be diverted to American channels.

One of the largest American motor car companies has recently established an agency in Singapore in charge of trained demonstrators sent from the United States. This agency will introduce four American cars—the Maxwell, Columbia, Sampson, and Stoddard-Dayton. Heretofore the market for low-priced cars has been practically monopolized by Ford. Another American motor car, the Hudson, has just arrived, and representatives of the Hupmobile are on their way to Singapore, having already received assurances from a local garage that if the car measures up to expectations, a large share of business can be promised the company.

Although the market has been 80 per cent British heretofore, there seems to be reason for supposing that the balance of trade will eventually swing toward American products.

There are 100 miles of road in Singapore, 800 miles in the whole of the Straits Settlements, and 3,439 miles in the Federated Malay States. The Singapore district is noted throughout the Orient for its excellent motoring roads. The present population of Singapore is estimated at 325,000, as against 228,555 in 1903. In 1901 the population of the Straits Settlements was 572,249; of the Federated Malay States, 678,595. At present it is safe to assume that it has passed the 1,000,000 mark.

In 1909 about \$371,000 worth of cars was imported and \$150,910 worth was exported to other countries, the more important of which are the Federated Malay States, the Netherlands Indies, and the Philippine Islands, the majority probably intended for local plantations. As there are 650 rubber plantations alone shown in the last directory (and many more not catalogued), the possibilities of the market can readily be seen.

Not only are machines necessary for the managers of large plantations, but the Chi-

nese, who possess most of the wealth of this district, are willing to spend large sums for cars luxuriously fitted out, and which will hold a family of 6 or 8. As a rule, the wealthy Chinese of Singapore have special cars for pleasure purposes. There is now on exhibition at one of the local garages a car costing \$8,000 gold purchased by a wealthy Chinaman from the settlement of Malacca. Money is no object where the question of luxurious fittings is concerned. It is probably that if a high-priced American car were simply shown in the market and prospective buyers were given trial runs, it would be the opening wedge of a profitable trade. No high-priced car has yet been offered for sale here; and, naturally, when a Chinaman wants a car he buys what is here for sale, and what he knows by actual experience to be reliable.

A few years ago there were less than half a dozen American cars in the market. These were introduced by the traveling representative of a New York general import and export house. Later a local agency was established, advertising space about 5 inches square was obtained in the newspapers, and up to date over 50 cars have been sold in Singapore, with the sales rapidly increasing. Practically the entire increase in the sale of American machines here is due to the activity of this one firm. The car referred to has practically displaced all foreign cars of the same grade, and at the present moment other garages are endeavoring to decide which American car shall be imported to compete with it. This has occurred with a low-priced car.

One important feature of the local trade which has to be either met or overcome is the insistence of buyers on special fittings. British and foreign manufacturers do not standardize their cars to the same extent as do Americans. Consequently quotations are made without including lamps, tops, extra tires, etc. As a result, all orders differ from each other as to fittings. Chinese are more difficult to satisfy in this respect than Europeans. Two cars of the same horsepower, build, wheel base, etc., may sell for prices differing \$500, due solely to the fittings, which, in many cases, amount to as much as 40 per cent of the value of the car. An invoice shown by a local importer covers just such a case. The car was purchased by a European, and the invoice was styled as "conservative." Special paint, decorations, upholstery, lamps, wheels, tires, mud guards, top, wind shields, etc., were included in the specifications. When the total of the fittings on this invoice was taken, it was found to be 35 per cent of the price of the car.

Another feature to be taken into consideration is the indifference of the wealthy Chinaman as to horsepower. He does not want speed for pleasure; he wants comfort and luxury; and the fact that one car is 10 horsepower stronger than another will not constitute a decisive argument in its favor if the fittings do not appear as good.

MAGNETO THAT INCREASES POWER

Splitdorf's Double-Distributor Type Now on Open Market—Its Advantages Due to Multiplication of Sparks.

Multi-point ignition, while fairly well known in the racing field and in engineering circles, has not been offered to the public until this year. Already there are indications that it will be used on a number of forthcoming models, by no means the least important circumstance being that the introduction of the double spark will involve an increase in power with no corresponding increase in weight or size. According to figures which are being issued by C. F. Splitdorf, of New York, in connection with the announcement of his new double distributor type magneto, the mere

SPLITDORF NEW TWIN-SPARK MAGNETO

use of twin sparks on opposite sides of a T-head engine may result in as great an increase of power as 15 or even 20 per cent. For the L type of cylinder an increase of from 8 to 15 per cent is claimed, and in the standard form of valve-in-the-head motor, an average of 10 per cent.

The Splitdorf double distributor magneto possesses this visible distinction from the standard type of high tension instrument, that while there is but one circuit breaker, as in the ordinary type, two high tension distributors are employed, as is implied by the designation of the type, one of them being mounted at either end of the magnets. Two sets of independent leads run from the distributors to the two sets of spark plugs, which, of course, likewise are independent in action. Their sparking is absolutely synchronized, however, for the reason that the primary current for both secondaries is let through a single distributor. The picture plainly shows the relatively simple and easily understandable nature of the arrangement.

The principle upon which the increased power depends is that of more rapid inflammation of the charge. As ignition occurs simultaneously at two different points in the cylinder it follows that the interval between the break of the interrupter points

on the magneto and the instant of entire inflammation is proportionately lower than when ignition is effected at one point only. In consequence the maximum pressure is realized much earlier in the stroke, notwithstanding the fact that the advance of the spark can be partially if not wholly dispensed with. Getting rid of the advance also involves a reduction in the back-pressure on the connecting rods and bearings, thereby rendering the action of the engine smoother and prolonging its life. As better combustion is assured with the multi-point sparking system, it also follows that engine efficiencies are apt to be higher when it is used, which is much the same as saying that the effective mileage of a gallon of fuel will be proportionately increased.

Tube That Extracts Water From Gasolene.

Notwithstanding painstaking methods of filtering gasolene, both before and after it is put into the tank of the car, the fact remains that engine operation often is more or less hampered through the presence of water in the fuel. For extracting such "last drops" as accumulate when ordinary precautions fail the Motor Supply Co., of Waterbury, Conn., has brought out a little device which is suggestively termed the Dry Gas tube. It consists of a small perforated metallic shell, something less than an inch in diameter and about two and a half inches long, which is packed with a substance which is capable of absorbing water, but which is not saturated by other liquids. When immersed in the fuel tank, therefore, the tube will absorb any particles of water which may come in contact with it, retaining the moisture for an indefinite period. When in use, a wire from the tube is attached to the lower side of the filler cap, so that the tube may be drawn out occasionally and its "charge" of water extracted. This is accomplished by the simple expedient of baking the cartridge in a moderately hot oven. While the device is capable of retaining three ounces of water—more than would accumulate in a fair sized tank in from four to six months' filling, the manufacturer asserts, it is recommended that the baking process be repeated about once in three months.

Brakes That Cause Wear on Bearings.

Despite the care that is being exercised in brake design, many brakes are so constructed that when applied, pressure is brought to bear on the shaft on which the brake drum is mounted. The fault, of course, is inherent to the construction and seldom can be remedied without making rather extensive alterations. It is noteworthy, however, as affording a possible explanation for the rapid wear of the rear transmission bearings of certain makes of cars which are arranged to be braked at that point.

REFINEMENT OF STEVENS-DURYEA

Distinctive Features Retained but Improvements Effectuated in Details—Prices Advanced but Equipment Enlarged.

In keeping with the present tendency to relieve the purchaser of the annoyance and expense of selecting and fitting up a full complement of accessories for his new car the Stevens-Duryea Co., of Chicopee Falls, Mass., has arranged to furnish a complete equipment with its model AA cars as hereafter produced. Whereas a liberal assortment of fittings has been included hitherto now practically nothing but the gasoline and oil will be required to put the machine in condition for the road. Among the striking features of the new specifica-

let and Berline, which complete the line, will continue to be sold at \$4,750, \$4,950 and \$5,000, respectively, with the additional equipment and including the complete array of interior accessories which has accompanied them hitherto. All bodies now are equipped with front doors, the gear shifting and emergency brake levers being mounted at the right end of the footboard, but inside the body. Save for the speedometer, the kick-switch of the new ignition system and the gas adjusting lever, a clean dash is now presented; the four control pedals being arranged on the incline of the toe-board.

In stating that the construction of the AA chassis is to remain practically unchanged it is implied that its manufacturer is as steadfast in adhering to the principle of the six-cylinder motor as it was five years ago, when it introduced its first sextuple engined car. Likewise the unit type

these thin-walled containers is liable to leakage through wrenching strains.

The cylinders of the engine, the dimensions of which are $4\frac{1}{4} \times 4\frac{3}{4}$ inches, bore and stroke, are cast in pairs and are designed with the valves placed side by side on the left of the power plant, their actuation thereby being effected through the operation of a single cam shaft. The latter is driven from the rear of the motor, instead of from the front, as is more common practice, a pinion actuated by the cam shaft gear serving to drive the magneto shaft. The circulating pump and force-feed lubricator are mounted on the right side of the motor and are driven by an auxiliary shaft on that side.

Double ignition is employed, as heretofore, but the Bosch "two independent" magneto system now is used, instead of the independent magneto and six-unit formerly employed. The new system embodies the

STEVENS-DURYEA AA SIX-CYLINDER: SEVEN-PASSENGER STANDARD AND FIVE-PASSENGER TORPEDO TYPES

tions, which are common to the five different types of open car in which the AA model may be obtained are a four-bow top, with side curtains and slip cover, adjustable windshield, a mechanically operated tire pump, speedometer and gasoline gauge, these being features which have been added to the former list. In addition the combination oil and electric side and tail lamps, specially designed headlights and Prest-O-Lite tank, demountable quick detachable rims, single tire irons—or double on the seven-passenger car—shock absorbers in the rear, foot and robe rails in the tonneau, horn and full tool equipment also are included. While in practically all respects the construction of the car is to remain unchanged the addition of the complete equipment has led to an increase in price of \$250 on the open models.

The standard five-passenger touring car will sell for \$3,750 hereafter, instead of \$3,500, as will the hooded dash, five-passenger and light four-passenger touring cars. The five-passenger torpedo will sell for \$3,850 instead of \$3,600, while the standard seven-passenger touring car will list at \$3,900. The prices of the limousine, landau-

of power plant with its unique three-point suspension system, which has remained unchanged in principle since it was originated in 1904, is continued. The crank case being continued to the rear forms a compact housing and frame for enclosing and supporting the fly wheel, clutch and change gear mechanism. An arm on either side of the crank case in front serves to support the forward end of the unit, while the rear end is pivoted from beneath by means of a king-pin arrangement, which is carried by a downward-arched cross-member of the frame. Frame weaving thus may go on indefinitely without subjecting the power plant to the slightest strain.

As proving the thoroughness of the designer's belief in the three-point support idea it also may be observed that the radiator and even the gasoline tank are supported in the same way. The radiator is carried by the frame members at either side and stayed by a rod, which also forms the ridge-pole of the bonnet. The gasoline tank, which is located under the front seat and so delivers its supply to the carburetor by gravity flow, being carried in the same general way, it follows that neither of

standard form of high-tension magneto and a single dash-mounted coil with kick-switch made integral with it and combined timer-distributor. The latter is mounted on a vertical shaft at the rear of the motor and immediately in front of the dash. It is in the same position as the commutator formerly employed, is perfectly accessible, and provides for a convenient arrangement of the wiring. As two sets of plugs are used, one set being mounted over each set of valves, it follows that either system may be used independently of the other, or both may be used at the same time.

The new air pump, which is of the four-cylinder type, is mounted under the hood in front on the left side of the engine, where it is firmly supported by an aluminum bracket. It is driven from the forward end of the cam shaft through an idle pinion, which may be shifted axially by means of a conveniently located lever, thus engaging or disengaging the driving gear and the pinion on the end of the pump shaft. The nipple to which the hose for inflating the tires is connected likewise is located in an accessible position.

Splendid features about the engine which

are of further note include the lubricating system. This is comprised of a force-feed lubricator, which supplies the main bearings of the crank shaft, the overflow from the bearings serving to replenish the supply in the crank pits, from which the remainder of the internal moving parts are supplied by the splash of the cranks. The individual feeds of the lubricator are provided with independent sight-feeds, permitting accurate adjustment to be made, while by a special refinement in the valve tappet mechanism surplus oil is trapped in the guides and returned to the case, instead of being permitted to work to the outside of the motor and collect dust and dirt.

SHOWING NEAT CONTROL ARRANGEMENT

The clutch is of the dry-plate multiple disk type, driving direct to the change gear mechanism, the usual intermediate flexible connection being dispensed with because of the unit construction of the plant. The design is such as to render all thrusts self-contained, save when the clutch is released, while the provision of a ball-bearing collar for effecting the disengagement of the plates ensures sufficient freedom of movement for the clutch shaft to warrant the elimination of the clutch brake.

The progressive type of change gear is retained, the mechanism being distinguished by the introduction of the neutral relation of the system between first and second forward speeds, as determined by the position of the gear shifting lever. The extreme rear lever position engages the reverse, while lifting the latch, which serves to locate the intermediate speed when the lever is moved forward from neutral, permits it to be moved to its extreme forward position, thereby engaging the positive clutch which affords the direct drive or high speed.

A central lubricating chamber in the cross which forms the central member of

the universal joint construction in the propeller shaft ensures the thorough oiling of the parts at all times, the oil being distributed by centrifugal action. Two joints are used, the torsion stresses of the driv-

NEW TIMER-DISTRIBUTOR ARRANGEMENT

ing bevel gears being absorbed by means of a bar at one side of the shaft, which is anchored to the cross frame member in the waist of the chassis. In mounting the universals on the shaft the squared method of connection is employed instead of the less expensive method of keying. Indeed, the use of the squared shaft ends in place of round surfaces with keys, is one of the structural features peculiar to this member of the sterling group of New England cars.

Spur differential gears are used in the

STEVENS-DURYEA ADJUSTABLE BRAKES

original full-floating rear axle. The wheels and shafts turn in annular ball bearings, as do the change gear shafts. The front wheels, however, are mounted on taper roller bearings. Semi-elliptic springs 48

inches long, instead of 40 as formerly, are used in front, and three-quarter elliptics in the rear. External-internal brakes are used, the service set, which is of the contracting pattern, being equipped with a simple and effective adjustment by means of wing nuts, which are readily accessible. The standard wheel base is 128 inches and the tire equipment for all cars except the seven-passenger touring type is 36x4½ inches, front and rear. The large touring car is fitted with 36x4½-inch tires and 37x5 in the rear. Among further refinements of detail may be mentioned the provision of large-sized grease cups on all spring hanger bolts and even on the levers, the placing

THE NEW TIRE-INFLATER INSTALLATION

of the steering connections above and at the rear of the front axle and the provision of locks for the tire irons and the various battery and tool lockers about the car.

Austrian Army's Automobile Equipment.

Austria is going in for military motor vehicles with considerable ardor. Already the army authorities own 90 road units, of which 29 are tractor wagons, each equipped with an 80-horsepower motor and arranged to haul three trailers. There are, besides, eight traveling work shops, two complete road trains, 28 motor lorries, 12 light vehicles, two trucks equipped with cable winches and nine searchlight wagons. The military organization also is carrying out an extensive subvention plan which ultimately will provide over 260 trucks for service on requisition. Some \$400,000 have been provided for the subsidy of industrial machines of the stipulated five-ton pattern, each equipped with a trailer. Owners of such equipment are entitled to a subsidy of \$1,500 the first year of ownership, while during subsequent years an annuity of \$200 will be paid. While in service maneuvers operators providing trucks will draw \$7 per day per machine.

The Closed Car; Large Differences Made by Small Lines

The placing of a line—just one single line, curved or straight, often is the means of making or marring a picture. If the picture is a portrait, the whole expression may be changed with a stroke of the pencil or brush; if it is of an inanimate object, the omission or the addition of a line may change its whole aspect. And exactly the same rule obtains in the designing of automobile bodies. To be successful, the automobile designer must be just as much an artist as an artisan. Though an automobile is not supposed to be a "joy forever," it must be, at least, more or less a "thing of beauty." But, primarily, it must be a "thing of comfort," to paraphrase the

dendency to get away from the coach idea by presenting a straight-line effect with a minimum of curves and other embellishment. Others, equally recent, reflect in a strong degree a tendency toward curves, and both types have an almost indefinable air of beauty about them. Of the former, the Stevens-Duryea "Berline," which is illustrated in Fig. 1, suggests little of the coach with its straight lines, and yet the division of the body between the driver's and the passenger's compartments does suggest the coach, inasmuch as the old French public stages invariably were divided into three compartments, "the coupe in the front, the interior in the middle

front end of the door. If that little curve at the bottom of the front of the door had been reversed the effect would have been entirely different. The body would have appeared like a single body and either end viewed alone would not have appeared quite so complete. As it is, the whole is harmonious and yet either end viewed separately is complete. Another of the interesting structural details of this particular body is the curved roof. From a purely esthetic point of view, the combination of curved roof and outwardly curving ends is pleasing; from the more practical point of view of the passengers it is pleasing also in that it provides a more commodi-

TYPES OF FULLY ENCLOSED CARS—FIG. 1—STEVENS-DURYEA BERLINE; FIG. 2—COLE "LONDON LIMOUSINE"

old saw, and there are few problems which face the modern designer that are more difficult of solution than the combination of pleasing lines and comfortable interiors in closed bodies, whether they be of the orthodox limousine type, the small coupe, wherein two is company and three undoubtedly constitutes a crowd, the landaulet or the completely enclosed body which is variously named but which more generally is styled the Berline or Berlin body.

Just what will be the ultimate idea embodied in the construction of closed bodies, or the impression which will be conveyed by their appearance, is difficult to forecast. The first closed bodies that were built, and for that matter the open bodies as well, naturally followed the general lines of and suggested the old time coaches. That is to say, they were creations of flowing lines and multitudinous curves. Later, however, with the development of the automobile, new types of bodies were evolved, and though in appearance they suggested in constantly lessening degree their prototypes of the stage coach age, they still retain, even today, not a few of the earmarks of those antiquated diligences.

Several of the late designs show a ten-

and the rotonde in the rear." The "rotonde," in this case, is missing, of course, though the "interieur" and the "coupe" remain.

One of the peculiarities of this body, and in fact of nearly all other closed bodies, is that each half—if it may be so styled without danger of straining the meaning of the word overmuch—forms a distinct unit when viewed alone. The rear compartment is complete without the forward one and the forward one is complete without the other. Which is to say, that if a card is placed over the illustration so as to cover either one or the other, the remaining compartment will not look outre. Both are complete, finished bodies and this effect is obtained by the simple expedient of building the front ends of each of the "halves" with a forward curve at the front and bottom. Naturally the slight difference in the height of the window sills and the difference in color increases the effect, which, however, is due principally to those apparently insignificant curves.

The same effect may be noted in Fig. 2 if either end of the illustration, which shows the new Cole "London limousine," is covered up to, but not including, the

ous interior, both of the considerations of beauty of outline and comfort thus being happily obtained.

In the Regal "20" Colonial coupe, which is illustrated in Fig. 5, may be noted almost the same curved roof as is shown in Fig. 2. It differs, however, in that the longitudinal curve is more marked while the transverse curve is less marked than in the other. The unmistakable colonial effect is obtained through the medium of the latticed windows, which, together with the harmoniously curved roof and ends, give the whole body an air of beauty and at the same time of strength and stability. Further increasing the appearance of stability, the underhung frame also permits of a low entrance, a feature which is more or less in demand by the fair sex.

Illustrated in Fig. 6, the Brush coupe resembles the Regal only in that like it it is driven from the inside. It has but a single door, and as the car is operated from the left side, the door is at the right. Incidentally the picture shows graphically one of the principal advantages of the left hand drive, viz., the facility with which passengers may enter or leave the car when it is drawn up to the right hand curb, in which

LANDAULET DESIGNS—FIG. 3—LOCOMOBILE CLOSED FRONT; FIG. 4—STEVENS-DURYEA SHELTERED FRONT

position vehicles usually must be stopped. The roof of the car also shows a slight curvature, allowing more head room, and the same forward curve at the bottom of the front panels, which gives a finished appearance, is plainly visible.

For those who prefer a car which can be made into a closed or semi-open one at will, the landaulet has been devised, and though all landaulets are alike in general principle, there scarcely are two which are alike in other respects. In both of those which are illustrated by Figs. 3 and 4, the former being a Stevens-Duryea and the latter a Locomobile, the same forward curve at the front of the back doors which gives the appearance of two separate bodies, while at the same time preserving the harmonious effect of the whole, again is noticeable. Added, primarily to increase the comfort of the driver, the high front doors and the partial closing in of the front compartment is shown in Fig. 4, tend to heighten this separate body effect, though such features hardly can be said to detract from the general appearance of the body. Slightly less protection for the driver almost is balanced by the greater ventilation which the lower front doors and otherwise open front compartment on the Locomobile body permit.

Concretely, there really is very little difference in appearance in many of the ex-

isting types of closed bodies. In the majority of cases the differences which are apparent are due to slight variances, and while it almost might be said that the whole effect is changed, it often is difficult to determine just what causes the dissimilarity. Also in nine cases out of ten all such slight changes or modifications are intended primarily to increase the comfort of the passengers rather than for the sake of mere appearance. For instance, in Fig. 7, which shows part of the Chalmers "Thirty-six Berlin" limousine, the front of the body is carried out to the engine hood, which is to say there is no skuttle, and while this necessitates a slightly longer body to permit of sufficient leg room for the operator, and thereby undoubtedly changes the general aspect of the body, it also allows of larger windows and incidentally more light in the car and on the dash apparatus.

Illustrated in Fig. 8, which is Owen practice, on the other hand, is a well-defined skuttle, and the front compartment therefore is slightly shorter. Protection from the glare of the sun which the extended roof affords is obtained, but properly speaking there is no real extension, or only a very slight one, the front of the body being brought up to meet the roof in a gradual curve. Though the fact that the car is of the left hand variety naturally

changes its appearance to a marked degree, it is apparent that it was for other reasons that the steering wheel and control levers were so placed.

Knox construction, illustrated in Fig. 9, also provides a skuttle and, like the Owen, curves at the bottoms of the doors are symmetrical. Narrow windows and a fairly long extension roof, while allowing of more light and added protection, respectively, also serve to alter the appearance of the body. Though Fig. 10 shows but the front portion of the Stevens-Duryea enclosed limousine, it is a noticeable fact that it appears perfectly complete in itself, the effect being obtained, as stated previously, by the forward curves at the front of the rear doors. The slightly shorter extension roof and larger windows allow of a lighter interior, and another of the points of variance—one which goes further toward changing the whole appearance of the body than might be supposed—is that the curve where the skuttle joins the dash is concave rather than the more conventional convex.

Coupe bodies usually follow the general lines of the larger closed bodies, though as often as not they possess a distinct individuality all their own. Thus in Fig. 11, which shows the new Cole Colonial coupe, an unmistakable limousine-effect is obtained by the swinging glass front, the advantage

FIG. 9—CHALMERS

FIG. 10—WARREN-DETROIT

STUDIES AFFORDED BY CONTRASTING CONSTRUCTIONS OF COUPE FRONTS

of which is that the operator may look under it and still be protected in case of stormy weather, while at the same time a degree of ventilation scarcely possible otherwise is obtained. On the other hand, its equally unmistakable colonial effect, which is due to the curved roof and front and the latticed windows, is unlike the usual type of limousine.

In Fig. 8 the same swinging glass front is noticeable and in addition slightly more leg room is provided by a deeper skuttle. The treatment of the center panel of the door also is apparent, in that while it serves no particularly useful purpose, it relieves the car's somewhat sombre appearance. Permitting of a lighter interior and more room between the passengers and the actual front of the car, the curved glass front of the Chalmers coupe, shown in Fig. 9, gives the car the appearance of what in carriage parlance is known as an extension brougham. Another of the distinctive points is that the doors open in the reverse

direction to that in which doors generally are arranged. As to whether or not this is an advantage there is considerable difference of opinion, but a number of recent converts to it seem to show a tendency in its favor.

Somewhat the same extension brougham effect is apparent in the Warren-Detroit coupe shown in Fig. 10, with the exception that in this case it is obtained through a sort of bay window effect. Manifestly, however, it is results rather than effect which is sought after by the designers, the results being lighter interiors, better ventilation and more room. A close examination of the picture reveals the fact that this body also is equipped with a swinging glass front which may be opened or closed at will.

As may be seen in the accompanying illustrations, Figs. 15 to 18, doors are susceptible of a variety of treatment, and that the treatment almost invariably is the reverse of that which obtained in the old days of

the stage-coach, when curves generally were made symmetrical. The Pierce-Arrow George Washington coach door shown in Fig. 15 is noteworthy because of the black beading at the edges. The treatment is attractive, it relieves the monotony of a single color, while at the same time the scheme is not obtrusive. Practically the same scheme is carried out on the door shown in Fig. 18, though the difference in the curved lines in one and the almost severely straight ones in the other is apparent at once. The low and easy entrance of the Thomas brougham town car, shown in Fig. 16, made possible by the use of a double drop frame, is the principal point of interest. Fig. 15 shows the conventional type of limousine door, which has been popularized through its very simplicity.

Contrasts are quite as marked in the backs of closed bodies as they are in fronts, and in this case as in the case of fronts, though beauty of outline is one of the principal objects of the designer, other con-

DEPICTING CONTRASTS IN THE TREATMENT OF LIMOUSINE DOORS

siderations, such as roominess and comfort, seldom if ever are sacrificed for mere looks. The graceful curve where the back is carried up to meet the roof in Fig. 22 unquestionably enhances the beauty of the body, but primarily it gives greater roominess. Nearly all limousine bodies now are extended well out over the wheels, and in this way the width of the seat is increased several inches, an example of this arrangement being shown in the same picture.

The arrangement in Fig. 21, which shows a Chalmers coupe, is entirely different. Less room is necessary in the body and therefore it is not carried out over the wheels. The placing of the gasoline tank on the rear allows of more storage space under the seats, and running boards, which might otherwise be encumbered with tool

and battery boxes, may be kept clear. The Locomobile body shown in Fig. 20 illustrates even more clearly the manner in which some bodies are carried out over the wheels to allow of greater seating capacity. The effect is increased by the shape of the mud guards. Fig. 19, in which the back of the Cole Colonial coupe is depicted, shows to better advantage than does the picture of the front of this car, the unmistakable colonial effect which the harmoniously curved lines and latticed windows give. But though the gracefully curved back and roof undoubtedly make for attractiveness, they also increase materially the comfort of the passengers, the convex roof allowing of greater headroom and the inclined back permitting at once more room and more comfortable seats.

Teetor Shows Magneto's Possibilities.

It has been stated, and probably it is true, that the common or garden variety of camel can go 14 days without "lubrication." Which is not extraordinary when it is considered that camels are "fearfully and wonderfully" built to meet just such exigencies. Magnetos, on the other hand, are not supposed to be run without lubrication, but that they will do so, though the practice is not to be recommended, was demonstrated by Charles N. Teetor, of Hagerstown, Md., who reports that he ran his Remy magneto not merely 14 days, but 14,000 miles, without oiling it or making an adjustment. Despite the unusually severe treatment, which was spread over several years, the magneto gave no trouble and continued to spark with its accustomed vigor.

ILLUSTRATING DIFFERENCES IN LIMOUSINE AND COUPE BACKS AND WINDOW EFFECTS

CHAUFFEUR DEFENDS HIS CALLING

**Crooks Comprise Small Minority—Blames
"Schools" for Most Evils—Wherein
Chauffeurs and Drivers Differ.**

"It is all very well for garage owners and garage managers to try to make it appear that chauffeurs are responsible for all the evil in the business, but if some of those men would look in the mirror occasionally they would be pretty apt to discover a few spots and a few streaks on their own persons," remarked a veteran driver, referring to the series of articles on the subject which have appeared in the Motor World.

"There are lots of tricks in the garage business, and there are lots of garagemen who are not above practicing them. The one who at a recent public hearing in New York denounced chauffeurs as a lawless class may have won considerable applause for himself, but I doubt whether he served any good purpose. We are not all crooks, nor do I believe there are many more crooks in this business than in any other. The jails of this country are pretty well peopled with bankers, but the fact does not imply that all bankers are crooks, nor that they comprise a lawless class.

"I have been driving automobiles for ten years, and think that is long enough for me to have become at least fairly well acquainted with not only chauffeurs but garagemen, and let me tell you that the chauffeur, like every other man, is largely influenced by his surroundings. If the garage in which he spends most of his time is conducted 'on the level,' the chauffeur himself is apt to be 'on the level.' The garageman who harbors the grafter, the joy-rider and other types of crooked driver is just as bad as the driver. The trouble with the average garage owner is that he looks at the almighty dollar even a little harder than the average man in other walks of life and closes his eyes to many things, when he does not actually become a party to them, solely because he is fearful that a dollar may get away from him.

"If any one truly desires to get at the real root of the so-called chauffeur evil, however, he need not go much further than the so-called automobile schools, which turn out chauffeurs almost while you wait. It looks as though about every other young man above the age of 17 imagines there is a lot of money and very little work in driving automobiles. I honestly believe that one-half of the men who handle the levers of passenger elevators in apartment houses and office buildings are possessed of the notion that they are qualified to become chauffeurs on short notice. The automobile schools appeal strongly to this sort of man and, as a result, the market is simply flooded with so-called chauffeurs who pos-

sess diplomas, or whatever you call the pieces of paper the schools furnish to their graduates.

"While it may be possible to learn how to push a lever or turn a steering wheel in the course of a week or two, it stands to reason that no man can even begin to learn the complications of a gasoline motor, or an automobile, in a month's time, yet thousands of so-called graduates are turned loose on the world who have nothing more than ability to drive a car and a very much confused knowledge of its internal arrangements. The woods are simply full of these 'graduates.' They can be hired for a song. In fact, they have pretty nearly ruined the chauffeur business.

"The chief result which the so-called schools have attained has been to let loose this army of half-baked chauffeurs and to bring down the wages of the really competent men. Garages and salesrooms are overrun with drivers seeking work, and an advertisement for a chauffeur in almost any New York daily paper will bring from two hundred to five hundred applications, no matter what may be the wages offered. If the 'schools' continue to turn them out at the present rate, the Lord knows what the end will be.

"The so-called graduates form a distinct class of chauffeur, and in a category not far removed is the chauffeur who gets into the business via the garage route, that is, the washer or helper in a garage who picks up a superficial knowledge of motors and acquires some skill in handling steering wheels and levers, but who is no more fit to take care of a car than a ten-year-old child. Occasionally a competent man may be developed by garage work, but if so it usually is because he has a natural aptitude for mechanics. To my way of thinking, however, the garage-bred chauffeur constitutes almost an impossible class. I certainly would not trust him with my car if I owned one.

"These garage-bred chauffeurs and the automobile school 'graduates' have done the business a lot of harm, and their willingness to work for a bare living places a premium on their grafting propensities, if they are possessed of any, and wittingly or unwittingly the automobile owner works his own injury when he employs them. Although their wages seem small they manage to eke them out by demanding their commissions.

"The trouble with the average owner is that he rarely, if ever, distinguishes between a chauffeur and a mere driver. A chauffeur knows his car, and every part of it. He has served his time in a factory or a shop and, therefore, is thoroughly competent to care for a car that is placed in his charge; and he has acquired, after thousands of miles of driving, that skill and clear-headedness which comes only with extended experience. Automobile owners ought to be willing to pay a decent wage

for such services, but, as I said, too many of them appear to think that ability to handle the steering wheel and levers is all that is necessary to constitute a skilled driver—a man who can be trusted with the lives of the members of their own families.

"Most of the owners who pay the smallest wages require the greatest service, and they are directly and indirectly responsible for a lot of the grafting with which the chauffeur is charged. I know one prominent physician in this city who last winter employed an automobile school graduate to drive his car for \$60 a month. It was the 'graduate's' first job and he imagined that the future would bring something better, but he soon discovered that driving the doctor's car was the smallest part of his work. For his \$60 he had to go to the house in the early morning and attend to the furnace, then act as butler at breakfast, tidy up the doctor's office and usher in his patients when they called. After lunch he drove the doctor on his rounds, and later took the physician's wife for a drive in the park or a tour of the shopping district. At dinner the 'chauffeur' again played the part of butler, and thereafter was free to devote himself to the care of the car, or whatever else he pleased. As a result, this doctor spent, in repairs alone, more money than if he had employed a competent chauffeur and a second man to attend to his household affairs.

"I know another chauffeur who is employed by a man in the suburbs and who receives \$100 a month for chauffeur and attending to the garden, while the chauffeur's wife serves as the madam's maid.

"Of course I do not blame owners for taking advantage of the situation, but it seems to me that more of them should distinguish between mere drivers and competent chauffeurs, and be willing to pay the price for competent service. There was a time, of course, when chauffeurs had an exaggerated idea of their value, and asked and obtained fancy salaries, but that was some years ago, when they tried to make themselves and the public believe that they were akin to locomotive engineers and should be treated and paid accordingly, and when some of them even thought that they were demeaning themselves and playing the part of a footman if they were expected to wear leggings and to open the car door for the women-folk. Those days have passed, however, and to-day good mechanics, who are careful and competent drivers, can be had for \$25 a week, and occasionally for less. When they are required to take care of more than one car, it is my belief that they are entitled to more money.

"I am not advocating high wages as a solution of all evils, but I do believe that a competent man is worthy of his hire and that it is up to automobile owners to distinguish such men from the horde of half-baked graduates and garage-bred drivers,

who are drivers and nothing more. When they make such distinctions they will discover that they will obtain more and better use from their cars, and at very much less expense, and when they investigate the characters and capabilities of chauffeurs who apply for work even half as carefully as they investigate applicants in other lines, the crooks and the grafters will be compelled to go elsewhere, and as a self-respecting man I will be as glad as anyone to see them go."

Another Chauffeur Expresses His Views. To the Editor of the Motor World:

After reading the article of the "night man" in last week's Motor World, I think that it becomes some one to take the part of the chauffeur, who, I believe, was set upon more than the "night man." I give the latter credit for a very good article, expressing some very good points, but on our part I would like to say that if our esteemed friend, the garage owner, would start at home and fix up some of the faults that the "night man" tells about, he would do a lot of good for himself, for the owners of the cars, for the chauffeurs and for his own help—more good, in fact, than he has done by talking about things of which he knows only one side, and which tend to lead narrow-minded people like himself to believe that all chauffeurs are alike, and nothing but a pack of crooks or thieves.

I am a chauffeur myself, and although I may not be able to write articles for publication as well as our friend, still I would like to state that if our friend would visit some of the good garages—those that do not harbor a "lot of thieves"—instead of forming opinions from his own garage, he would have a different opinion of us. For I know there are a lot of honest men in the business, although it is only too true that there are a good many who are not straight. Still, it is unjust to us to make us appear all alike, just as it would be foolish for us to believe that all garage owners are narrow-minded.

As to the "commissions": They are an injury to the chauffeur, and I think I voice the opinion of 75 per cent. of the men when I say this; for if there were more honest chauffeurs, owners could afford to pay better salaries; and if garage owners would pay their help better wages and no commissions to the chauffeurs, the owners would get better service. Instead of paying a bill that has been enlarged 20 per cent., in order to pay the chauffeur his 5 or 10 per cent. (as the case may be), the owner would pay only for the actual amount of supplies and repairs and would save from \$5 to \$20 per month. Besides, if he would get a good man and pay him a little better wages, he would get better service from the chauffeur, the garage and everyone connected with it, for the same or less money than he is now paying.

A Member of the Chauffeurs' Protective Association of New York.

COUPLING THAT ASSISTS MAGNETO

Bosch Devises New Form That Reduces Wear and Serves Other Purposes— How It Absorbs Shocks.

Only a small amount of power is required to drive a magneto, but the fact remains that the resistance of the armature is irregular, the turning action involving a "bump" corresponding to the peak of the current wave, or instant of maximum inductive effect. The result of this irregular resistance is that any lost motion in the driving gear is apt to be accentuated, with consequent wear of the parts. To obviate this difficulty, the Bosch Magneto Co., of New York City, just has brought out a new form of driving coupling which possesses all the elements of the usual flexible joint and at the same time is capable of ab-

commonly is employed for the purpose. Should the shafts be slightly out of line, or should the driving member be sprung so that the driving end of the coupling failed to run true, the driving action—which is to say the service of the magneto—would continue without interruption.

The arrangement is useful not only in reducing the wear of the connecting parts and in relieving the driving gear of stresses arising from disalignment of the shafts, such as is liable to occur through careless assemblage or as a result of accident, but it also serves in a measure to silence the action of the motor. It has come to be thoroughly understood that engine noise results from a multiplicity of small clatters, and the reduction of any such sounds is a step toward the quiet-running machine that is so much to be desired.

Britons Revise Nut and Bolt Standards.

After much deliberation the Engineering Standards Committee, which is composed

BOSCH NEW SPRING COUPLING FOR MAGNETO DRIVE

sorbing the unequal stresses in the drive. The shock absorbing property is derived from the use of a flat spring, which while transmitting the required amount of power, yields to the sudden load of the period of maximum electrical resistance just sufficiently to prevent a shock to the parts. The armature revolves much more smoothly in consequence, while the driving gear is correspondingly preserved from vibration and wear.

The new coupling is made in two parts, the accompanying illustration showing it in complete form and also with the two essentials withdrawn from engagement in order to indicate their relative purposes. One is cone-shaped, with a crowned end, while the other carries a cross bar which is of laminated spring steel construction. The crown piece is formed with opposed slots in its working end, which are fiber lined, and adapted to engage the ends of the spring. The latter not only permits a sufficient amount of temporary lag in the armature shaft to prevent the jolting of the mechanism, but also permits a slight amount of relative movement between the two shafts which it connects, thus serving the purpose of the ordinary universal joint, or the Oldham coupling, which more

of representatives of the leading technical institutions and societies associated with the automobile industry in Great Britain, has issued recommendations for new standards of nuts and bolts to be used in motor car construction. The specifications recommended are adapted from the B. S. F. standard—the British standard fine threads of common practice. In the 1/4-inch diameter the pitch has been changed from 25 to 26 threads per inch, while a new 9-32-inch size has been introduced having 26 threads per inch. For special sizes the use of the Whitworth thread is recommended with a uniform pitch of 16 threads per inch, irrespective of bolt diameter. The British standards for widths of nuts and bolts across the flats are retained, but are applied to a size larger than in common practice, the object being to save weight and space. Thus, the width across the flats of a 3/4-inch bolt head is that of the ordinary standard 11-16-inch bolt head. Though the nuts and bolts are considerably lighter than the ordinary British and Whitworth standards they take the same sized wrenches, with the exception of the 1/4-inch and the new 9-32-inch sizes, for the use of which a smaller wrench becomes a matter of necessity.

WHEN LEARNED JUDGES DISAGREE

(Continued from page 466.)

of rubber tires and rims covered by the Grant patent manufactured by either of the said companies and that they will be able to show that the rubber tires and rims dealt in and sold by these defendants were manufactured by the Kokomo Rubber Company and that, therefore, Seim and Reissig had a perfect right to use or sell them as they are protected by the decree in the Indiana circuit above referred to, not appealed from or reversed.

That the wheels and parts complained of and dealt in and sold by the defendants are covered by the Grant patent and infringe same cannot be questioned. The first question is, were these tires and rims made by the Kokomo Company? I have read the affidavits of William Seim, Gustave Reissig and Dorothy Seim, presented and read in opposition to the granting of this motion for a preliminary injunction and I fail to find evidence therein that either the rims or tires or wheels dealt in by the defendants here were made by the Kokomo Rubber Company or by the Goodyear Tire and Rubber Company or by the Victor Rubber Tire Company and hence fail to find evidence that these defendants are protected in using, dealing in or selling these parts or any of them, or the vehicle wheel complained of even if the decrees referred to protect those companies and all who purchase from them or either of them against the charge of infringement.

I do not need to decide that such decrees do or do not protect those companies and those who deal with them or purchase from them directly or from those who purchase of dealers to whom such companies sell, in passing on the question of a preliminary injunction.

The petition for intervention filed by the Diamond Rubber Company of New York, alleges, in substance, that it is engaged in purchasing, handling, using and selling rubber tires and rims decreed to be covered by the Grant patent in suit, and that such articles so covered by the Grant patent are manufactured and sold to the petitioner, Diamond Rubber Company, by the said Kokomo Rubber Company. The petition also alleges that the Kokomo Company has the right to manufacture, use and sell such tires under a judicial decree of the United States Circuit Court for the District of Indiana, seventh circuit, and that the right of the Diamond Rubber Company to handle, use and sell such tires and rims has been judicially found and assured to the petitioner by the decree of the circuit court and Circuit Court of Appeals, second circuit, affirmed by the Supreme Court of the United States. "To sustain this contention the petitioner presents a certified copy of the mandate of the Circuit Court of Appeals, second circuit, above referred to, as well as the decision of the Supreme Court of the United States in the same case. The petitioner further alleges that the defendants here, Seim and Reissig, are co-partners, doing business in the city of Albany, and that they purchase the infringing articles dealt in by them from the petitioner, Diamond Rubber Company of New York, and that same are made by the Kokomo Rubber Company of Indiana. The contention is that the defendants here, Seim and Reissig, having purchased these articles of the Diamond Rubber Company and the Diamond Rubber Company having purchased them of the Kokomo Rubber Company and a decree of the circuit court in Indiana having been entered adjudging the patent invalid the defendants are protected by said Indiana decree and have the right to deal in and sell these infringing articles. In short, it is contended that infringing articles covered by this patent made by the Kokomo Company may be sold anywhere and everywhere in the United States by parties or persons who obtain them directly or indirectly from the Kokomo Company.

James D. Hurd, the complainant here, holds an exclusive license under the patent in suit for making and selling these rims and tires and wheels in the State of New York. The Diamond Rubber Company desires to be made a party defendant so it

may come in in this suit and raise these questions and make this alleged defense in person.

I see no reason for allowing the intervention if, notwithstanding the decision of the Supreme Court of the United States above referred to, the Kokomo Company has the right to make and sell the alleged infringing articles anywhere in the United States or anywhere in the seventh circuit, and is protected in so doing by the decree of the circuit court before referred to, and purchasers of such articles from the Kokomo Company in the seventh circuit have the right to use and sell same anywhere in the United States and are protected by said decree in so doing, and purchasers of such articles in the second circuit are protected in using and selling them because made by and obtained from the Kokomo Company. The defendants here, Seim and Reissig, can set up that defense, show the facts and prove that the alleged infringing articles made and sold by them were made by the Kokomo Company, sold to the Diamond Rubber Company and by it sold to these defendants and the defense will be complete. The presence of the Diamond Rubber Company, an intermediary purchaser and seller, in this suit is entirely unnecessary. If it desires to defend this suit in behalf of these defendants it can furnish and pay counsel and furnish and pay witnesses, in short, bear all the expenses and take upon itself the burden of the defense. The Kokomo Company does not come into this court asking to intervene or seek to defend dealers in these infringing articles alleged to have been made by it.

The broad allegations of the petition for intervention must be deemed qualified by the certified copy of the decree filed herewith and which shows that the only right of the Diamond Rubber Company, if any, to make, use and sell these articles which infringe the Grant patent is derived from the decree of the United States Circuit Court in Indiana.

If that decree of the circuit court in the action referred to does protect the Kokomo Company against the charge of infringement in making and selling rubber tires, rims and other parts which in fact infringe the Grant patent I am of the opinion and hold that such decree does not protect users and sellers of those articles, made by the Kokomo Company in Indiana in the second circuit. If it shall be held that the decree of the circuit court in the district of Indiana not appealed from or reversed establishes in that circuit that the Grant patent is invalid notwithstanding the decision of the Supreme Court of the United States, still, that decree does not establish that as the law in the second circuit. The decision of the Supreme Court of the United States holding this patent valid must prevail in the second circuit. It must be the law here that the patent is valid. There is no judgment or decree anywhere that the Kokomo Company has a right as licensee to make and sell these articles under the Grant patent. The decision of the circuit court of Indiana is that the Grant patent is invalid,—that is, it has no existence. The decision of the Circuit Court of Appeals in the second circuit sustained by the Supreme Court of the United States is that the patent is valid.

The Circuit Court of Appeals in the second circuit did not adjudicate or determine that the Kokomo Company has the right to make and sell articles which would infringe the Grant patent but for the decision of the circuit court of Indiana. The Supreme Court of the United States has not so adjudicated. The Circuit Court of Appeals in the second circuit has not adjudicated or determined that purchasers and users of the articles referred to who obtain same from the Kokomo Company are protected in the use and sale of same in the second circuit. All the Circuit Court of Appeals in the second circuit adjudged or determined was that the injunction in Consolidated Rubber Tire Co. and Rubber Tire Wheel Co. v. Diamond Rubber Co. of New York, should exempt the defendant from its operation in handling, using and selling rubber tires and rims covered by the Grant patent, manufactured by the Kokomo Rubber Company.

The effect of the reservation made by the decree of the Circuit Court of Appeals in the second circuit is thus stated by the Supreme Court:

"The final contention of the Rubber Company is

that the Grant patent having been declared invalid by the Circuit Court of Appeals of the Sixth Circuit and by the Circuit Court for the District of Indiana in the Seventh Circuit, the Rubber Company should not have been enjoined from the handling or sale of tires manufactured in the Sixth and Seventh Circuits, and cites *Kessler v. Eldred*, 206 U. S. 285.

"The Court of Appeals practically reserved the question. It modified the decree of the Circuit Court so far as it prevented the handling, using or selling tires and rims authorized by any judicial decree, recognizing, as it said, the applicability of *Kessler v. Eldred*. But it further said:

"Whether it should be given a broader interpretation is a question upon which we express no opinion, deeming it more prudent to wait until the facts are fully developed.

"There is no occasion for attempting at this time to anticipate the future for a contingency which may not arise. * * * To provide in a decree that a defendant is not enjoined from making, using and selling devices which do not infringe or which have been licensed, seems unnecessary. The doctrine of *Eldred* and *Kessler*, if carried to the extent contended for by the defendant, will introduce radical and far-reaching limitations upon the rights of patentees. These questions may not arise in the case at bar, but if they should, the court should have the facts, and all the facts, before attempting to decide them."

"We concur in these remarks."

This is far from an adjudication that these defendants have the right to use, deal in or sell rubber tires and rims or vehicle wheels which in fact infringe the Grant patent, in the second circuit because made by the Kokomo Company in the seventh circuit.

If it is finally held, where a patent is litigated between the owner thereof and an infringer and the same is held invalid by the Circuit Court of a given circuit and the case is not appealed, and the same question is litigated in another circuit between the same complainant and a different defendant, alleged infringer, and the case goes to the Supreme Court of the United States and the patent is held valid, that the defendant in the first suit has the right to manufacture and sell articles plainly and indisputably covered by the patent all over the United States and that purchasers from such defendant everywhere in the United States are also protected in so using and selling such articles, the patent will afford little if any protection to the owner. The monopoly of the patent will be shared by the defendant in the suit referred to and he will have the same right to make and sell possessed by the owner of the patent and all purchasers and users under him will be protected. I am not prepared to assent to any such result. Articles which in fact infringe this patent, if sold or used outside the circuits where the patent has been held invalid, must be held to infringe and those who sell or use outside the circuits referred to must be held to be infringers even if the articles so sold or used were made and put on the market by a person or corporation as to whom the patent was so held invalid.

The decision of the circuit court in the district of Indiana may be the law there as to the Kokomo Company and those who deal with it there, but it is not the law of the second circuit or in any way binding on the courts in the second circuit. While articles made by the Kokomo Company and sold in the second circuit were excepted from the operation of the injunction in the case referred to it was not decided that the users and sellers here had any right to use and sell. As said by the Supreme Court the Circuit Court of Appeals of the second district reserved the question. The question is now before me in this motion to intervene and is a practical one. There is no rule of comity which requires the Circuit Court of the United States in one circuit and state to recognize the decree of a circuit court of the United States in another state and circuit in such a case as this, especially when the Supreme Court of the United States has decreed differently as to the same subject matter, viz., the validity of a patent. Neither the Kokomo Company nor the Diamond Rubber Company of New York is a licensee. The adjudication in Indiana has no force in New York. Sup-

pose the decree of the circuit court in Indiana is to be given the effect of holding that the Kokomo Company had a right to make and sell the wheels or the parts complained of its effect may be confined to Indiana and if the circuit court of New York holds differently between other parties as it must in view of the decision of the Supreme Court, then all persons residing and acting in New York other than the Kokomo Company are subject to the decree made by the circuit court in New York. Sued in Indiana circuit court the Kokomo Company and possibly those purchasing from it would be protected, but sued in New York, second circuit, purchasers from the Kokomo Company would not be. The territorial jurisdiction of the two courts is separate and distinct.

In *Kessler v. Eldred*, 206 U. S. 285, Kessler was the maker and seller of electric cigar lighters and had customers therefor throughout the United States. Eldred was a competitor of Kessler in the business of making and selling cigar lighters. Eldred owned a patent for an electric lamp lighter, known as the Chambers patent. Eldred brought suit against Kessler in the district of Indiana for infringement of the Chambers patent in making and selling his cigar lighters. The circuit court found that there was no infringement of the Chambers patent and its decision was affirmed by the Circuit Court of Appeals. There was no holding that the Chambers patent was invalid. Later Eldred brought suit in the western district of New York against one Breitweiser who was a user of the cigar lighters made by Kessler. Kessler assumed the defense of that suit. After the commencement of this last suit many of Kessler's customers refused to send in further orders and refused to pay for lighters already purchased, being intimidated by the suit against Breitweiser. Thereupon Kessler brought suit in equity, northern district of Illinois, to enjoin Eldred from commencing further suits for infringement of the Chambers patent against Kessler's customers who used the precise structure made and sold by Kessler and which had been held as between Eldred and Kessler not to infringe the Chambers patent on the ground such suits injured Kessler's business and would result in a multiplicity of actions. The circuit court dismissed the bill but on appeal to the Circuit Court of Appeals, seventh circuit, that court certified to the Supreme Court the questions: 1, did the decree of non-infringement in the suit of Eldred v. Kessler, district of Indiana, have the effect to entitle Kessler to continue to manufacture and sell the lighter complained of in that suit throughout the United States? and 2, did the decree mentioned have the effect of making suits by Eldred against Kessler's customers for alleged infringement by them of the Chambers patent in using and selling the lighter made by Kessler, a wrongful interference by Eldred with Kessler's business?

The Supreme court answered both of these questions in the affirmative. Mr. Justice Moody, in giving the opinion of the court, said, "We need not stop to consider whether the judgment in the case of Eldred v. Kessler had any other effect than to fix unalterably the rights and duties of the immediate parties to it, for the reason that only the rights and duties of those parties are necessarily in question here. It may be that the judgment in *Kessler v. Eldred* will not afford Breitweiser, a customer of Kessler, a defense to Eldred's suit against him. Upon that question we express no opinion. Neither it nor the case in which it is raised are before us. But the question here is whether by bringing a suit against one of Kessler's customers Eldred has violated the right of Kessler. * * * Leaving entirely out of view any rights which Kessler's customers have or may have, it is Kessler's right that those customers should, in respect of the articles before the court in the previous judgment, be let alone by Eldred, and it is Eldred's duty to let them alone. The judgment in the previous case fails of the full effect which the law attaches to it if this is not so." In the statement of the case the court says, "Eldred was a competitor of Kessler's and manufactured a similar form of lighter (entirely dissimilar from that described in the Chambers patent.)" It was evident to the court that Eldred's line of conduct was intended and calculated to injure and impair the trade of Kessler by driving away his

customers. The validity of the Chambers patent owned by Eldred and which he claimed Kessler infringed was not (so far as appears) in question. In any event the decree did not go against Eldred and in favor of Kessler upon any theory that the Chambers patent was invalid, but simply on the proposition that Kessler's lighter, "like Eldred's" but "entirely dissimilar from that described in the Chambers patent," did not infringe the structure covered by the Chambers patent.

It well may be that in such a suit really to enjoin an unlawful interference with a man's business by means of vexatious suits against his customers as between the parties to the prior suit the court has power to intervene and restrain the alleged wrongdoer, one of the parties to that action, at the suit of the other from bringing and prosecuting other actions involving the same precise facts and questions even though brought against other defendants and apply the rule or doctrine of comity thus giving full force and effect to the judgment of the circuit court rendered in one district in other or even all districts in the United States.

There is a wide distinction between a holding that a patent is invalid and a holding that a certain manufactured article does not infringe such patent. In *Kessler v. Eldred*, the question was not submitted and the Supreme Court did not decide that a judgment in the circuit court of one district and circuit holding a patent invalid is binding and conclusive of that fact in all other circuits even as between parties to the suit. Nor did it decide, as we have seen, that such a decree protects purchasers from the defendant in such a suit, who has successfully denied the validity of the patent, who are using and selling the alleged infringing article (made by the defendant in such suit) in other circuits against the charge of infringement made in the circuit where the alleged infringing acts are done.

If that is held it must follow that the decree of a circuit court of the United States in one circuit, as between the parties to the suit and their privies and all persons who take property from the one or the other of the parties, adjudicated upon or in relation to in such suit, is final, binding and conclusive in all other circuits as to like property thereafter made. There was no direct judgment that Kessler had the right to make the lighters in question. It was not adjudicated between Kessler and Eldred that Eldred had no valid patent. It was adjudicated that a certain structure made by Kessler did not infringe—was not covered by—Eldred's (the Chambers) patent. That adjudication was affirmed by the Circuit Court of Appeals in the seventh circuit. (*Eldred v. Kessler*, 106 Fed. R. 509.) That became the law of the case in that circuit as to that particular subject matter between these parties and their privies. The equity action was brought in the circuit court of the northern district of Illinois, also in the seventh circuit. It well may be and is probable that the opinion of the court in *Kessler v. Eldred*, supra, was given with this fact in mind. Eldred was a citizen of the northern district of Illinois and Kessler of the district of Indiana.

In the case at bar the rubber tires and rims in question here were not in existence when the case in Indiana was decided and the decree rendered which is alleged to protect the defendants here. They could not have been a subject of controversy in that suit. The validity of the Grant patent was in issue. It was adjudicated that it had no legal existence. Having no existence as to the seventh circuit, district of Indiana, the making and sale of rubber tires and rims by the Kokomo Company was not unlawful so far as the holder of that patent was concerned. I am of the opinion that this decree conferred and confers no right on the Kokomo Company to perpetually and forever infringe the Grant patent now that it has been held valid by the Supreme Court of the United States whose decision must be the supreme law of the land. Clearly, to my mind, it confers no right on the Diamond Rubber Company of New York, the petitioner for intervention here, to purchase and sell rubber tires or rims or rubber-tired wheels made by the Kokomo Company which in fact infringe the Grant patent, for as to it the Supreme Court of the United States has decided, in a case where it was sued for infringing that patent and

where its validity was directly in issue, that the patent is valid and that the Diamond Rubber Company has no right to make or sell articles covered by it. The exception in the decree of the Circuit Court of Appeals, second circuit, went to the terms and extent of the injunction to issue under it, and the effect of its decree as a whole was to reserve the question here in issue. This is held by the Supreme Court as before stated. In short, unless the decree in the circuit court of Indiana, referred to, is a protection to the Kokomo Company and all who purchase and sell tires and rims of its make wherever located and dealing in them, the Diamond Rubber Company of New York and these defendants, Seim and Reissig, are infringers when they purchase and sell and use the articles mentioned in the State of New York, especially those made or purchased and sold here since the decree of the Circuit Court of Appeals, second circuit, and its affirmation by the Supreme Court.

To hold otherwise is to fail to give full force and effect to the decision of the Supreme Court of the United States. To hold that the Diamond Rubber Company of New York, as to which company the Grant patent has been held valid in a suit wherein that company was defendant by the Supreme Court of the United States, is at liberty to purchase and sell these tires and rims throughout the United States is to say that the patent is invalid as to that company by reason of the decree of the circuit court in the district of Indiana, a subordinate court, as to all articles made and sold by the Kokomo Company in whose hands soever they go and to my mind is extending the doctrine of *Kessler v. Eldred*, supra, far beyond its legitimate scope, and the intent of the court which pronounced the judgment in that case. I do not think that either the Diamond Rubber Company of New York or these defendants is in privity with the Kokomo Company. True they purchase rubber tires and rims from the company directly or indirectly, but such tires and rims were not the subject of that action or involved in it as they were not then in existence. They were not parties to that suit in Indiana or represented by any one who was a party. They had no interest in it. The term "privity" denotes mutual or successive relationship to the same rights of property. *Litchfield v. Goodnow* (and cases cited) 123 U. S. 549, 551. It does not satisfactorily appear here that the alleged infringing wheels, or parts thereof, handled and sold by these defendants were made or sold by the Kokomo Company at any time, or prior to the decision by the Supreme Court. In fact there is stamped on the tire itself as maker thereof the name of another company. I do not think the intervention should be permitted for this additional reason, viz.—it is not made to appear that the tires and rims and wheels used and sold by these defendants were made by the Kokomo Company and there is substantial evidence that they were not made by that company. There is no suggestion that they were made by either of the other companies as to which this patent has been held invalid.

For these reasons the petition for leave to intervene is denied and the motion for a preliminary injunction is granted.

Where Government Owns All the Cars.

At present there are only six motor cars in Zanzibar, reports the American Consul at that point. Two of these are used by the Sultan, and the other four are owned by the department of public works. There are excellent roads in Zanzibar, but the foreign population, he adds, is composed largely of officials and agents of European mercantile firms whose salaries hardly warrant the purchase of motors. He suggests, however, that it may be well to send catalogs and descriptive matter to the superintendent of the department of public works at Zanzibar, and at Nairobi, British East Africa, where automobiles are bound to be more in demand in the future.

Rambler
Sixty-five

Forty-inch
Wheels

HAVE you seen that long, lithe, graceful, forty-five horsepower Rambler with the forty-inch wheels? It will be found in the hands of owners who appreciate comfort and quality without extravagance. It is the only car of Rambler quality selling in America under \$4,000, equipped with forty-inch wheels. You surely want forty-inch wheels on a seven-passenger car—they will all have them next year. Come to our salesrooms; step into this car; note the position of the adjustable steering pillar and study its many points of comfort, safety and convenience. In it you will feel that pleasing sense of exclusiveness. The public turns to look when this car goes by. The Spare Wheel relieves worry about tire trouble. The brakes are large enough to insure a feeling of security. The upholstery is that of the finest club furniture and the trimmings are of nickel.

Telephone at any time and we will bring a Rambler to your door for your inspection, or write for the Rambler Magazine.

Main Office and Factory, Kenosha, Wisconsin
Branches: Boston, Chicago, Milwaukee, Cleveland, San Francisco, New York

New York Dealers: The Rambler Automobile Co.
of New York, 38-40 West 62nd Street, New York

990,745. Automobile Tire Trunk. Isidore Sidney Kallis, New York, and Joseph Berg, Brooklyn, N. Y. Filed Oct. 1, 1910. Serial No. 584,948.

1. In combination, a trunk, a frame on the underside of the trunk, said frame comprising spaced apart side bars, said bars being bowed at their middle portion to form a space between said middle portion and the bottom of the trunk, the ends of the bowed bars being secured to the trunk, two spaced apart strips extending across the spaced apart bowed bars, said strips having upwardly extended members which engage the side of the trunk, the strips being secured to the spaced apart bars, the extended members being secured to the side of the trunk, and cushions on the bottom of the strips.

990,746. Automobile Tire Trunk. Isidore Sidney Kallis, New York, and Joseph Berg, Brooklyn, N. Y. Filed Oct. 12, 1910. Serial No. 586,662.

1. In a trunk, the combination of front and rear and side portions, the front portion comprising two end sections and a lower central section secured to the inside of the end sections, said lower central section being in a different plane than the end sections and terminating some distance below the top edge of the trunk to form an opening, a frame formed on its inner edges with a guideway and on its outer edges with a flange, the edges of the frame fitting snugly the inner edges of the end sections and the flange overlapping the said end sections and extending to the bottom of the latter, extensions formed on the bottom of the frame, the frame resting against the lower central section, and the extensions engaging the sides of the trunk and secured thereto, and a door operating in the guideway to cover the opening.

990,784. Bulb Protector. Max G. Schlottborn, Pittsburg, Pa. Filed Nov. 10, 1910. Serial No. 591,662.

1. A protector of the type described comprising sections having the upper ends thereof pivotally connected together, semi-cylindrical members carried by the lower ends of said sections, a collar mounted upon said members to retain said sections together, and said collar and members provided with means for detachably securing the collar upon the members.

990,798. Gear Casing for Driving and Steering Wheels. Jacob Berends, Englewood, Kans. Original application filed Apr. 21, 1910, Serial No. 556,742. Divided and this application filed Aug. 10, 1910. Serial No. 576,534.

The combination with a driving shaft, a wheel spindle, gears carried by said shaft and spindle, and a gear connecting said first named gears, of outer housings secured outside the first named gears, having lower portions provided with flanges and upper portions provided with curved and overlapping sides and inner upstanding flanges above the connecting gear, a flanged cap overlapping said upstanding flanges, inner housings upon the inner sides of the gears, having lower flanges secured to the lower flanges of the outer

housings, and provided with contiguous upper ends below the connecting gear, and a flanged cap secured to overlap said upper ends of said inner housings.

990,811. Distributor for Magnetos. Franklin B. Hays and John M. Dinkins, Indianapolis, Ind., assignors of fifty-three one-hundredths to William L. Taylor, Indianapolis, Ind. Original application filed Nov. 4, 1909, Serial No. 526,271. Divided and this application filed Aug. 9, 1910. Serial No. 576,410.

1. The combination, with an electric current producing apparatus, of a distributor comprising a plurality of insulated annularly arranged segment-conductors, a traveling conductor adapted to sweep all of said segments at each circuit of its travel, a driving shaft, and means between the driving shaft and traveling conductor for varying the relative travel of said shaft and conductor.

992,142. Dirigible Headlight. William B. Austin, Wilmington, Del. Filed Feb. 9, 1911. Serial No. 607,637.

In a device of the class described, a bracket adapted to be secured to an automobile, a lamp support mounted therein to rotate upon a vertical axis, a second bracket adapted to be secured to the automobile adjacent the driver's seat, a quadrant on said bracket comprising a pair of parallel members, a lever pivotally mounted on said bracket and projecting upwardly between said members, a lug on one side of said lever, one member of said quadrant being notched at substantially the center to receive said lug, a spring on the opposite side of said lever constantly engaging the other member of said quadrant, and a rod connecting said lever and said lamp support, substantially as described.

992,177. Rubber Tire. Phillip Ernerwein, New York, N. Y. Filed May 1, 1909. Serial No. 493,433.

The combination with a channel rim, of a series of elastic blocks each having a base flange projecting beyond both its ends and its sides, a pair of longitudinal side pieces for every block overlying the sides of the base and of the same length as the base, and transverse fastening bars of a width to engage the ends of two adjacent base flanges and of a length to cross the abutting ends of two pairs of side pieces, the ends of the side pieces and transverse bars being rabbeted to make a flush joint and prevent the longitudinal side pieces from creeping.

992,183. Vehicle. James Morris Foy, Palatka, Fla. Filed Jan. 12, 1910. Serial No. 537,608.

1. A vehicle, comprising a frame, wheels for supporting said frame, a prime mover carried by said frame, means for operatively connecting said prime mover and certain of said wheels, to propel the vehicle in a plurality of directions, and an auxiliary propelling device independent of said wheels, and operatively connected with said prime mover, said frame having means whereby it can be raised and lowered to render said auxiliary propelling device inoperative and operative.

992,259. Horn and Other Article Constructed from Flexible Tubing. Ernest Rubes, Brooklyn, N. Y., assignor of one-half to Louis Rubes, Brooklyn, N. Y. Filed June 15, 1908. Serial No. 438,621.

1. A wind instrument, the body of which is composed of a flexible metal tube.

992,298. Combination Convertible Vehicle Body. Willard I. Twombly, New York, N. Y., assignor, by mesne assignments, to Twombly Motors Company, New York, N. Y., a Corporation of New York. Filed March 4, 1910. Serial No. 547,207.

1. In a vehicle body, the combination with a body provided with an integral back and sides with window receiving pockets therein, and doors having a collapsible window-carrying frame, of a two-part roof, one fixed and the other part consisting of a series of hinged sections foldable upon itself and over the fixed roof; foldable roof supporting and window carrying pillars at the sides and back to fold over the top of the sides and back of the body to form a continuous and finished rail for the top of the body; drop windows carried by said pillars which may be dropped into the pockets in the back and sides; hinges to secure said pillars to the body, the hinges for the rear pillars comprising a pair of pivotally connected members, one in the form of a leaf secured to the body, the other member consisting of a sleeve portion in which the bottom of the pillar engages and is secured.

992,321. Transmission Gearing. Henry Roy Wise, Denver, Colo. Filed Apr. 5, 1909. Serial No. 488,127.

1. In a transmission gearing the combination of an operating shaft and a member to be operated, a number of annular gears surrounding the shaft and having their axes coincident therewith, a train of gears interposed between the shaft and each annular gear, one gear of each train being fast on the shaft, and another gear of each train being in mesh with its corresponding annular gear, the shafts of the interposed gears of one train being connected in operative relation with one side of the member to be operated, while the shafts of the interposed gears of the other trains are connected in operative relation with the other side of the member to be operated, and suitable means for locking any annular gear against movement during the operation of the shaft, whereby a speed is transmitted from the shaft to the member to be operated corresponding to that developed by the train of gears, substantially as described.

992,370. Liquid Measure Indicator. Iver C. Mastrup, San Rafael, Cal. Filed June 21, 1910. Serial No. 568,206.

1. An indicating device of the class described comprising the combination with a tank; of a base plate carried by the bottom of the tank, a worm shaft extended vertically through the top of the tank, said shaft being revolubly mounted upon said plate, a bearing bracket, having an apertured portion, resting upon the top of the tank, rods secured to the base plate and extended vertically at spaced distances upon diametrically opposite sides of the worm shaft, the upper ends of said rods being threaded and disposed through the top of the tank and the bearing bracket, securing nuts disposed on said rods beneath the top of the tank and upon the bearing bracket, an indicator having means operatively connected with said worm shaft and a float having a central screw threaded portion engaged with said worm shaft and slidably mounted upon said rods to rotate the shaft and operate the indicator.

992,457. Shock Absorber. Milton Tibbetts, Detroit, Mich., assignor, by mesne assignments, to Packard Motor Car Company, Detroit, Mich., a Corporation of

Michigan. Filed Nov. 19, 1908. Serial No. 463,368.

1. A shock absorber comprising two members pivoted together and adapted to move in parallel planes, a concentric arc-shaped arm extending from the edge of one of said members and having one of its faces concaved or wedge shaped tapering from the ends of the arc toward its middle, a plate on the other member between which and said other member said arm is adapted to oscillate, and springs tending to press said plate toward said member.

992,472. Motor Vehicle. Henry S. Baldwin, Hartford, Conn., assignor, by mesne assignments, to The Columbia Motor Car Company, Hartford, Conn., a Corporation of Connecticut. Filed June 22, 1899, Serial No. 721,504. Renewed Jan. 27, 1911. Serial No. 605,073.

1. In a motor vehicle, the combination with the driving wheels, driven gears and frame of the driving truck, of a casing inclosing and supporting the driving mechanism and the driving pinions in mesh with said driven gears, said casing being provided near its ends with transverse sockets affording a relatively long bearing surface, and arms entering said sockets and secured to said frame, substantially as shown and described.

992,482. Explosion Engine. Howard E. Coffin, Detroit, Mich., assignor to Chalmers-Detroit Motor Company, Detroit, Mich., a Corporation of Michigan. Filed March 1, 1909. Serial No. 480,777.

In an explosion engine, the combination with a piston, of a cylinder forming the explosion chamber, said cylinder being pro-

vided with a port and having a recess in one side thereof above the highest point of travel of the piston, an electric igniter positioned within said recess, and a cylindrical sleeve between said piston and cylinder forming a valve for controlling said port and being provided with an extension serving as a shield for covering said recess subsequent to said explosion.

992,661. Self-Propelled Vehicle. Camille Jean Hautier, Boulogne, France. Filed Oct. 25, 1909. Serial No. 524,456.

1. In a self propelled vehicle, the combination of a motor mechanism composed of an engine, a compressor and a compressed air motor, an epicycle train of gears, an externally toothed crown wheel to the said train, a toothed wheel mounted on the compressor shaft and in gear with the said externally toothed crown wheel, a propeller shaft, and means carried by the said shaft for carrying the intermediate wheels of the said epicyclic train.

992,677. Push-Rod for Delivery Valves of Internal Combustion Engines. Paul Kron, Lavallois-Perret, France. Filed Dec. 1-4, 1908. Serial No. 467,499.

1. A valve actuating rod comprising an upper and a lower member, and a casing in which the said members extend, the lower member fitting at its lower end in the lower part of said casing and having a reduced upper portion provided with a central socket, the upper member fitting at its upper end in said casing and having a reduced lower portion corresponding with the reduced portion of the lower member, the adjacent ends of said reduced portions forming co-operating contact surfaces, a central rod extending from the reduced portion of the upper member and engaging

the socket in the lower member, the reduced portions of said members forming with the casing a chamber surrounding the contact surfaces and containing oil, the oil filling the space between the contact surfaces of the members, when said contact surfaces are separated.

992,718. Transmission Gearing. Frank H. Jones, Muncie, Ind., assignor to Warner Gear Company, Muncie, Ind., a Corporation of Indiana. Filed Feb. 3, 1910. Serial No. 541,782.

1. A transmission gearing comprising a main containing casing, a pair of aligned shafts journaled therein, gears slidably mounted on one of said shafts within the casing, a gear carried by the other of said shafts within the casing, a countershaft journaled in the casing, a gear carried by said countershaft between the ends thereof and meshing with the last mentioned gear, other gears carried by the countershaft in position to receive the said sliding gears, the said casing having, at that end of the countershaft opposite the first-mentioned counter-shaft-gear, a pocket of greater diameter than the diameter of the nearest countershaft-gear, and having a depth exceeding the projection of the countershaft beyond the first-mentioned countershaft-gear, and said casing also having a bearing-receiving opening in the bottom of said pocket exceeding the diameter of the adjacent end of the countershaft, a bearing removably mounted in said opening and supporting the adjacent end of the countershaft, and means by which the shiftable gears may be shifted.

992,740. Detachable Link Chain. Arthur B. Taylor, Detroit, Mich., assignor of one-

PITTSFIELD

Jewel Mica Spark Plugs

Designed Well — Made Well

THE MICA WASHERS are compressed under great force and then machine turned to a glazed finish. The design is such that they will not soot, cannot leak and have never been known to break.

The points endure the intense heat of the magneto spark and do not carbonize like some. The spark is fat and will not miss.

half to William P. Culver, Detroit, Mich. Filed Oct. 28, 1910. Serial No. 589,630.

1. A chain comprising a multiplicity of links each comprising a pair of rigidly connected side bars, and a plurality of connecting links each consisting of a side bar, a pair of rigidly connected cross pins journaled in the adjacent ends of two of the first mentioned links and a removable side bar, the pins of each connecting link extending through and beyond the main links and the projected ends each having a transverse hole formed therethrough beyond the outer face of the removable link and a transverse notch formed in the circumference of the projected end across the transverse opening and offset relative thereto inwardly beneath the outer face of the removable link.

992,864. Cranking Device for Gas Engines. Charles R. Engel, Oaklyn, N. J. Filed Sept. 14, 1910. Serial No. 582,100.

1. In a cranking device for explosion engines, the combination with an outer clutch member secured to the engine shaft, of a sleeve journaled in fixed bearings, a crankshaft longitudinally movable through the sleeve, an expansible clutch member carried by the sleeve, means operated by

the longitudinal movement of the crank shaft for expanding and contracting the expansible member of the clutch.

992,879. Attachment for Vehicle Wheels. Howard L. Keiper and Frank W. Carlton, Easton, Pa. Filed Apr. 1, 1909. Serial No. 487,194.

A resilient wheel comprising a hub and an outer rim supported on the hub, an annular ring fitted on said inner rim and removable therefrom, a series of lugs on said ring, a cup pivoted to each lug, a cone extending from the base of each cup, a soil spring resting in said cup and centered upon said cone, a cap telescoping within said cup and over said coil spring, said cup having a compartment in its outer end, a coil spring arranged in said compartment, a cap pivoted to the outer rim and telescoping over the outer end of each cap and forming an abutment for the outermost coil spring, and a cone extending inwardly from said cap for centering said spring in said compartment.

FAL FINALLY FORCED TO THE WALL

Two Reorganizations and Changes of Presidents Fail to Save Chicago Company—Liabilities Reach \$150,000.

After long wriggling to avert it, the Fal Motor Co., of Chicago, was on Saturday last, 12th inst., petitioned into bankruptcy and now is in the hands of a receiver, Edwin C. Day having been designated by the court to serve in that capacity. The liabilities of the company are placed at \$150,000 and the assets at one-half of that sum. The petitioning creditors allege that the business and assets of the company were being "neglected and dissipated" and that there were valuable uncompleted contracts which if properly cared for would result in large profits to the company.

At least twice during the last two years, the Fal Motor Co. was on the verge of failure. On the first occasion its resources were practically exhausted and were recouped by the sale of stock in \$10 shares offered by a very florid circular which was circulated largely among farmers and which, it is said, brought in between \$60,000 and \$80,000. This money went the way of the other.

At that time, N. H. Van Sicklen, one of the veterans of the trade who is widely known in Chicago, was chosen president of the company and good use was made of his name and fame in the stock selling operations. When Van Sicklen had enough and cried quits, another reorganization was effected and E. H. Marhoefer, who was described as a banker and who also is interested in an automobile agency in Chicago, was chosen president. Marhoefer, however, failed to stem the tide and when some three weeks since E. H. Lowe, who organized the company and who since its formation six years ago had served as its secretary and general manager, resigned these offices and retired, there were those who grasped that the inevitable could not

be much longer postponed, and that the company would have to liquidate.

Consolidated "Collecting" on Grant Patent.

As a result of the decree of the United States Supreme Court in favor of the patent No. 554,675, covering the Grant solid tire, its owner, the Consolidated Rubber Tire Co., has begun the "collection" of judgments in a large number of suits for infringement which have been pending in various United States circuit courts for several years. A case of the sort against the Pennsylvania Rubber Co. of New York was decided this week in favor of the Consolidated company by Judge Holt of the United States Circuit Court for the Southern District of New York, who ruled that the defendants had infringed the patent and granted an injunction and an order for an accounting.

Pardington Goes Into Oil and Grease.

A. R. Pardington, former general manager of the Long Island Motor Speedway, who played such conspicuous parts in the promotion of the Vanderbilt cup races and other affairs of real moment, finally has gone into the trade. He is one of the organizers of the Consolidated Lubricants Co., of New York, which was this week incorporated with \$25,000, for the purpose of manufacturing and dealing in lubricating oils and greases. J. N. Patch, also of Brooklyn, and W. L. Sawyer, of South Nyack, N. Y., are the other corporators of the company.

Schacht Figures in Canadian Company.

In conjunction with several residents of Toronto, the principals of the Schacht Motor Car Co., of Cincinnati, Ohio, have formed a Canadian company and purchased a former typewriter factory in Hamilton, Ont, where Schacht cars and commercial vehicles will be reproduced. The officers of the company are: President, Thomas P. Rolph, Toronto; vice-president, T. H. Schacht, Cincinnati; treasurer, Gerard Muntz, Toronto; secretary and sales manager, J. S. Innes, Toronto.

MORGAN TRUCK IS REORGANIZED

New Corporation Headed by Unwin, Relieves Embarrassment and Resumes Work—Page's Option on Property.

By releasing several attachments and raising the sum of \$75,000, which has been secured by an issue of special preferred stock, the stockholders of the R. L. Morgan Co., Worcester, Mass., pioneer truck builders, last week saved that old company from going on the rocks and effected a reorganization under the style of the Morgan Motor Truck Co., of which Harry Unwin, of New York, one of the real veterans of the industry was elected president and general manager. The other officers are as follows: Eben F. Jones, treasurer, and Jerome R. George, Eben F. Jones, Harry Unwin, John E. Bradley and Lancaster P. Clark, Waterbury, Conn., directors. Charles H. Derby was elected clerk.

The indebtedness of \$57,000, which encumbered the R. L. Morgan Co., was taken care of by an agreement to pay 20 per cent. cash, and the giving of notes for 20 per cent., payable in two years, and for 60 per cent., payable in three years, bearing 4 per cent. interest.

The capital stock now issued totals \$719,800, of which \$144,800 is preferred, \$75,000 special preferred and \$500,000 common. The stockholders authorized the issue of \$100,000 special preferred stock, but \$25,000 was not issued. The total capital stock authorized for the company has been fixed at \$1,100,000.

Ralph L. Morgan, who formed the original company when motor trucks were curiosities and who was its treasurer and later its manager, was selected as the consulting engineer of the new organization. Of the directors of the reorganized corporation Mr. Clark is a representative of the creditors; Mr. Jones is general manager of the Morgan Spring Co.; Mr. Bradley is president of the Osgood-Bradley Car Co.; and

Mr. George is an engineer for the Morgan Construction Co.

Harry Unwin, the new president once was secretary of the National Association of Automobile Manufacturers and later was identified with the Oldsmobile and Pierce-Arrow interests in New York. During recent years he has been associated with Carl H. Page & Co., the Chalmers agents in New York, and his new position is directly due to that fact. About a year ago when an effort was being made to readjust the affairs of the R. L. Morgan Co., and when Clair Forter, of New York, became president of the company, it was current report that Carl H. Page was seeking to purchase the Morgan property. The report was circumstantially denied, but later it was announced that Page & Co. had secured the sales agency for the Morgan output. After last week's reorganization meeting, however, it came out that Page really had obtained an option on the property conditional upon his financing the company until 1912. It was stated that the option lapsed because of Page's failure to adhere to the conditions and that a few months since, while he was still advancing money, he sent Unwin to Worcester to conduct its affairs and look after his interests. While there Unwin became acquainted with the directors and stockholders and made such a favorable impression that when reorganization was effected he was selected to head the new company.

Weed Reaps Harvest of Injunctions.

Following the decision of the United States Circuit Court of Appeals for the Seventh District in favor of the Parsons patent, No. 723,299, which covers the Weed Chain Tire Grip, which decision was rendered in the suit against the Excelsior Supply Co. and the Pitts Anti-Skid Co. of Chicago, the Weed Chain Tire Grip Co. has proceeded aggressively all along the line. In the three weeks that have elapsed since the judgment was rendered, injunction orders have been obtained against The Garage Equipment Co., making the Superior grip; the Milwaukee Auto Specialty Co., makers of the Radium grip; the H. Channon Co., makers of parts for grips; Chicago Chain & Mfg. Co., makers of the Chicago grip; Leo Rabin, maker of the Reliable grip; U. T. Hungerford Brass Co. and Pearsall-Traver Co., manufacturers of the Reliance grip; William Wooster, selling the Victor grip; J. Stewart Smith, selling the Morgan and Whittaker grips; The 35 % Automobile Supply Co. and A. B. Norwalk, selling the Cleveland, Wearwell and other grips. Three other manufacturers of grips have consented to injunction orders which are before the court for signature. They are the Enterprise Chain Co., makers of the Morgan grip; Cleveland Chain & Mfg. Co., makers of the Wearwell and Economy grips; Newall Chain, Forge & Iron Co., manufacturers of the Presto and Ever-Ready grips.

RUSSIA MAY PURCHASE 2000 TRUCKS

Government Investigating and Testing Many Vehicles for Army Use—Opportunity for American Makers.

In common with the military authorities of France and Germany, the Russian War Department is making extensive preparations for equipping the army with motor trucks. According to United States Consul Jacob E. Conner, of St. Petersburg, a large area is being cleared in that city on which repair shops are being erected, while garages are to be installed in various parts of the Empire. It has been learned from official sources that the purchase of 2,000 trucks of capacities ranging from 1½ to 3 tons is contemplated. Arrangements have been made for funds to cover initial expenses, so that cash payments will be made for trucks purchased for trial purposes. About 25 European machines have been obtained thus far under the arrangement in question, but no American products.

The consul states that American trucks sent to St. Petersburg would be practically certain to be purchased for experimental purposes and suggests that manufacturers should lose no time in placing a machine at the disposal of the government. On application to the Bureau of Manufactures, Department of Commerce and Labor, at Washington, with reference to File No. 7,143, applicants will be supplied with the name of a party who guarantees that any American car intrusted to him will be submitted for trial. A series of tests began last June, but the authorities have consented to give a trial to any American car entered properly. The majority of cars are to be used for hauling bulky army supplies such as provender and camp equipment.

Sampson Forms a Trucking Company.

As a solution of the much-vexed commercial vehicle demonstration problem, the metropolitan branch of the Alden Sampson Mfg. Co.—which is a part of the United States Motor Co.—has evolved the plan of employing a separate organization to handle all the operating work that usually is carried on directly by a sales organization.

With this object the Sampson Motor Trucking Co. has been formed, which is, strictly speaking, a company within a company, in the sense that it is not to have a corporate existence and that it will not seek business nor attempt to find a market for its services. Its purpose will be to take care of whatever demonstrations may be required by prospective purchasers, subject to the direction of the parent selling company, to provide substitute vehicles for Sampson truck owners whose equipment may be temporarily disabled and also to assist customers by furnishing extra trucks

for emergency duty. The keynote of the plan is that by making the demonstrating department in a sense a separate organization, dependent for its existence on the successful performance of trucking operations, it will be possible largely to reduce the cost of demonstrations, if not to eliminate it altogether.

The services of the new trucking company will not be gratuitous; either the party for whom service is performed or the sales department will be forced to pay for all haulage performed. Incidentally the plan is expected to furnish useful information as to local haulage costs. The new company commenced operations this week with an equipment of six trucks.

Advises a Receiver for Maytag-Mason.

William Galloway, of Waterloo, Iowa, who was reported to be one of the largest indorsers of the paper of the Maytag-Mason Motor Co., of that city, has issued an unqualified denial of the statement. He states that neither he nor a company bearing his name has signed even a dollar's worth of such notes, and adds that he has nothing to do with the management of the Maytag-Mason establishment; a year ago he had an option on it which he did not exercise.

The affairs of the company are in bad shape, however, and to conserve the interests of all, the creditors' committee which has conducted an investigation, has recommended that a receiver be appointed; the necessary legal application will be made before the close of the present week.

Ford Branch Occupies Service Building.

The Ford Motor Co.'s New York staff last week took possession of the handsome three-story service building which the company recently erected at Jackson avenue and Honeywell street, in Long Island City. A retail salesroom will be continued at the old address in New York City, 1723 Broadway, but the offices, stockroom and repair department henceforth will be located in Long Island City.

Purchasing Agents to Produce Trucks.

Benjamin Rosenzweig, purchasing agent for the Buick Motor Co., and Patrick R. Doherty, who served the W. A. Paterson Co., of Flint, Mich., in a similar capacity, have resigned their positions and are organizing a company which will manufacture trucks in either Detroit or Jackson, Mich. E. J. Copeland has succeeded to the vacant berth in the Buick establishment.

Metzger to Triple Size of Factory.

The Metzger Motor Car Co. has let contracts for the erection of two additions to its plant in Detroit, which will triple its capacity. The larger of the two buildings will be a four-story structure 550 x 68 feet, which will be completed within 90 days; the other will be a one-story heat-treating shop 150 x 35 feet.

MILES GETS CONTROL OF PALACE

Heads New Company Which Obtains Lease of New York's Show Building—The Others in the Enterprise.

It developed early this week that in addition to securing the new Grand Central Palace in New York for the "open" show which will be held in January next by the National Association of Automobile Manufacturers, Samuel A. Miles, general manager of that organization, had gone further and associated with several other men who have been identified with exhibitions of various sorts, has formed a company which has leased the Palace and which, therefore, will be in position to control all shows and other displays which may be held in that superb new building.

This new company is styled the International Exposition Co. and Miles is its president. The other officers are as follows: Vice-President, Richard G. Hollaman; secretary and treasurer; James C. Young; managing director, Capt. J. A. H. Dressel. Directors—Edward V. P. Ritter, Charles E. Spratt, Samuel A. Miles, James C. Young, Richard G. Hollaman and J. A. H. Dressel.

Mr. Young only recently resigned as secretary-treasurer and manager of the Madison Square Garden Co. to assume similar duties for the owners of the Grand Central Palace, which will fall heir to practically all of the shows which hitherto have been held in Madison Square Garden, the demolition of which will begin on February 5th next. Capt. Dressel, who will become managing director of the International Exposition Co., fathered several sportsmen's and other shows which have been held in New York and elsewhere and latterly has been connected with the Madison Square Garden management. Richard G. Hollaman, another director, is the owner of the Eden Musee.

Akron Man Gets Patent No. 1,000,000.

Francis H. Holton, of Akron, Ohio, has the distinction of being the owner of United States Patent No. 1,000,000, which was issued to him on August 8th, and which is of interest to the automobile industry in that it applies to a rubber tire. While designated as the one-millionth patent, it is actually No. 1,009,957, as patents granted between 1790 and 1836 (prior to the establishment of the present bureau, in 1836) were issued by the Department of State and were not numbered. Holton's patent was filed April 25, 1910, and bears Serial number 557,336. The inventor's claim, as expressed in the patent, is as follows:

"In vehicle tires, a tire having a core of relatively solid material substantially half-round in cross-section and provided with

an outer portion adhered thereto and consisting of a series of flexible strips of substantially V shape in plan and of substantially half-round shape in face elevation and overlapping successively at their sides, whereby several of said strips are brought into the immediate tread at the same time to carry the load."

Alleged Defects Lead to Large Suit.

Alleging that its business reputation has been damaged to the extent of \$35,000 and claiming \$4,392.17 for breach of contract, the Easton Machine Co., of South Easton, Mass., has brought suit in the Bristol County (Mass.) Superior Court against the Providence Engineering Co., of Providence, R. I., for the recovery of those sums. The Easton company manufactures automobiles and states that it contracted with the Providence concern to produce certain castings, which proved defective, and for which the defendants refused to give credit in accordance with the terms of the contract. On this count, the plaintiffs claim \$4,392.17, and because of orders lost and damage done to its business reputation by the alleged defective castings, the other \$35,000 is sued for. The defendants have entered a general denial and retort that the work was performed under the inspection of plaintiff's representative.

Two Americans to Exhibit in Germany.

Among the exhibitors who have contracted for space at the forthcoming international automobile exposition at Berlin, Germany, October 12-22, are two American manufacturers, the Buick Motor Co., of Flint, Mich., and the Ford Motor Co., of Detroit. Sixty-five manufacturers of complete cars so far have been entered, including one English firm (Daimler), two Swiss, one Italian, two Austrian, one Belgian and nine French makers. One hundred and forty-four exhibitors of accessories have reserved spaces for the display of their wares.

Federal Locates Branch in Chicago.

The Federal Rubber Mfg. Co., of Milwaukee, has established a branch in Chicago, at 1434 Michigan avenue, in charge of George W. Stephens, formerly of the American Tire & Rubber Co., and at one time connected with the G & J Tire Co., as were most of the officials of the Federal company. The Chicago house will handle all of the states of Illinois and Iowa and the northern part of Indiana.

To Develop Parkhurst's Casting Process.

To operate a casting process patented by L. M. Parkhurst, which obviates sand moulding, the Indiana Die Casting Development Co. has been organized in Indianapolis, with \$100,000 capital. E. E. Gates, J. L. Baker and W. P. Herod are the directors of the company, which is seeking a factory site.

BRISCOE SEES 210,000 CARS AHEAD

Predicts That Output and Sales During 1912 Will Be Greatest Ever—Conditions Reported at Conference.

"After careful consideration of the reports we have received from various parts of the country, and as a result of discussions with our branch managers, I am convinced that 1912 will see more motor cars built and sold than ever before in the history of the industry; I believe the output will not fall short of 210,000 cars, in which estimate I do not include trucks or other forms of freight-hauling vehicle."

This is the forecast made by Benjamin Briscoe, president of the United States Motor Co., following a series of conferences with the managers of the big company's branches, the first of which occurred in Atlantic City, and the others, in order, in Detroit, Chicago and Kansas City, the latter of which was attended by the managers from the Pacific Coast. In addition to Mr. Briscoe, the headquarters' officials who were party to the conferences were Horace DeLisser, vice-president; Alfred Reeves, general sales manager; F. E. Dayton, sales manager for Columbia cars; D. C. Fenner, sales manager for Sampson trucks; J. A. Bell, of the Maxwell division, and Ernest Coler of the Car Owners Department.

"The biggest year of the industry up to this time was 186,000 cars, at an average retail price of \$1,533, but 1912 will see not less than 210,000 pleasure cars at an average price of about \$1,100, which indicates a greatly increased number of cars selling at \$1,000 or less, with a substantial increase in the high priced cars," says Mr. Briscoe in amplifying his forecast. "Of this number, I believe at least 60 per cent. will be used by physicians, contractors, salesmen, and others for utility purposes, for the need of a motor car in almost every grade of business life now is apparent.

"Of this big production of motor cars," continued Mr. Briscoe, "the major portion will be made by a comparatively small number of big producers, while the cars that will sell best are certain to be those of reputation that supply ample power and modern style at low prices.

"At our several conferences we had a thorough discussion of trade conditions, and the main impression I gained was the fact that the automobile business now is down to a basis of stability that averages up with any other business dealing in staple articles. We will have types and styles as in any other manufacturing commodity. Reports from our 1,800 dealers in the various towns and cities indicate an active and steady call for our products, the same as there is for other manufactured articles, and also foreshadow a demand greater than

ever before. In no previous year at this time have we had so many orders on our books for immediate delivery.

"That the farmer is growing more and more a factor in our prosperity, is amply proven by reports from the farming districts. We find that the cotton crop in the South this year will be one of the greatest in history, and while in some places crop reports are unfavorable, I am convinced that the general prosperity of the farmers will not be affected to any great degree. Crops in the Dakotas are bad, because of the dry weather, and similar conditions, in a lesser degree, exist in Kansas, Nebraska, Oklahoma and parts of Texas. But the farmers are buying cars and will continue to buy them in greater quantities than ever before, because their use is profitable and they make for better living conditions in the agricultural districts."

Changes Among Prominent Tradesmen.

H. L. Winter has been appointed sales manager of the Federal Motor Truck Co., of Detroit. Previously he was connected with the E. R. Thomas Motor Car Co., of Buffalo.

Fred E. Tucker, formerly with the Pope-Hartford agency in Boston, and later connected with J. H. MacAlman, has become manager of the Pope-Hartford Auto Co., of New York.

J. K. Jamison, assistant sales manager of the Michelin Tire Co., has resigned that position to become identified with the Willys-Overland Co. in Toledo; he will fill a berth in the sales department.

Fred W. Warner has been appointed manager of the Buick Motor Co.'s Chicago branch. Previously and for many years he was engaged in the agricultural implement trade in Dallas, Tex., and other sections of the southwest.

H. E. Shiland has been made sales manager of the Westcott Motor Car Co., of Richmond; Ind. Formerly he was in charge of the sales department of the Buick Motor Co., of Flint, Mich., and was one of the best known men in the trade.

Simon Davis, who for the past five years has represented the Diamond Rubber Co. in Ohio and Indiana, has engaged with the Consolidated Rubber Tire Co., which he will represent in the same territory. He will be attached to the Cleveland branch of which Otis R. Cook is manager.

Norman E. Oliver, manager of the Diamond Rubber Co.'s Buffalo branch, has been designated to succeed Harvey J. Woodard as manager of the Diamond Rubber Co. of New York, Woodard having become general manager of the Century Tire Co. Oliver will make his headquarters in New York City but will remain in charge of the Buffalo establishment also, his authority having been enlarged to include all of the territory east of Buffalo.

Higginsville, Mo.—Auto Livery Co., under Missouri laws, with \$2,500 capital; to maintain an automobile livery service. Corporators—J. S. Santemeyer, E. B. Gladish, S. H. Gladish.

Akron, Ohio—Akron Automobile Club, under Ohio laws, with \$10,000 capital. Corporators—T. L. Lamson, Guy E. Norwood, L. D. Brown, J. B. Campbell, B. A. Polsky, George G. Allen.

Chicago, Ill.—Coey-Ott Livery Co., under Illinois laws, with \$2,000 capital; to operate an automobile livery service. Corporators—Charles A. Coey, Monroe E. Mitchell, Andrew Ott.

Toledo, Ohio—The Parsons Garage and Repair Co., under Ohio laws, with \$10,000 capital; to maintain a garage and do general automobile repairing. Corporators—C. W. Parsons and others.

Natchez, Miss.—Natchez Auto and Supply Co., under Mississippi laws, with \$10,000 capital; to deal in automobiles and accessories. Corporators—S. B. McNeely, C. L. Richardson and others.

Indianapolis, Ind.—Morton Place Automobile Co., under Indiana laws, with \$10,000 capital; to deal in automobiles and accessories. Corporators—Mabelle E. Hutchinson, I. A. Pease, Mary Cheney.

Detroit, Mich.—Cleimat Motor Parts Co., under Michigan laws, with \$50,000 capital; to manufacture and deal in automobile parts. Corporators—Harry E. Walder, Graham Duffield, Henry B. Baxter.

Seattle, Wash.—National Auto Tire Filler Co., under Washington laws, with \$10,000 capital; to manufacture and deal in automobile and other tires. Corporators—John Cort, J. B. Lewis, D. S. Updegraff.

Rock Hill, S. C.—Jones Motor Co., under South Carolina laws, with \$15,000 capital; to deal in automobiles and other motor vehicles. Corporators—W. G. Stevens, E. G. Jones, R. M. London, all of Rock Hill.

Bellingham, Wash.—Coast Auto and Realty Co., under Washington laws, with \$6,000 capital; to deal in automobiles and real estate and maintain a garage. Corporators—L. E. Wattam, E. Peterson, Charles Peterson.

Schenectady, N. Y.—Union Lubricating Co., under New York laws, with \$25,000 capital; to manufacture and deal in lubricating and other oils. Corporators—J. W. Nagle, E. T. Robinson, M. C. Cahill, all of Schenectady.

Boston, Mass.—Raymond Engineering Co., under Massachusetts laws, with \$150,000 capital; to manufacture machinery for all purposes. Corporators—President, M.

F. Hubbard, Taunton; treasurer, J. A. Haley; E. Baintree.

Akron, Ohio—Akron Automobile Club Co., under Ohio laws, with \$10,000 capital; to maintain an automobile club. Corporators—T. L. Lamson, Guy E. Norwood, L. D. Brown, J. B. Campbell, B. A. Polsky, George C. Allen.

Chattanooga, Tenn.—Meridian Auto School and Garage, under Tennessee laws, with \$1,500 capital, to maintain an automobile school and conduct a garage. Corporators—R. E. Stone, J. M. McBeath, C. H. Barr and others.

Chicago, Ill.—Goetz Auto Radiator Co., under Illinois laws, with \$2,500 capital; to manufacture automobile and other radiators and conduct general mercantile business. Corporators—Albert Goetz, Charles F. Lowy, Peter Sissman.

Yonkers, N. Y.—Hudson Valley Automobile Co., under New York laws, with \$10,000 capital; to deal in automobiles and operate a garage. Corporators—Harry L. Twine, A. M. Keene, of Yonkers; George Eickemeyer, of New York City.

Evansville, Ind.—Eclipse Clutch Manufacturing Co., under Indiana laws, with \$100,000; to manufacture and deal in automobile parts. Corporators—E. C. Altenberg, J. W. Ford, J. L. Scheuble, J. G. Beckman, A. L. Swanson.

Lynn, Mass.—Wyeth Motor Car Co., under Maine laws, with \$600,000 capital; to manufacture, build and sell automobiles and motor vehicles. Corporators—President, C. E. Clemence, Lynn, Mass.; treasurer, E. Perry, Portland, Maine.

Newark, N. J.—Ignition Manufacturing Co., under New Jersey laws, with \$100,000 capital; to manufacture automobiles, motor vehicles and automobile and motor supplies. Corporators—P. G. Roder, A. Markowsky, W. L. Roder, all of Newark.

New York City, N. Y.—Consolidated Lubricants Co., under New York laws, with \$25,000 capital; to manufacture and deal in lubricating oils and greases. Corporators—A. R. Pardington, Smithtown, L. I.; W. L. Sawyer, South Nyack, N. Y.; J. N. Patch, Brooklyn, N. Y.

Trenton, N. J.—Auto & Marine Specialty Co., under New Jersey laws, with \$50,000 capital; to manufacture the Williams safety automobile crank and other specialties and novelties. Corporators—C. T. Williams, Jr., H. S. Maddock, Jr., F. D. Holmes, C. C. Thompson, T. H. Bissell, all of Trenton, N. J.

Increase of Capital.

Hartford, Conn.—Miner Garage Co., from \$20,000 to \$35,000.

Change of Name.

Louisville, Ky.—Marshall-Clark Motor Car Co. changes name to Clark Motor Car Co.

A \$20,000 garage is being built at Catskill, N. Y., by Amos Post.

Hal Bailey has opened a garage and salesroom in Galva, Ill. He will handle Everitt cars.

Glen Fisk and Carl Bundy, of Sheldon, Ill., have formed a partnership and opened a garage in Kentland, Ind.

C. J. Maxim has established a salesroom at 1380 Bedford avenue, Brooklyn, N. Y. He will handle the Reo and Brenner cars.

Allan Redmond and Irvine Huehner have opened a garage in Eau Claire, Wis. They will do a renting business as well as general repairing.

Matthew Nelson has purchased the garage and repair shop of F. R. Wells, in Marshall, Mich. He will continue it under his own name.

Joe Regan is building a one-story brick garage in Los Angeles, Cal. It is located at the corner of Pico and Los Angeles streets, and will be 63 x 75 feet.

Three business men of Galena, Ill., have opened a garage and machine shop in their home town. They are Alfred Gray, Gus Stephens and Henry Everett.

Gillett & Krueger is the style of a new firm which has opened a garage in Hutchinson, Kan. General repairing and a rental service are to be conducted.

A. Vandrimmelen and J. L. Goff, of Knoxville, Ia., have formed a partnership under the style of Central Auto & Machine Co. They will handle Carter cars.

J. D. Foose, of Ottawa, Kan., has purchased the business of the Ottawa Motor Car Co. He will do business under the style the Foose Garage & Auto Repair Co.

The Weeber Mfg. Works, of Albany, N. Y., have gone into the motor truck business. They will handle the Mais truck in Albany, Schenectady and Rensselaer counties.

Robert S. Hepburn has opened a garage and repair shop at 16 Woodworth avenue, Yonkers, N. Y. He will do business under the style of the Hudson Auto Machine Works.

T. Sherow thinks Millbrook, N. Y., has been without a garage long enough, and he intends to supply the deficiency. He is remodeling the Jaeger building for that purpose.

The Bloomdale Garage, which was opened a year ago by C. E. Baker & Son in the Ohio town of that name, has been discontinued on account of insufficient business.

The Franklin Garage, at Dover, N. H., which was under the management of W. Scott Spaulding, has changed hands. Herbert Goddard, formerly of Athol, Mass., has purchased it.

Alexander Wilson has taken out a permit for a brick garage at the corner of Grand Concourse and 182nd street, New York City. The structure will cost, when complete, \$28,000.

Hugh Hinds, part owner of the Court Motor Car Co., of Marietta, Ohio, has disposed of his interest to T. L. Riddle. He contemplates opening a larger garage at Indianapolis, Ind.

Johnstown (Pa.) shortly will boast of another big garage "in its midst." The Swank Hardware Co., which handles the Buick line, is building it at the corner of Bedford and Adam streets.

Carroll & O'Brien is the style of a new automobile firm which has leased a two-story building at Waterbury, Conn., which will be ready for occupancy by October 1. It will be 50 x 122 feet.

Lewis F. Hewlett has opened a salesroom at 1392 Bedford avenue, Brooklyn, under the style the Otto Motor Car Sales Co. As the name indicates, the company will feature the Otto car.

Under the style the King Motor Car Co., a new company has been formed at St. Louis, Mo., with E. C. Bartholomew as the moving spirit. As the name indicates, King cars will be dealt in exclusively.

L. A. Ross, who operated a garage at Fennimore, Ia., has sold his business to Everett McReynolds of the same place. Ross, however, still retains his garage at Mineral Point, in the same state.

F. K. Barner, of Hopkinton, Ia., has rented the I. T. Wilson agricultural implement building and will install a garage and salesroom therein. He will also carry a complete stock of accessories and supplies.

The Barrett Motorcar Co. is the style of a new concern which just has opened salesrooms at 906 Main street, Buffalo, N. Y. Frank Barrett is manager of the company, which will deal in Hudson cars exclusively.

T. E. Westbrook has been appointed receiver for the Consolidated Motor Car Co. of Atlanta, Ga., against which involuntary proceedings in bankruptcy were instituted recently. His bond has been fixed at \$900.

Martin Sauer has commenced work on what is claimed will be the largest garage in the state of Iowa, on Main street, Ida Grove. It will be of concrete, absolutely

fireproof, 55 x 102 feet, with full plate-glass front.

At a cost of \$35,000 a new garage is being erected at the southeast corner of Broadway and Thirteenth avenue, Denver, Colo. It will be two stories high, of fireproof construction, and will be managed by Tom Botterfill.

The Ford Auto & Machine Co., of Mexico, Mo., has filed notice of a change of name to Meyers Automobile Co. The company operates a taxicab service, deals in Ford cars, and in supplies, and is in charge of W. T. Swinney.

The Overland Automobile Co. of St. Louis, which was incorporated last week at St. Louis, Mo., has opened salesrooms at 3210 Locust street. H. D. Condie, T. L. Hausmann and C. P. Eberle are the men behind the enterprise.

The Pioneer Motor Car Co., Baum street, Pittsburg, Pa., has been reorganized. The new associates of the company, together with I. G. Davis, who retains the secretary-treasurership, are J. F. Esperon, George H. Hopkins, and James Iams.

The Bruce-Cubbins Automobile Co., of Memphis, Tenn., has removed its headquarters from 237 to 244 Monroe avenue, and changed its manager. George S. Danaher, of Little Rock, Ark., hereafter will direct the business of the company.

The Parsons Garage & Repair Co., which was incorporated last week at Toledo, Ohio, with \$10,000 capital, has opened headquarters at Jefferson avenue and Michigan street. C. W. Parsons is president and F. J. Lehmann general manager.

Maurer & Hartman, Freeport, Ill., have found their quarters at 88 Exchange street too small, and moved to 51 Exchange street. Simultaneously they have added Chalmers cars to the Olds, Hudson and Packard lines, which they have handled for some time.

The firm of Seabury Brothers, dealers in agricultural implements at Logan, Ia., have added automobile repair work to their other activities, and opened a garage and repair shop in Missouri Valley, the same state. The building is 50 x 150 feet, of cement block construction.

The Wright Brothers—not the aviation experts, but the automobile and agricultural implement dealers of that name in Carrollton, Mo.—are building a new structure in which to house their increasing business. The new garage is 50 x 100, with granitoid floor and clear of posts, and will afford room for at least 30 cars.

The HAYNES 1912

Model 21, 5 passenger, 40 H. P.,
\$2,100. F. O. B. Factory

The eighteenth year of Haynes automobiles is a year of triumph for the pioneer American manufacturer of motor cars.

THE 1912 HAYNES is bigger in every way, and more powerful, than the splendid Haynes models of 1911, and is distinguished by many refinements of style. The time-tested, sweet-running Haynes motor is built with greater stroke and bore. The wheel base has been lengthened. The brakes are larger (1 sq. in. of braking surface to every 13 lbs. of car.) The equipment is complete and of the very highest class. All the models are designed to accommodate dynamo electric lighting. And the

Haynes contracting band clutch is still the most compelling single feature in any American built car.

The Haynes gives everything desirable in an automobile and at a price from one to two thousand dollars less than charged for cars of like character, and only a few hundred dollars more than buyers are asked to pay for "low-priced" cars. Because it is supreme in its field, the Haynes—throughout those trying months following the fire which destroyed our former factory last February—held its agents from coast to coast, in the face of the

most active competition. The judgment of these loyal Haynes agents has been more than justified by the superb Haynes of 1912 and the complete line of models now being manufactured in our great new plant.

The attitude of present Haynes dealers should suggest something to other dealers who may be in a position to take on a high grade line. For several such desirable dealers we have an unusually attractive proposition. If you are interested, please address

HAYNES AUTOMOBILE COMPANY, Dept. U, Kokomo, Ind.

SPECIFICATIONS HAYNES MODEL 21

Motor. 4½ inch bore, 5½ inch stroke, T-head Haynes type cylinders cast in pairs, offset ½ in. Flexible four point suspension.

Wheel Base. 120 inches.

Ignition. Eismann dual magneto, with dry cells for starting.

Carburetor. Stromberg 1½ in., Model B.

Lubrication. Splash and force feed, oil reservoir in lower half of crank case and filled through bleeder pipe in center of crank-case.

Steering Column. Worm-and-gear type. Timken roller bearings on shaft, corrugated hard black rubber rim, aluminum spider, 18-in. wheel.

Clutch. Haynes contracting steel band on bronze drum. Supported by crank shaft. Easily adjusted and lubricated.

Transmission. Selective type, three speeds forward, one reverse. Timken roller bearings.

Rear Axle. Timken full floating type, pressed steel housing supporting full weight of car.

Shaft, nickel steel.

Front Axle. Single piece I-beam 2 inch, drop forged. Spring seat forged integral. Spindles

5-16 inch diameter. Timken roller bearings.

Wheels. Artillery type wood, twelve spokes front and rear. Boss spokes alternating in rear wheels.

Tires. 36 x 4 inch, front and rear. Demountable rims.

Springs. Front, semi-elliptic; 40 inches long, 2 inches wide, 7 leaves; rear, 41½ inches long, 2 inches wide, 6 leaves. Fitted with grease cup, both front and rear.

Brakes. Internal and external on rear wheels.

Drum 14 x 2½ face.

Colors. Body black, 18 coats of paint, all hand rubbed. Wheels black same as body.

All metal equipment, gun metal, black enamel and nickel.

Equipment. Eismann dual magneto, Stromberg Model B Carburetor, silk mohair top, wind shield, Prest-O-Lite tank, five lamps, Warner 60-mile dial Speedometer, extra Dorian Remountable Rim, Tanner automatic gasoline gauge.

Model 21 is built with following bodies: Touring; Close-Couple 4-passenger; Colonial Coupe, \$2,450; Limousine, \$2,750.

Model Y, 50-60 H. P., 7-passenger, is built in touring and fore-door limousine.

NEW YORK, AUGUST 17, 1911.

Overcrowding the Chauffeur's Field.

That there is merit in the charge that not a few of the evils attributed to the chauffeur's profession are due directly and indirectly to the superabundance of so-called "automobile schools" does not admit of much dispute. No town of any pretensions appears too poor to maintain at least one school of the sort while the larger cities are overburdened with them.

While such institutions may have started some young men on the road to greater things, it is safe to say they have started more of them on a long, fruitless search for employment in a field that has become congested to the bursting point and in which wages, due to the contracted and contracting demand and the over-abundant supply, have been forced down to figures that hold small attraction and smaller promise for the ambitious man. To employ expressive vernacular, "the woods are full" of unemployed chauffeurs. They are of all

ages, sorts and conditions. The public records prove that while the use of motor cars has steadily increased, the number of professional drivers who have found employment and who have found it worth while to renew their licenses has steadily diminished. Due to the "schools," the profession is streaked in all directions with mediocrity—with men who know how to turn a steering wheel and handle a lever and little else. How can it be otherwise when "schools" undertake and profess to impart the knowledge and skill of a machinist in a course of lessons occupying four or six weeks? While the simile may be overdrawn, it is almost as easily possible to imagine doctors or veterinary surgeons being turned out in three months' time.

The "auto schools" have much to answer for. Probably their lure of pleasant work for pleasing pay never will wholly lose its attraction, but to young men who want to become chauffeurs via the six weeks "diploma" route—or by almost any other route, at this time, at least—the best advice that can be given is contained in the little word "Don't." It is the exception and not the rule when disappointment does not await them.

The "Transient" and the Garageman.

Of course, tourists of whatever sort usually are considered "fair game" by most of those with whom they come into contact during the course of their travels, and it is greatly to be feared that there are garagemen who have brought themselves to such a frame of mind that they must be included in that category. While there are those who are given to making large charges for small services in the matter of repairs or adjustments, the garagemen's opportunities are not nearly so great as are the chances of those who "entertain" tourists for more or less extended periods of time.

The average "transient," is housed in a garage for one night only and is seen no more for weeks or months or possibly never again and apparently there are garagemen who make the most of the fact and the sad part of it is that in seeking to make the most of the "transient," petty methods so often are employed. Usually he is charged two if not three or four times the prices exacted from regular customers for storage and service, which would not be quite so bad if first class service were rendered. But it is a by no means infre-

quent complaint that the washing and polishing of the "transient" car is most slovenly performed. Instances are known when the washing consisted merely of wiping off the dust and dirt and the polishing of the brasses comprised little more than the proverbial "lick and promise."

The tourist's complaint rarely serves any purpose. He must be on his way at about the time he pays his bill and if he complains at all, the overshrewd garageman, with his tongue in his cheek, has ready a mouthful of regrets or apologies, occasionally coupled with a smirking threat to discharge the workman guilty of the slovenly work. But there is no record that any garageman ever offered a rebate for service only half performed.

There should be an end to this sort of thing. Not all garagemen are guilty of it, but their number is sufficiently large. To view the tourist and the transient as a "good thing," and to treat him accordingly, is not always a safe proceeding. It has been the means of undoing many hotels and resorts and it can be made the means of undoing overshrewd garagemen who incline to such treatment. Word of mouth advertising is valuable advertising and the tourist performs a lot of it. But when a garage is advertised as "a good place to stay away from," as we have heard some of them referred to by tourists, it is likely to prove more effective and far-reaching than the owners of such places are likely to imagine is the case.

Fusible Plugs for Fuel Tanks.

One of the stumbling blocks encountered by the worthy Municipal Explosives Commission of New York City in its recent and unlamented attempt to establish a new set of garage regulations was Sec. 52. Section 52 it was which provided that no motor vehicle should be stored or kept in a garage unless its tank be fitted with a safety or fusible plug for which a certificate of approval had been issued by the fire commissioner. Inasmuch as up to the moment of the public hearing probably none of those present had ever so much as seen a fusible plug of the sort described and inasmuch as the adoption or non-adoption of such a device must of necessity be a matter beyond the control of the local garageman, it was but natural that representatives of various garage and repair shop enterprises and in particular those of the Automobile Club of America, which operates the biggest garage

of all, should crowd one another rudely in their efforts to gain the floor and voice a protest.

All the same a word should be said in favor of the fusible plug as a device for the protection of automobiles and particularly automobile garages when subjected to the fire risk. For it is one of those devices which, in principle looks as good as it really is, but which the average man would require to have explained several times before he became convinced of its real utility. Furthermore, it is not a fit subject for municipal enactment for the simple reason that the education of the average motorist has not progressed to a point where he is likely to appreciate its advantages. Nevertheless, under ordinary conditions fusible plugs should, and undoubtedly would, prove of unquestionable merit in reducing the actual loss from fire.

The principle of the thing, in a word, is nothing more or less than the introduction of a safety valve in the gasoline tank to perform the function of any ordinary safety valve, namely that of preventing the bursting of the tank from excessive internal pressure. Its effect would be to eliminate the danger of an explosion due to the burning of a car or to the burning of the building in which a car was stored; in a measure it would serve to localize the risk of fire in and about all gasoline cars, thereby robbing fires involving them of much of their real and fancied danger.

Under ordinary circumstances, the heating of the contents of a gasoline tank frequently results in the generation of vapor to a point where a bursting point is reached, when the metal yields, very often at a seam, releasing to the surroundings a mass of explosive mixture, vapor and liquid fuel mixed. The result is sufficiently unpleasant to have given the automobile a bad name among professional fire fighters.

The remedy lies in the simple expedient of preventing the explosion by releasing the contents of the tank before the bursting pressure is reached and in confining its exit to as restricted an area as possible. So released the fuel would be burned and still would generate a tremendous amount of heat, but restricted and burning normally, rather than explosively, the risk of spreading the flames or of actual damage from concussion would be practically wiped out.

Mechanically the fusible plug offers no very serious obstacle to the trained engi-

neer. A suitable cup secured to an opening in the tank, screens to prevent back-firing, a pipe to direct the outflow of gas in a downward direction toward the rear of the machine, and a renewable breaking plate or plug of a tensile strength safely below that of the metal tank—a few simple parts and an attachment that will permit the renewal of the plug are all that is required. Nor would the expense incident to

is adoption be serious. All that remains is for the manufacturer to appreciate that by the use of a device of the sort a few motorists, who will never learn to be careful about lamps and carburettors too close together, might be saved the entire loss of their cars in consequence of the blowing up of the tanks, while garage fires would lose many of their terrors and much of their real menace to life and property.

GLIDDEN WILL BE TEAM CONTEST

New Plan to be Tried on Tour to Jacksonville—"Cash or Plate" Now Offered to Contenders.

The resurrected Glidden tour, otherwise known as the Eighth National Reliability tour of the American Automobile Association, will be started from New York on October 14. That has been definitely decided, and a number of other points, more or less vague, are cleared up by the entry blanks, which just have been issued.

As was stated previously in the Motor World, the tour will go South instead of North, and Jacksonville, Fla., will be the objective point, 10 running days being required to make the journey, which approximates 1,369 miles. According to the tentative schedule which has been laid out, 90 miles will be covered on the first day, 116 on the second, 184 on the third, 148 on the fourth, 145 on the fifth, 156 on the sixth and 138 on the seventh days. Saturday and Sunday, which are the eighth and ninth days, will be spent in resting, and on the tenth day the tour will be continued with a run of 100 miles; 150 miles will be covered on the eleventh day, and 142 miles on the twelfth and last day will land the motorists in Jacksonville on Friday evening, October 25th.

Though the designation of the tour as a Grade IV contest, which means that penalties will be charged for lateness at control only, so changed it as to make it scarcely recognizable, another change of equal importance, and one which still further changes its semblance to the original Gliddens, is that the tour will be a "team" contest. Which is to say that the Glidden trophy will not be awarded to an individual but will be given to a team of three from the same city or town. Each of the teams may be composed of either touring cars or runabouts, or a combination of both, and is designated by the name of the city or town from which the contestants enter, the trophy going to the team which has the least number of points penalty at the end of the tour. If more than one team is entered from one city or town the first will be designated "Team No. 1," and though any entrant has the option of selecting the team in which he will compete, he must select a team from his own state.

In the case of a tie between two or more of the teams, the cars in each team will be examined by the Technical Committee of the A. A. A. as to the general condition of steering gear, brakes, running gear and front and rear axles, and penalties charged for defects according to a fixed penalty schedule. As has been the rule in former years, only stock cars, duly registered, will be eligible and they will be divided into two classes, touring cars and runabouts,

with seven price divisions in each class, as follows: Division 1A, \$800 and under; 2A, \$801-\$1,200; 3A, \$1,201 to \$1,600; 4A, \$1,601-\$2,000; 5A, \$2,001-\$3,000; 6A, \$3,001-\$4,000; 7A, \$4,001 and over. The price divisions are the same for both touring cars and runabouts. Cash or plate to the amount of \$1,400 will be awarded to the winners in the seven price divisions of each class, the award to be based only on the road performance of the car, the winner being the car which covers the route with the least number of points penalty charged to it.

Though no penalties will be charged for repairs or replacements made en route, provided they do not cause lateness at controls, and despite the fact that the A. A. A. rules specifically state that the preliminary examination shall be omitted in the case of a Grade IV contest, the entry blanks state that one is necessary and that all cars must be delivered to the Technical Committee not later than nine o'clock on the morning of October 10, at a place in New York City to be announced later; each car then will be examined, and, quoting the entry blank, "stamps placed upon its essential parts and in such public manner as to enable all competitors to witness the examination." In addition to the public examination, there will be a period of two hours on Friday, October 13th, from two to four o'clock P. M., when the cars are required to be on view with the bonnets off and floor boards raised for inspection by competitors.

The passenger load, which must be carried the full route, conforms to the 1911 contest rules, which state that four or more persons must be carried in touring cars, while in runabouts and surreys, or cars with miniature tonneaus, at least two persons must be carried. The entry fee is \$25 and entries close on October 1st with S. M. Bätler, chairman of the Contest Board of the American Automobile Association, in New York.

Nebraskans Form County Organization.

The Jefferson County Automobile Association is the title selected by motorists of Jefferson County, Neb., for a new club formed in Fairbury. Each precinct in the county is represented on the board of governors. The officers are: President, J. W. McDonnell; vice-president, Luther Nelson; secretary-treasurer, W. M. Lewis; governors, J. Bergeron and Dr. A. J. Coats, Fairbury; F. W. Denney, Eureka; Dr. C. C. Diehl, Pleasant; S. D. Maw, Newton; Louis Jarchow, Washington; George Cleary, Rock Creek; James Amos, Cub Creek; George Lakey, Richland; Henry Heiliger, Plymouth, and John Nider, Gibson.

Milwaukee Club Fills Vacancies.

J. W. Turfts and O. E. Grover have been elected directors of the Milwaukee Automobile Club. They fill vacancies caused by resignations and will hold office until the next regular annual election.

MOROSS VISITS ELECTRIC PARK

But His Racemeet Fails to Electrify Baltimoreans—Burman Plays Leading Part on Dusty Half-Mile Track.

There was a racemeet at Electric Park, a suburb of Baltimore, Md., on Saturday afternoon, 12th inst., on a dusty and antiquated half-mile dirt track which encircles several large buildings and which permits the automobiles to be seen only during the rush down the straightaway and around the curves. The affair was promoted by E. A. Moross and his racing team, and Bob Burman and William Knipper divided honors. The lack of anything like keen competition lessened what would otherwise have been intense interest, as Baltimoreans are prone to enthuse over sports.

The free-for-all handicap in which Burman, at the scratch, allowed Knipper in his big Mercedes, 15 seconds; John Meeker and Earl Segrist, driving Kline cars, 45 seconds, and Leo Shaab, at the wheel of a Stoddard-Dayton, 30 seconds, was the only event to excite interest. Burman got a bad start, which cost him several additional seconds, and these he was unable to regain, owing principally to the cloud of dust which followed the leaders. The best he could do was to finish third, the race going to Knipper, with Shaab and his Stoddard-Dayton second. Two special events at two and three miles, closed to drivers of Kline cars, went to John Meeker.

In the time trials, Burman, in his Blitzen Benz, established a track "record" of 1:08. Knipper, in the Mercedes, and H. J. Kilpatrick, driving a Hotchkiss, contested with Burman and finished in the order named. The two heats for the Remy Brassard also were contests between Burman, Knipper and Kilpatrick. In each Knipper secured the pole and Kilpatrick had the outside, but they could not beat Burman, who finished first, with Knipper second and Kilpatrick about 75 yards in the rear. The summary:

Two miles, special race for Kline cars—Won by J. Meeker; second, E. Segrist. Time, 3:08.

One mile time trials—Won by Bob Burman, Blitzen Benz; second, William Knipper, Mercedes; third, H. J. Kilpatrick, Hotchkiss. Time, 1:08.

Three mile free-for-all, for Remy Brassard. First heat—Won by Burman, Benz; second, Knipper, Mercedes; third, Kilpatrick, Hotchkiss. Time, 3:50½. Second heat—Won by Burman; second, Knipper; third, Kilpatrick. Time, 4:00.

Three miles special race for Kline cars—Won by John Meeker; second, Earl Segrist. Time, 4:24½.

Three mile, non-stock, free-for-all—Won by William Knipper, Mercedes; second, Leo Shaab, Stoddard-Dayton; third, Bob Burman, Benz. Time, 3:52½.

KISSEL TRUCKS IN "WIRELESS" SERVICE

ONE OF THE CARS USED BY OFFICIALS

VELIE CAR EMPLOYED BY HOSPITAL CORPS

KISSEL AND WHITE TRUCKS THAT HELPED TRANSPORT BLUE ARMY'S CAMP EQUIPMENT

ARMY THAT USED GASOLINE TRUCKS

How in Massachusetts War Game Motors Were Pitted Against Horses—Advantages That Were Made Manifest.

Probably the most extensive use of motor trucks in army maneuvers in this country was made during the recent war game of the Massachusetts State Militia, in which seventeen gasoline driven trucks supplied the needs of the Blue Army, while the Red Army used fifty of the old horse-drawn army wagons. The utilization of the two different equipments thus afforded a splendid opportunity for intelligent com-

amount of space saved by using seventeen trucks instead of fifty teams of horses—an item which is of the utmost importance when it comes to guarding and defending a transport train. Furthermore, several days' supply of gasoline for the trucks was carried on the cars themselves, while fodder for the fifty teams of horses had to be procured at every camp site, or added greatly to the load they carried.

Aside from carrying provisions, camp baggage, hay for horses and other regular equipment, the trucks were called upon to transport wireless telegraph outfits, wire and poles for temporary lines, and winches for pulling themselves out of trouble when the occasion demanded it. One of the quartermasters of the Second Regiment de-

WILCOX FASTEST ON DEAD HORSE

In Six Starts He Gets Six Firsts and a Record—Long and Varied Program—Promoting Club Discouraged.

While there were other "live ones" on Dead Horse Hill on Saturday last, they were not quite so "live" as Howard S. Wilcox, of Indianapolis. The occasion was the sixth annual hill climb of the Worcester Automobile Club, Dead Horse Hill being the most conspicuous elevation adjacent to the Massachusetts city of that name. It is not improbable that the contest will prove the club's last effort of the

WILCOX (NATIONAL) IN WHIRLWIND FLIGHT NEAR SUMMIT RUTHERFORD (NATIONAL) WINNING THE \$2,001-\$3,000 CLASS

parison, as weather and road conditions for the horse-drawn vehicles were exactly the same as for the motor trucks.

The fleet of trucks included one, two, three and five ton trucks and 1,000 and 1,500 pound delivery wagons. Several of the more prominent American makes were represented in the Kissel, White, and Gramm trucks and Velie touring cars. One of the latter was employed by the hospital corps, while another car of the same make carried photographers and press representatives.

In a drizzling rain the maneuvers started, and the way in which the motor trucks plowed through the mud of the soft country roads caused much favorable comment among the army officers who attended the war game. Loaded with a complete field outfit for 3,000 men the trucks kept their schedule time without trouble, and despite the fact that none of the officers of the commissary department had ever had experience in transporting an entire battalion's equipment on board of a single truck, the work was performed almost without a hitch. Apart from the matter of speed, the attending army officers remarked the

clared that never again will his command "take the field" with the old style equipment. Although used to the work of the old style army wagons for many years, and naturally prejudiced in their favor, he said that the work of the trucks was a revelation to him.

Four Days Added to Chicago Event.

The Chicago Motor Club has decided to make its annual reliability run, set for October, an eight day event instead of one of four days, and has selected a route running through five states. The night stops will be: Indianapolis, 213 miles; French Lick, 190; Louisville, 58; Cincinnati, 170; Columbus, 200; Detroit, 190; Grand Rapids, 190; Chicago, 215, a total of 1,426 miles. The tour is to start October 6 instead of October 9th and will continue to the 13th inclusive.

Palestine Motorists Organize a Club.

The Palestine Automobile Club has been organized in the Texas town of that name. The officers are: President, Dr. A. L. Hathcack; secretary, James Doss; treasurer, Louis Gooch.

sort. However that may be, it will not serve to diminish the glory won by Wilcox on Saturday.

Changing from one National car to another of the same make he competed in six events and won, all of them, incidentally shattering the "gasolene record." He performed this feat in the record trials, making the mile long ascent in 55.45 seconds. The record for the hill is 54 seconds, established in 1909 by L. F. H. Baldwin in a steam car. There were a couple of steamers in evidence on Saturday, but neither came near Baldwin's figures.

The record which Wilcox broke was 58 seconds, made last year by Caleb Bragg in a big Fiat. Wilcox and his National cars were so fast that they got inside Bragg's figures four out of six times that he made the flight. Fred W. Belcher, in a Knox, also twice bettered Bragg's performance. There were other Nationals present but none of them equaled Wilcox's mount, although they gave good accounts of themselves. J. M. Rutherford, F. E. Randall and John G. Pugh piloted the Indiana made cars, but Rutherford alone emulated Wilcox by securing a first. John

Jenkins, who drove a Cole, was the only man who, like Wilcox, "repeated." He placed two victories to his credit.

Productions of Eastern factories were slimly represented. But three of them were present and they figured in three events as winners, due solely to the fact that they had no competition and enjoyed walk-overs. The honors all went westward.

The program was a long one and as varied as it was long. There was an event for almost every classification under the sun. It was so long and so varied, in fact, that five of the events failed to fill and were declared off for lack of entries, while seven of the twenty which were decided were in the nature of walk-overs. Only two contests had more than three starters, those for stock cars of from 301 to 450 cubic inches, and for non-stock cars

per cent., the last half mile having an average rise of 8.8 per cent.

Insofar as the sport was concerned, there were no accidents, no thrills and little of the spectacular, Wilcox's great work being the chief feature and causing the greatest buzz of comment. The story of the day is fully told by the following summary:

\$2,001 to \$3,000.

of the same dimensions, in both of which Wilcox outclassed the other contenders and won by safe margins.

This paucity of real competition rather wet-blanketed the sport and served to add to the discouragement of the club officials who had given so freely of their time to the promotion of the contest. The crowd, too, although larger than last year—numbering about 8,000 people—was much smaller than had attended the earlier contests. The lack of support afforded by Eastern manufacturers and the tall expense for prizes incurred by the long program, not to mention other things, has about convinced the hard-working officials of the Worcester Club that the game is not worth the candle, and unless a change comes over the spirit of their dreams during the next twelvemonth Dead Horse will be more than ever entitled to its designation, so far as the club is concerned.

The hill, according to survey, is exactly one mile in length and the first quarter mile rises 10.3 per cent. and then eases away to 8.3 per cent. The steepest portion is the second quarter, where it reaches 12.2

First "Automobile Road" in New York.

"This Road for Automobiles Only" is the sign which just has been displayed on the wood paved road which recently was completed on Pelham Parkway, New York, and which parallels the main macadamized driveway. The sign suggests the first public "automobile road" in the big city, if not in the East, but unfortunately cyclists and drivers of horse-drawn vehicles use it whenever in the mood to do so.

Clutches; Their Functions and the Several Types

A clutch, according to the Standard dictionary, is "a power transmitting device operating as by friction or interlocking for securing or breaking rotative continuity." To the automobile owner or operator it is all of that and it may be more. Which is to say, that in addition to being a device by means of which the power from the engine is transmitted to the change gear mechanism and thence to the road wheels, it may be, and not infrequently it is, a fruitful source of trouble. And paradoxical as it may seem, nine times out of the proverbial ten the reason for the trouble is the very simplicity of the clutch itself.

If clutches were come complicated and therefore required a little more attention the number of cases of clutch trouble probably would show a decided decrease. As it is, the majority of clutches are so very simple that they are not even thought of until something goes wrong. Then the clutch is blamed, and it is styled a "necessary evil." That it is a necessity is sure; whether or not it becomes an evil rests largely with the operator. Manufacturers make clutches right and they will stay right until they wear out, provided they are given a little—a very little—attention. But on the score that enough is sufficient, it is essential that a knowledge of the working of the clutch be obtained, though in this respect it should be remembered that the instructions generally issued by manufacturers are paramount and invariably should govern procedures.

Owing to the fact that internal-combustion engines develop their power by reason of explosions within the cylinder walls, and as the greater the number of explosions which take place within a given time unit the greater will be the power developed, it is apparent that a certain number of revolutions of the crankshaft a minute are necessary before sufficient power will have been developed to move the vehicle. To transmit the power of the engine is the chief function of the clutch. It is necessary also to allow the engine to run "free" until it is generating the required power, and to permit of the engine being disconnected from the driven mechanism temporarily to allow of the ratio of engine revolutions to driving wheel revolutions being changed, or in other words, to permit of gear shifting, which operation is practically impossible, at least without danger of damage resulting, unless at least one of the gears which it is desired to engage is stationary.

With external combustion engines, such as steam engines, and with electric motors, clutches are not necessary because the

power is not developed in the engine or motor but is stored in the boiler or battery, as the case may be, and a little of the power, or the maximum which always is held in reserve, may be used at will to start the engine, or the motor, and consequently the vehicle, from a standstill.

As it requires more power to start a vehicle than it does to maintain it in motion, clutches must be so made that they may be caused to slip slightly while the vehicle is being started in order that the number of revolutions of the engine, and consequently the power, shall remain constant until the

FIG. 1.—MITCHELL PRESSED STEEL CONE

vehicle begins to move, when the power may be reduced and the clutch caused to grip firmly. If, for instance, the clutch on an internal-combustion engined vehicle were a positive interlocking device, and supposing that it were possible to engage its driving and driven members with the engine running at the speed necessary to start the car, one of two things would happen, viz., something would break, or the engine would be "stalled," and as soon as the engine stops the power stops.

Therefore, one of the considerations of a good clutch is that it must be possible to slip it at will both for starting and slow running, and also to relieve the engine by permitting it to "turn up" faster and still transmit power on long hard hauls. In other words the clutch must accelerate the car "sweetly," without jar, and at the same time positively. On the other hand, the clutch must not slip except at the will of the operator. Last but not least, the driven member of the clutch, to which the gears are attached, must not spin unduly after the driving and driven members are disengaged.

As it is absolutely essential that the clutch be slipped at times, it is apparent

that a positive interlocking device is impossible of application, and for this reason friction clutches invariably are used. At present, all pleasure vehicles which are the products of American manufacturers, and which have selectively operated change gears, are equipped with master clutches as differentiating from those built some years ago, which were equipped with individual clutches for each of the speeds as obtained by the gear changing mechanism. Individual clutches, while practical—and that they are so is proven by the fact that even today there are a number of cars in use which employ them—necessitate an inordinately bulky and heavy change gear mechanism, and this system now is obsolete. Instead, the master clutch, more commonly referred to simply as the clutch, has supplanted the older system, the result being increased simplicity, reduction of weight and of moving parts, and consequently a reduction in the complication of the car as a whole.

There are five types of clutches in use, as follows: cone, multiple disk, plate, expanding shoe and contracting band. A recent census of American manufacturers shows that car makers are almost exactly evenly divided as regards the use of cone and multiple disk clutches. The plate clutch comes next as regards the number of manufacturers who use it in one form or another; the expanding shoe practically has gone out of use, but one manufacturer now making use of it, while the contracting band clutch is used by only two well known builders in the United States.

As its designation implies, the cone clutch consists of two cones which fit into each other, the female one being the driving member, this usually being formed integral with the flywheel, and the male member which is driven and which is attached to the change gear mechanism. That the driven member may be as light as possible to prevent excessive spinning, which might result in injury to the gear teeth when gears are shifted, and to allow of rapid acceleration for the same reason, it usually is an aluminum casting, though pressed steel, which daily is coming into greater prominence, may be used with excellent results.

Fig. 1, which illustrates Mitchell practice, shows a pressed steel male member in which the frictional material is leather. Leather is used almost universally as a friction material owing to its peculiar properties, though other materials, made principally of asbestos, and in some cases containing fine copper threads, are used to some extent. Eliminating the possibility

of the clutch members getting out of line, and thereby causing that species of clutch trouble known as "chattering," the particu-

FIG. 3—POPE-HARTFORD CONE CLUTCH

larly long clutch bearing which is provided in this instance is worthy of note. Obviously, this clutch, and as a matter of fact, all others of the leather faced cone variety, are intended to be run dry, which is to say, they are not supposed to be lubricated beyond an occasional dressing with neat's foot or castor oil, to preserve the leather in that state of flexibility and moisture which is absolutely necessary for sweetness of action.

In some makes of clutches, smoothness

springs are compressed more and more, increasing the effective area of the friction material, till the clutch is fully engaged. As the area of the friction material in contact with the female member is smaller when the clutch is only partly engaged, a greater amount of slipping takes place, and as the area is increased the slipping decreases

which is to say that when the clutch is disengaged the male member is partly outside the flywheel casting. The internal type of cone clutch differs from the other in that the cone is reversed. As the internal cone clutch necessitates that the flywheel be made in two parts in order that the cone may be inserted in the first place, it is

FIG. 2—SPRINGS THAT EASE ACTION OF KISSEL CONE CLUTCH

gradually until it stops when the clutch is fully engaged.

A somewhat similar arrangement of springs is shown in the Kisel clutch, which is illustrated in Fig. 2, except that in this case the springs are spiral instead of being

much more expensive to manufacture, and owing to the fact that it possesses no advantage other than that the thrust on the crank shaft bearings may be eliminated more easily than can be done with the external clutch, it has fallen into disuse.

Comparatively recently another method of ensuring smooth action by the insertion of cork in the leather facing has been developed, and a large number of manufacturers now use clutches which are so

FIG. 4—STEARNS DRY PLATE MULTIPLE DISK CLUTCH DISASSEMBLED

of action is ensured by providing small flat springs under the leather face at intervals around the periphery. In action, these springs press the leather away from the metal to which it is attached. As the clutch is "let in," the "high spots" come in contact with the female member first and as weight is removed from the clutch pedal, allowing the engagement of the clutch, the

flat. They are enclosed in the small housings designated A, and in action they are practically the same as the flat springs. The male member which is illustrated is an aluminum casting, and like the pressed steel member shown in Fig. 1, it is faced with leather.

Both of those types of clutch which have been described are of the external type,

FIG. 5—MATHESON MULTIPLE DISK CLUTCH

equipped. The cork (or corks) are inserted in the manner shown in the Pope-Hartford clutch shown in Fig. 3, the corks being designated A. The use of cork, however, is not confined in application to cone clutches, but may be, and is, used with equally good

results on clutches of all types, and also has been used in brakes.

The particular virtue of cork as a frictional material lies in its great elasticity coupled with its high co-efficient of friction and its remarkable ability to withstand heat and wear when used under compression as an insert. The corks are inserted in sockets in the periphery of the male clutch member and protrude a fraction of an inch beyond the leather facing or other frictional material. Applied in this manner, the cork always works alone at low or medium pressures, but at higher pressures the leather or metallic surface in which they are inserted also comes into engagement.

Owing to the manner of placing the corks in sockets under pressure the wear on them is very slight, the natural elasticity of the cork causing the inserts to return to their original height above the metal or leather facing as soon as the spring pressure on the clutch is released. Cork in-

The multiple disk clutch, as its name implies, consists of a number of thin metallic disks, varying from 10 to 60, half of which are keyed to the engine, being usually encased in a housing in the flywheel, and half attached to the change gear mechanism. The "driving" and "driven" disks are placed alternately, and when the clutch is engaged, these disks are pressed together firmly and thus form a friction drive of considerable surface. Multiple disk clutches are of two general types, those that operate in an oil bath and those that run dry, the former usually being composed of alternate steel and bronze or all steel disks and the latter of steel disks, one set of which is faced with friction material.

The Stearns clutch, illustrated complete and also disassembled in Fig. 4, is of the dry type, the driving disks (C) being faced with an asbestos friction material, and the driven disks (B) being hardened and ground saw steel. Differing from usual practice, which embraces the use of a sin-

ing the driving and driven disks to their respective members. The slots (A) in the driving disks engage similarly shaped lugs in the flywheel housing while the slots (B) in the driven disks engage the lugs (C).

Differing from the usual type of multiple disk clutch, the Hele-Shaw clutch, illustrated in Fig. 6, and which also is of the oil bath type, consists of a number of alternate bronze and mild steel disks which have a V-shaped corrugation around their peripheries which increases the amount of effective friction surface, and consequently the gripping effect, threefold.

Referring to the illustration, the outer oil-tight case (1), to which the driving bronze plates (16) are keyed, is bolted to the flywheel of the engine. The inner core (2) is keyed directly to the clutch shaft and to it are keyed the driven steel plates (17). The clutch is shown engaged as normally held by the spring (4) which actuates the ring (7) and the sliding presser (3). To facilitate quick disengagement, small

FIG. 6—HELE-SHAW CORRUGATED DISK

serts possess many advantages, not the least of which is that owing to the high co-efficient of friction of cork, clutch spring pressures may be materially reduced, in addition to which it is pointed out by the National Brake & Clutch Co., by whom patents governing the use of cork inserts are owned, that even in the presence of oil which might cause slippage unless excessive spring pressures were used to maintain contact, the corks so largely increase the frictional adhesion that slippage is eliminated with but moderate spring pressure.

The principal objection to the cone clutch is its size and weight, both of which are necessary when high powers are to be transmitted. When the male member is released obviously there is a tendency for it to continue in rotation for a certain length of time, and as it is difficult, at least, to shift gears with the "clutch spinning," to say nothing of the chance of damage resulting to the gear teeth, it is necessary either to wait until the spinning has ceased or to provide some means of stopping it. For this purpose, and to eliminate "dragging," the clutch brake has been devised and is used by a number of manufacturers, though opinion is divided as to its merits.

FIG. 7—THREE-PLATE CLUTCH USED ON VELIE CARS

gle large clutch spring around the clutch shaft, the Stearns clutch is equipped with a number of small springs (C) arranged in a circle around the shaft.

The particular virtue of the multiple disk clutch lies in the fact that owing to the large friction surface which is obtained through the use of a number of disks, it may be made comparatively small and light. An additional advantage is that the multiple disk clutch, of either the dry or oil bath type, may be slipped without damage to a greater extent than can the cone type. Both types provide extremely smooth action, though in this respect it is a matter of opinion which is the better or smoother of the two.

The Matheson clutch, which is illustrated in Fig. 5, operates in an oil bath, the theory of its operation being that when the plates are brought into contact, as when the clutch is engaged, a thin film of oil remains for a time between the disks and is squeezed out gradually. As the oil is squeezed out, the friction between the disks increases, and when all the oil has been forced out the disks are in contact, the engagement, which is governed by the rate at which the oil is forced out, therefore being gradual. This illustration also shows the method of key-

ing the driving and driven disks to their respective members. The slots (A) in the driving disks engage similarly shaped lugs in the flywheel housing while the slots (B) in the driven disks engage the lugs (C).

Differing from the usual type of multiple disk clutch, the Hele-Shaw clutch, illustrated in Fig. 6, and which also is of the oil bath type, consists of a number of alternate bronze and mild steel disks which have a V-shaped corrugation around their peripheries which increases the amount of effective friction surface, and consequently the gripping effect, threefold.

The expanding shoe clutch is very seldom used in present day practice, there

being but one little known manufacturer who regularly uses it. As has been previously stated, a successful clutch must be fairly light at the rim, but with the expanding clutch, owing to its method of operation, this is almost impossible, since the moving parts and their connections are of necessity near the rim. Some manufacturers have attempted to get over this difficulty by making expanding clutches very much smaller in diameter, but this method has the disadvantage that the parts must be made small and therefore are hard to adjust. In addition, small parts are liable to get out of order and to wear rapidly, and this reason, and because of the fine adjustment which small parts require, probably accounts for its absence on modern cars.

The contracting band clutch also is heir to some of the ills of the expanding type, though it has the advantage that, as it is outside the fly wheel, all parts are readily accessible and are easy of adjustment. Careful refinement of detail and the use of better materials have made this type of clutch possible, however, and it is used by several prominent manufacturers with excellent results.

Ingenious Tell-Tale for Tail Lights.

Tired of being haled before magistrates and fined for having permitted the rear lamp to be extinguished, a German chauffeur recently devised an adaptation of the laryngoscope which enables him to keep the number on the rear of his car in constant view. It consists of a prism, attached to the rear of the car in such a manner as to reflect the illuminated number to a second prism enclosed in a tube. The second prism conveys the image by means of two other prisms to the dashboard of the car, where on a ground glass plate, about two inches square, a greatly reduced picture of the number appears, visible at all times when the light is shining upon the plate. Some years ago an English patent was granted for a mirror arrangement designed for a similar purpose, but after a few trials it was dropped, on account of its liability to damage and general unreliability. The present system, being completely enclosed in metal tubing, is said to be dust-proof and fool-proof. Should the shape of the tonneau require it, more prisms may be added without interfering with the clearness of the image.

Fennies That Render Cranking Easier.

When an engine of the objectionable pattern that is built without either compression release or petcocks refuses to start, a simple method of rendering cranking easy is to insert pennies between the respective exhaust valve stems and tappets, this raising the valves slightly off their seats. By this means it will be an easy matter to "swing" the crank. Once the difficulty has been located and remedied the "props" can be removed.

DO WIRE WHEELS LESSEN TIRE WEAR?

**Interesting Experiment Conducted Abroad
Indicates an Affirmative Response—
American Opinions on the Subject.**

Controversies regarding the relative merits of wire wheels and the very much more common wooden artillery wheels have been numerous, and while it now is generally accepted that if the factor of strength and safety with wire wheels is no greater, at least it is as great as with the artillery type, the question of the effect of each type on tire wear still remains, due principally to a lack of accurate data on the subject. Such data, recently obtained through a series of experiments made by one of the largest British manufacturers, the Daimler Co., Ltd., however, tends to show that under certain conditions wire wheels possess a decided advantage in this respect, which fact is still further supported by the opinions of a number of members of the Automobile Club of America who recently were canvassed in an effort to ascertain their views on the economy and efficiency of wire wheels.

As a result of the canvass made by the A. C. A. it developed that of four members whose cars were equipped with wire wheels none had an objection to offer. Though they were unanimous in their views as to the superior strength of the wire wheels, only one could state positively that their use resulted in a saving in tire expense. "My calculation is that I get 1,000 more miles of travel out of my tires on the wire wheels than I did when I used wooden wheels," he said. Several others advanced the opinion that at least the wire wheels did not wear the tires out any faster than wooden ones, and there was a general feeling that tire depreciation was less with wire wheels than with the more commonly used wooden ones.

The experiments which were carried out by the Daimler company were made by that department which has to do with the renting of cars in London, and a careful record was kept of all repairs and replacements. The tires used were of the non-skid variety, 37 x 6, and as all of the cars to which they were fitted were practically identical, with heavy covered bodies, the figures obtained are instructive in that they show that with wire wheels the average number of miles per cover obtained was greater by 1,404 miles than that obtained when the tires were fitted to wooden wheels.

For the test, 100 covers were used, half of them being placed on wooden wheels and the other half on wire wheels. The total mileage obtained from the 50 covers taken from the wire wheels aggregated 172,731 miles, an average of 3,454 miles per cover, as against an aggregate of 102,524

miles, giving an average of 2,050 miles per cover for those fitted to artillery wheels. Though the tires were of the non-skid variety, it is not stated whether they were of the steel-studded type, though it is probable that they were not.

Why V Engines Lack Popularity.

"The question has been asked why the V type of engine has not made any appreciable headway among motorists, though it occupies so pre-eminent a position in aeronautics," remarks a well-known British authority, who adds: "It is possible that the difficulty of even selling a car which has a wide bonnet is a sufficient and therefore a final reason against its adoption. There are, however, minor difficulties. Thus the importance of being able to use the standard magneto ignition is such that if the groups of cylinders are to be in V form, the angle used should be such as to ensure that the interruption of current does not occur when the armature is in a poor position for cutting the magnetic lines. Again, the arrangement of inlet, exhaust, and water pipes is less convenient than with vertical cylinders, and the use of splash lubrication is rather less satisfactory, since the cylinders on one side of the crank case get much more oil than the others, and it is difficult to adjust the amount of lubricant so that the one set of cylinders does not smoke and the other set does not get dry. When time and work begin to prove that the car engine of 25 horsepower by R. A. C. rating, weighing 300 pounds, can be replaced by one which weighs but 100 pounds, the solid advantage and economy of the latter may begin to tell, and the preference for a long bonnet over a wide one will give way. But the 100 pound engine is still to seek."

Straw as a Non-Preventive of Skidding.

Straw may be a good thing to slip under the wheels of a hay wagon when the ground is muddy and the wheels are slipping, but it is not so safe when applied to the rear wheels of an automobile. At least, that is what Arthur Taylor, a Kansas farmer, says—and he ought to know, because the experience cost him his brand-new automobile. His car was stalled in the sand and he piled a heap of wheat straw under the wheels. When he started the engine again the exhaust gases issuing from the muffler were hot enough to set fire to the straw, and in less than fifteen minutes his car was a heap of worthless junk. He has ordered another car, but he included in the order a set of non-skid chains as the most important accessory.

When Measurements May be Deceptive.

When gauging the amount of fuel in the gasoline tank with the elementary expedient of thrusting a stick down through the filler opening, it is well to observe whether the car is standing on level ground or whether it is inclined.

MAKERS DISCUSS CONTEST RULES

**Many Changes Recommended to A. A. A.,
But Few of Them Made Public—Min-
utes of Meeting Being Transcribed.**

As a result of the last meeting of the general rules committee of the Manufacturers' Contest Association, which was held in Detroit on Friday last, 11th inst., it is practically certain that the contest rules of the American Automobile Association will be changed considerably to conform to a number of recommendations which were made during the session. For some time it has been apparent that the rules of the sports governing body are not just as they should be and the purpose of the meeting was to ascertain the views of the members on a number of questions covering racing and other contests from nearly every angle.

Fifteen Members of the Manufacturers' Contest Association were present. S. M. Butler, chairman of the Contest Board and F. E. Edwards of the Technical Committee of the American Automobile Association also attended the meeting which was long drawn out by reason of the great number of matters which were up for discussion. But until the minutes of the meeting are transcribed not much that is truly satisfying will be made public.

One of the principal recommendations which was made, and one which in all likelihood will be incorporated in the rules was that the weight limitation in stock car events be removed. The recommendation was made at the request of a number of light car manufacturers who complained that they were being discriminated against in this respect and was accepted with the further provision that stock car events be reduced in number so that they can be run under the direct supervision of the A. A. A. Contest Board.

During the general discussion on racing which followed, Chairman Butler pointed out that owing to lack of funds to employ competent men the Contest Board was unable to exercise the rigid supervision which racing demands and it was decided to have a committee attend the meeting of the M. C. A. in New York on Sept. 6 and ask their co-operation and financial backing in order to place the Contest Board on an independent basis.

When approached on the subject of the meeting, Chairman Butler, though courteous, was none the less firm in his refusal to say anything whatever about it and suggested that the desired information might be obtained from Russell A. Field, secretary of the M. C. A. Field, however, was equally reticent and excused himself by saying that the minutes of the meeting had not yet been transcribed and that nothing definite would be said until the first of next week.

From other sources, however, at least some of the things which were done leaked out and the sum and substance of them is as follows: It was unanimously decided that no more sanctions be issued for half-mile tracks and it was further recommended that mile tracks be safeguarded by the liberal application of oil or some other substance to lay the dust and that the fence be moved away from the course. To insure the carrying out of such regulations it was decided that each promotor be required to file a bond before a sanction is issued. It also was suggested that the number of starters be limited to one for every 400 feet of track.

Matters pertaining to reliability contests and to beach and road racing likewise were threshed out and though recommendations were made in each case they have not been divulged, and it probably will be some time before the M. C. A. decides to take the public into its confidence.

Finds Shorter Road Cross-Continent.

Transcontinental motor trips are becoming so common that it will not be long before a number of regularly laid out routes are at the disposal of every motorist in the country, to follow which he has but to "mind the map" and watch the signs at the cross roads. Generally these transcontinental trips have followed either the northern "prairie" route, or the southern route, the so-called Santa Fe trail. A third and more central route, however, has just been charted and laid out by W. A. Peck, western sales manager of the Midland Motor Co., who covered the 2,645.5 miles in 124 hours' running time.

The new route leads through the Rocky Mountains in Colorado by way of Tennessee Pass and the Holy Cross Forest Reserve, touching Buena Vista and going through the Western Slope fruit country and the Utah desert, through the mining towns of Ely and Eureka, thence to Reno and Sacramento to San Francisco.

The itinerary of the whole trip is as follows:

	Miles.	Hrs.	Mins.
Moline to Des Moines.....	229.6	8	15
Des Moines to Omaha.....	178.2	6	21
Omaha to Gothenburg.....	270.3	8	41
Gothenburg to Sterling.....	203.7	6	3
Sterling to Denver.....	147.0	5	15
Denver to Buena Vista.....	134.6	7	4
Buena Vista to Glenwood Springs	138.2	8	32
Glenwood Sp'gs to Debeque..	60.5	3	32
Debeque to Palisades.....	30.0	1	15
Palisades to Grand Junction..	14.5	..	25
Grand Junction to Mack.....	21.2	1	2
Mack to Thompson.....	67.8	6	23
Thompson to Woodside.....	60.0	4	8
Woodside to Sheya's ranch... 63.8		5	23
Sheya's ranch to Scofield....	15.7	2	41
Scofield to Thistle.....	36.5	2	45
Thistle to Salt Lake.....	68.5	8	6
Salt Lake to Kearney's ranch..	172.6	8	6
Kearney's to Schellbourne....	81.3	4	40
Schellbourne to Ely.....	48.0	..	58
Ely to Eureka.....	79.3	3	51
Eureka to San Francisco.....	529.2	31	21
	2,645.5	124	37

ELGIN PREPARES FOR ITS BIG DAY

**Entries for National Road Races Promise
Stirring Sport—Arrangements Effected
and Prizes Listed.**

With a total of 29 entries to date—cars which for speed and endurance are well known to the initiated and the uninitiated alike, and drivers who with but few exceptions have proven their ability in previous road races, many of them in fact having contributed their share to the contests over the same course last year—the 1911 national stock chassis road races which will be held on Friday and Saturday, 25th and 26th inst., at Elgin, Ill., give promise of equaling, if not bettering, in speed and in general interest those of last year; it was then for the first time that the 8½ miles course near the Watch City was the scene of a national event, or for that matter of any other automobile contest.

Ralph Mulford, the blond New Yorker, who last year simply romped away with the Elgin trophy, the chief bone of contention, will be there to defend the trophy; De Palma will be on hand with a Simplex; Spencer Wishart, who previously has been seen almost exclusively at the wheel of a Mercedes, will pilot another Simplex; Hugh Hughes, who of late has been "cleaning up" with a Mercer, is due to start—all of them in the race for the Elgin trophy—and of course Harry Grant, twice winner of the coveted Vanderbilt cup, will be there with his famous "No. 18" Alco.

As a matter of fact, there will be two other Alco cars there as well, the occasion marking the debut of the Alco racing team of three. Frank H. Lee, Grant's former mechanic, will pilot the second Alco, and Harry Hartman will handle the third one. All three of the cars will be "decked out" in new racing toggery, which means that the familiar black chassis and the uniforms of the drivers will be enlivened by the addition of a white stripe. On the cars, the stripe will be on the frame members from the front to the rear spring connections; the drivers' black sweaters will have a two-inch white stripe around the right arm and similar stripes will be woven into their stockings. The National stable also will be well represented, though its drivers have not yet been named.

For the lighter car races, the Illinois trophy for cars in the 301-450 class, the Kane County trophy race for the next size smaller cars—231-300 inches—and the race for cars in the "baby" class for the Aurora cup, which last year was styled the Fox River trophy, but which this year has been renamed in recognition of the generosity of the Aurora Automobile Club in donating the cup, equally well-known drivers have "signed up," and though some of the names still are withheld, the entrants as a

whole constitute a "classy" lot. The complete list to date is as follows:

Elgin National, stock chassis under 600 inches.

Car.	Driver.
Alco	Grant
Alco	Hartman
Alco	Lee
Cino	Burt
Lozier	Mulford
Mercer	Hughes
National	Not named
National	Not named
Pope-Hartford	Buck
Simplex	De Palma
Simplex	Wishart

Illinois Trophy, stock chassis 301-450 inches.

National	Not named
National	Not named
Vellie	Jeffkins
Vellie	Stickney

Kane County Trophy, 231-300 inches.

Cino	Raimey
Cino	Burt
Colby	Pearce
Colby	Armstrong
Colby	Not named
Cole	Jenkins
Cole	Not named
Corbin	Maisonville
Fal	Greiner
Fal	Gelnaw
Fal	Pearce
Mercer	Hughes
Mercer	Barnes
Staver-Chicago	Not named
Staver-Chicago	Not named
Staver-Chicago	Monckmeier

Aurora Cup, stock chassis 161-230 inches.

Abbott-Detroit	Roberts
Ford	Kulick

The length of the course this year will be exactly the same as last year—8½ miles—but in view of the extensive alterations and improvements which have been made, it is not unlikely that the record of 62.56 miles an hour made by Mulford will go "by the board." The road has been considerably widened in places and many of the sharp curves have been straightened out; the home stretch has been widened from 16 to 54 feet; the Udine turn, which last year caused a considerable slackening of speed, has been remodeled and widened to 100 feet and the telegraph poles have been moved out of the way. More oil has been sprinkled to date than was used last year, and in fact everything possible has been done to increase the safety of both contestants and the public. As an almost certain indication that a record crowd will be on hand, it is stated that already the sales of tickets and parking spaces is greater than the total last year.

The prizes, too, are fatter than ever. To the \$2,500 which is offered by the Chicago Motor Club and the Elgin Road Racing Association, by whom the affair is being jointly fathered, there has been added just about twice that much again. The Remy Electric Co. holds out the promise of \$250 for first, \$100 for second, and \$50 for third to each of the Remy equipped cars in the three larger races; the Bosch Magneto Co.

has hung up \$350 for the big race and \$200 for each of the others; the Dorian Rim Co. offers \$250, \$150 and \$100 for the first man to finish on Dorian rims in the Elgin trophy, the Illinois trophy and the Kane County races, respectively.

The use of a Rayfield carburetter by the winner of the Elgin trophy will bring in \$500, while \$100 goes to the winners in each of the other races, these amounts having been "hung up" by Findeisen & Kropf. The Stromberg Motor Devices Co., heads the list, however, with \$1,600 to be distributed, \$500 of which will be given outright, regardless of equipment, merely to encourage speed. Of the \$500, \$200 goes for the fastest lap in the Elgin trophy race and \$100 in each of the others. In addition, the use of a Stromberg carburetter is worth \$500 to the winner of the big race and \$200 to the winners of each of the others. The amount is still further swelled by the offer of the Sears & Cross Co. of \$200 to the users of its speedometer.

Lessons Learned in Tour to Helena.

In Minneapolis, where the Twin Cities to Helena reliability tour had its inception and recently was brought to a very successful ending in the last named Montana city, those motorists who made the long trip have not yet stopped eulogizing on the merits of their special "Automobile train"—the train that not only provided the tourists with food and lodging but in addition furnished them with that requisite of metropolitan life, a daily newspaper. "The Carburetter," it was styled, and if there was anything that happened on the tour which failed to meet at least one of the many pairs of eagle eyes of the editorial staff it must have been inconsequential indeed. The paper was printed on the train—not mimeographed or typewritten, but printed and well printed, too.

But to get back to the train, and that there were few of those on the tour who were not glad to get back to its sheltering portals—if trains have such things—was evidenced by the rushing business that was done in "eats and sleeps," it was such a good feature of the trip that already plans are under way to have another such moving hotel "officially entered" in next year's tour. That the tour will be held next year is certain, though it is by no means as certain just where it will go. It is possible that either Spokane or Portland will be chosen as the destination and it is likely that the distance traveled each day will be less, which will be possible if the tourists are accompanied by a "hotel train" which can be stopped anywhere along the route to suit their conveniences.

Different rules will be adopted, if possible, as a modification of the Grade 3 tour, to promote the sociability side of the run, which was catered to this year by changing the passengers in the cars frequently each day. It is probable also that a lower rate of speed will be enforced, for "beating it"

was the rule this year, and the toll paid in damaged tires and springs was too heavy not to convey a moral. But whatever other changes are made, the method of marking the course surely will have to be changed. Last year plain confetti was used and it blew away. This year long strips of colored paper wired together were used, but they proved altogether too popular with the souvenir-hunting public and also with the prairie dogs, which on more than one occasion were seen carrying them into their holes. Though the paper was not thought to be edible and it hardly was suspected that the little animals wanted it for fodder, one of the voracious participants in the contest declares he saw a yearling bull contentedly munching a bunch of the confetti, and what with the depredations of man and beast there scarcely was enough left to mark the trail and the route was lost several times because of the fact.

Sanitation Expert Crosses the Continent.

After zigzagging for 10,000 miles across the continent in his Stoddard-Dayton car and visiting practically every important city during the eight months' trip, B. O. Tilden, president of the American Sanitary Works, of New York, reached Los Angeles on the 10th inst. on his widely-heralded "Sanitation Tour." Whenever possible, he and the experts accompanying him preached the gospel of sanitation, which in turn is expected to prove highly profitable to the manufacturer of "sanitation" apparatus and appliances. From Los Angeles the party drove to San Francisco and there took the steamed for Honolulu, for a tour of the Hawaiian Islands.

Firestone Averts a Water Famine.

Confronted with a water famine, owing to the shutting down of the city's pumping engines for repairs, the citizens of Akron knew hardly where to turn in their trouble when H. S. Firestone, president of the Firestone Tire & Rubber Co., placed the private pipeline of his company, as well as the big pumps of the Firestone factory, at the disposal of the city. He not only told them to use his own water works as long as they needed them, but that he would not charge them a cent for the use. As a result the Firestone company is decidedly in high favor with the citizens of the "Rubber City."

Elovements That Help Negro Drivers.

Two recent elopements of chauffeurs with their employers' daughters have exerted unsuspected influence in favor of negro drivers. In at least two known instances, the "smart" white chauffeurs employed by well-to-do families which included several daughters of marriageable age, have been displaced by negroes, and to intimate friends the heads of both families admitted that their actions were influenced by the stories of elopements with which the daily press has been filled.

DAYTON'S SLIDE-VALVE A "SIX"

Knight Model Also Has Left-Hand Control and Other Features—Adjustable Seats for All Models.

It has long been known to the trade-wise that Stoddard-Dayton cars were among those that were to be equipped with the Knight engine, but not until the official announcement this week of its plans for the forthcoming season by the Dayton Motor Car Co., of Dayton, Ohio, its builder, was it known definitely on how elaborate a scale the innovation was being planned. And the plans contained a surprise in that the new Stoddard-Dayton Knight car, unlike any of the sleeve-valve products thus far introduced in this country, is to be furnished with a six-cylinder engine having its cylinders cast in groups of three. It

styles and equipments. Due to this amplification of types, which has been a Stoddard-Dayton characteristic for several years, the new line will comprise no less than 25 distinct and catalogued cars. It thus becomes one of the most varied of the many products which the American industry now affords.

Despite the distinction which is gained by the adoption of the sleeve valve engine in the large car, it is the Special that is to be known as the leader of the line. This is described as a seven-passenger touring car having a four-cylinder 5 x 5½ inch motor of 58 horsepower and embodying many of the features which have proved successful in former models together with a number of striking modifications. Among these may be enumerated the adoption of the Bosch "two-independent" ignition system, a magneto coupling that permits adjustment for timing without disengaging the gears, a dash adjustment for the carburetter, the introduction of cored passages

be obtained as a seven-passenger touring car or limousine, a six-passenger torpedo, or with 122½-inch wheel base as a four-passenger torpedo or two-passenger and semi-torpedo roadster.

The Saybrook is a \$2,800 car, constructed with seven-passenger open and closed bodies and with four- and two-passenger open touring mountings. It has a 4¾ x 5 inch motor, like that of the Special, of the valve-in-the-head pattern, and rated at 48 horsepower. It is made with 122½-inch wheel base and shod with 36 x 4½ tires. It has the two-independent ignition system as the two larger cars, save that the current for the electric lights is furnished by a storage battery exclusively, instead of by a dynamo and battery in combination.

An L-head type of four-cylinder motor is employed in both the Stratford and Savoy models, which also differ in equipment from the three larger models, to the extent that they have oil and gas lamps, instead of electric, and which also have dual instead

STODDARD-DAYTON SPECIAL SIX-PASSENGER TORPEDO

STODDARD-DAYTON-KNIGHT SIX-CYLINDER TOURING

also is to be distinguished by an application of left-hand drive with centrally mounted control levers, electric lighting with a dynamo for supplying current and a most elaborate equipment, even for a car selling, as it does, for \$5,000. This equipment, be it added, includes besides the lighting dynamo, storage battery and lamps, 36 x 5 inch tires, top with boots and windshield, Hartford shock absorbers, large Klaxon and bulb horns, Warner speedometer, trunk rack, five demountable rims, spare tire holder, and such approved body fittings as running board tool boxes, foot and robe rails, foot accelerator, seat covers, tools and the usual assortment of extra parts. The standard mounting for the new Knight model is to be a seven-passenger touring car, but it also will be obtainable as a two-passenger semi-torpedo roadster, four-passenger torpedo and a seven-passenger limousine.

Following the practice already inaugurated in other divisions of the United States Motor Co., of which the Dayton Motor Car Co. is a unit, the various models hereafter will be known by distinctive names, instead of by the somewhat illusive model numbers which hitherto have prevailed in designating various products. Thus there will be in addition to the Knight, the "Special," "Saybrook," "Stratford" and Savoy models, each obtainable in a variety of

in the crank case through which air is passed on its way to the carburetter with the double purpose of raising its temperature and cooling the oil, a movable dam lubricating system, and an ejector type of exhaust manifold, so contrived that by a nozzle-like construction, the discharge from one cylinder is made to effect a partial exhaustion of the next cylinder to evacuate, thereby assisting in the clearing of the waste products and securing a virtual scavenging of the cylinders.

Contributing to the comfort of the driver and passenger in front, a most welcome innovation has been introduced in the Knight, Special and Saybrook models, in an adjustable seat arrangement. With equal partiality to motorists who are long or short in length of limb, the seats may be moved forward or back through a sufficient range to secure convenient accommodation. A further point of excellence in design is the provision of rubber buffer-blocks between bodies and frames, thereby taking care of considerable minor vibration which ordinarily tends to rapid body deterioration and which also is transmitted to the persons of the passengers in varying amounts.

The Special model is regularly built with 130-inch wheel base, and, like the Knight car, is electrically lighted and otherwise outfitted in practically the same elaborate manner. Its list price is \$3,500, and it may

of double-independent ignition systems. In other respects they have the full equipment which is a feature of the entire line. The Stratford has a 4¾ x 5¼ inch 38 horsepower motor, 114-inch wheel base and 36 x 4 inch tires. It is fitted out as a five-passenger touring car selling for \$1,850, and also as a seven-passenger limousine or landaulet and as a three-passenger coupe or a two-passenger semi-torpedo.

The Savoy, the smallest member of the line, has a 28-horsepower 4 x 4½ inch motor, 112-inch wheel base and 34 x 4 inch tires. It sells for \$1,450 either as a five- or four-passenger touring car, a two-passenger roadster, or with either of two styles of commercial car body.

While the 25 models constructed for the four different chassis are distinct, it is noteworthy that they are uniform in design and conform so closely as to constitute in reality a series of different sizes of a much more limited number of individual types. In this connection it may be mentioned that in the two-passenger roadster type a new style of torpedo construction has been inaugurated. A large storage compartment for spares and luggage is provided in the rear compartment. To afford easy access to this compartment, and at the same time to preserve the continuity of the body lines, entrance to it is obtained through the back of the seat.

NEW IDEAS IN A MOTOR WAGON

Detroit Production that Employs Sectional Frame and Novel Engine—Advantages Sought and Claimed.

In developing its new light delivery car, to which it has given the simple designation the Motor Wagon, the Motor Wagon Co., of Detroit, which scarcely is four months old, has introduced a number of

THE MOTOR WAGON, A NEW LIGHT DELIVERY MODEL

features which long ago were set down as ideal for that particular class of work. They include a double-opposed two-cycle motor, thermo-syphon cooling, planetary change gear mounted on the counter shaft, and a general absence of small parts, which is really remarkable in a motor vehicle of small dimensions. In addition, the sectional form of construction has been adopted, with the result that in the event of damage, portions of the frame may be replaced with an ordinary wrench. The rated carrying capacity is 800 pounds and the price \$610.

By the exercise of considerable ingenuity the motor has been rendered exceedingly simple both in form and operation. It is arranged that the charges in both cylinders are ignited simultaneously. That is to say, the pistons moving in opposite directions, a double charge is drawn into the crank case during each combined induction-compression stroke, while at each firing stroke it is compressed to a sufficient pressure for transfer purposes. But one carburetter is used, as a matter of course, but the cylinders exhaust into separate mufflers. The engine is built without gears, the special form of commutator employed being mounted directly on the crank shaft. Force-feed lubrication is employed, the oiler being mounted above the crank case, as the accompanying picture shows, and driven from the crank shaft by means of a spring belt. The fan type of fly wheel is used, so that the need of a separate fan for draught purposes is dispensed with.

As the impulses in the two cylinders exactly counterbalance each other, it follows that the motor should be free from vibra-

tion and quiet in operation. The cylinder dimensions are 4 x 4 inches and the rated output of 16 horsepower is developed at a crank shaft speed of 900 revolutions per minute. The motor is hung on two points from the main frame, heavy brackets supporting the two cylinder heads. It drives by propeller shaft to the counter shaft unit, which also embodies the two-speed planetary change gear, the latter having a multiple-disk clutch for high speed running. Final transmission is accomplished by

being of the semi-elliptic pattern, transversely placed, while the rear of the vehicle is hung on full-elliptic side springs. The rear axle is of 1½-inch square section, cranked to afford a three-inch drop in order that the loading platform may be as low as possible.

The standard type of body adopted is of the open express pattern, with a loading space 60 inches long by 36 wide. The body sides are eight inches deep, with six-inch flare boards. The loading platform is only 24 inches from the ground, making the machine particularly convenient for the uses of small tradesmen. The gasoline tank, which is of 15 gallons capacity, is located under the seat, conforming to general practice.

How He Kept Patches on Inner Tubes.

"I thought I knew about all there was to know about repairing inner tubes," remarked a motorist, "but I got onto a wrinkle not long ago that I verily believe has saved me considerable annoyance and the trouble of repatching tubes occasionally. I used to be a little bit careless about replacing patched tubes repaired on the road, and as a result I frequently had to do the job all over again a few days later because the patch had worked loose. Finally I discovered that whenever a patch worked loose it was because I had put the tube back in the shoe in the same position it was when it was punctured. In other words, the repaired part of the tube came up against the punctured part of the shoe,

DOUBLE-OPPOSED 16 HORSEPOWER TWO-CYCLE MOTOR WAGON ENGINE

spur type, this arrangement having been adopted with an eye to relieving the gear of the sharp impacts which are incident to steering control in a vehicle equipped with solid tires. A form of three-point spring suspension is employed, the front member

and as there always is a slight abrasion where a shoe is punctured, it just chafed on the patch until it worked loose. Now I am careful to turn my tubes around after they have been patched and I never have any more of that kind of trouble."

ALTERATIONS IN MAXWELL LINE

While Not Radical They Are Notable and Enhance Values—New Oiling System Among Innovations.

Displacing models GA, EA, I and AB, the "Special," "Mercury," "Mascotte" and "Messenger" will constitute the forthcoming product of the Maxwell-Briscoe Motor Co., of Tarrytown, N. Y. In a general way, as the preliminary announcement of sev-

of Maxwell design in respect to power plant construction and general arrangement of parts, it is an entirely new and much larger model than has been produced heretofore. It is equipped with a long-stroke motor of $4\frac{1}{2} \times 5\frac{1}{4}$ inches, bore and stroke, which takes a 36 horsepower rating, although it is said to develop fully 40 horsepower under favorable conditions. The cylinders are separately cast, instead of being arranged in pairs, as in the Mascotte, but the extension of the upper crank case section to form a housing for the

struction which has become familiar in connection with the so-called "pump-over" system, of which the new Maxwell is in reality a modification, the crank case is not subdivided. Instead there is provided under each crank a small trough which is directly in the path of the connecting rod and into which a small knife-blade attached to the under side of the connecting rod bearing dips at each revolution of the shaft.

It is the cutting of the several small knives through the oil in the respective troughs that causes the oil to be splashed up against the cylinder walls and piston interiors, whence it finds its way down the sides of the case into the different bearings and finally back into the lower portion of the engine base casting. Owing to the relatively small cross-sectional area of the troughs, it follows that the level of oil in them is practically unaffected by disturbances of the car, whether it is starting and stopping, running on side-sloping roads or on grades. On this account there is no risk of either starving or flooding either of the cylinders so long as the oil in the troughs is constantly being replenished.

To take care of the increased power of the new model the diameter of the disks employed in the multiple-plate clutch has been increased. Otherwise the construction of that member as well as that of the three-speed change gear set, remains practically the same as has become standardized in Maxwell practice. One marked point of structural difference between this and the smaller models, however, is the employment of a full-floating type of rear axle, instead of the semi-floating type which

THE NEW MAXWELL SPECIAL 36 HORSEPOWER TOURING CAR

eral weeks ago forecast, the mechanical construction of the line will remain substantially as heretofore. At the same time several refinements of a more or less important nature will serve to render the new cars distinctive as compared with those now current, not the least striking of these features being the new style radiator and hood which have been adopted, and which perpetuate a style which was originated for another of the United States Motor Co.'s varied products, namely the Columbia. Despite the introduction of a more conventional type of radiator, however, the thermo-syphon cooling system, which is a time-honored Maxwell characteristic, has been retained.

In the matter of body designs, too, the new cars have been brought into the way of more conventional practice, straight-line elevations, high doors, concealed latches and inside mounted control levers being the ruling feature. Furthermore, as a mark of comfort to drivers and passengers who share with them the front seats, all enclosed bodies now are to be fitted with adjustable ventilators. The equipment of the Special, which is practically the standard for the entire line, includes magneto, gas lamps, generator, two brass dash and one tail oil lamps, horn, tool kit, jack, pump, tire holder, and complete tire repair kit and tools.

The Special is to be known as the leader of the line. While following the lines

clutch and a base for the entire power plant unit is a feature which is common to all models. The engine is equipped with a new oiling system, which in several respects is decidedly original.

VIEW SHOWING ARRANGEMENT OF NEW MAXWELL OILING SYSTEM

While in reality a modified splash system, the new method of lubrication embodies the trough system of distribution, which ensures a supply of clean oil for feeding purposes at all times, and likewise provides for the filtering of the lubricant periodically, so that any particles of foreign matter are automatically removed from it. Instead of the double-bottom con-

heretofore has been used. The new Special, likewise has an I-beam front axle instead of one of tubular section.

Other specifications of the machine are 114-inch wheel base, 34 x 4 inch tires and semi-elliptic front and three-quarter elliptic rear springs. The standard width of tread is 56 inches. For the southern trade, however, a special 60-inch tread width will

VIEWS SHOWING RIGHT AND LEFT SIDES OF NEW MAXWELL SPECIAL POWER PLANT

be supplied. Double external-internal brakes on the rear wheels also are included in the specifications. The car sells for \$1,280 with complete equipment.

The Mercury model, which lists at \$1,150, is termed a "mile-a-minute" roadster. It has a flush-sided, ventilated body, Bosch racing magneto, instead of the Splidorf equipment which is used on other mem-

ber of the line, Stromberg carburetter and demountable rims. Its motor equipment consists of a four-cylinder $4\frac{1}{4} \times 4\frac{1}{4}$ inch unit of standard Maxwell construction, embodying, as a matter of course, the new oiling system. A $15\frac{1}{2}$ -gallon copper gasoline tank, mounted immediately behind the seat, is one of its features. A combined luggage trunk and tool compartment back of the tank and embodying a spare tire

rack is another striking point in its construction. Practically continuing the present model I, the Mascotte has the same style of 4×4 inch vertical motor, but has the new style flush-sided body with inside control levers. Other of its useful points are the new hood and radiator, improved Maxwell carburetter, dual ignition, "Stoddard-Dayton" spark

16 horsepower runabout, selling at the noteworthy price of \$600, and outfitted with an unusually full equipment for a machine of its size and power, the equipment consisting of top, magneto, generator, gas lamps, tools and tire repair kit. The motor is of the double-opposed type, its cylinders measuring $4\frac{1}{2} \times 4$ inches, bore and stroke.

MAXWELL MASCOTTE 25 HORSEPOWER TOURING CAR

MAXWELL MERCURY 28 HORSEPOWER ROADSTER

bers of the line, Stromberg carburetter and demountable rims. Its motor equipment consists of a four-cylinder $4\frac{1}{4} \times 4\frac{1}{4}$ inch unit of standard Maxwell construction, embodying, as a matter of course, the new oiling system. A $15\frac{1}{2}$ -gallon copper gasoline tank, mounted immediately behind the seat, is one of its features. A combined luggage trunk and tool compartment back of the tank and embodying a spare tire

and throttle control, tubular front and semi-floating rear axles, 32-inch wheels, 104-inch wheel base and the same general design of brakes and spring suspension as are employed on the new Special model. The equipment also is practically identical.

Continuing a design of power plant that has remained practically unchanged for five years, the former AB model henceforth is to be designated the Messenger. It is a

In respect to color-scheme, a distinction is to be made between the various types, instead of making a single combination suffice for the entire line. The Special will be dressed in royal green as to its body, with wedgewood green running gear. The Mascotte will have a dark blue body finish with wheels finished in battleship gray; the little Messenger is to be finished in dark blue with light blue wheels and gear.

TRUCKS FAIL TO STIR INTEREST

Chicago-Detroit Stunt Given Scant Notice
Even by Hearst's Own Paper—Few
Clean Scores Remain.

Of the fleet of 26 motor trucks which started from Chicago on Tuesday, 8th inst., en route to Detroit and return on the reliability run sponsored by Hearst's Chicago American, but eight survived to the sixth day with perfect scores; one of them, the No. 9 Poss, was withdrawn on the morning of the fourth day after a series of mishaps that cost it 376 points and the other 17 rolled up penalties varying from four to

Ind., 94.7 miles—9-Poss, 192 points, repairing cracked water jacket caused by pouring cold water in radiator when motor was overheated and work on spark plugs; 37-Van Dyke, 11 points, stopped motor to let it cool; 34-Chase, four points, stopped motor to let it cool; 39-Ideal, 10 points, cleaning spark plugs; 16-Kelly, eight points, cleaning spark plugs; 14-Dayton, one point, stalling motor; 4-Gramm, eight points, cleaning spark plugs; 27-Kirkworth, 40 points, repairing magneto and plugs.

Second day—South Bend to Ft. Wayne, 77.3 miles—9-Poss, 142 points, changing spark plugs, stalling motor, tightening magneto bolts and late at control; 37-Van Dyke, 19 points, overheated and stopping motor; 1-Gramm, 1,828 points, work on car-

shift lever; 36-Stevenson, five points, trouble in starting motor after checking out time; 14-Dayton, 13 points, stalling motor which stopped because of no gasoline; 31-Little Giant, six points, replacing spark plug, putting on driving chain that had slipped off and adjusting transmission.

The second day's run of 77 miles from South Bend to Fort Wayne, the former Indiana city having been reached on the first day on schedule time and with but few penalizations, was over only fair roads and as a result not a few of the trucks got into trouble of one kind or another, the biggest penalization of the day falling to the No. 1 Gramm which scored 1,828 points for work which was done on its carburetter and magneto.

From Fort Wayne to Lima, which constituted the third day's run was shorter by 14 miles and but four of the cars were penalized, three of them, No. 31 Little Giant, No. 38 Clark and No. 2 Gramm, being first offenders. They got four, 136 and four points respectively, the Little Giant for changing spark plugs, the Clark for work on magneto and plugs and the Gramm for replacing nuts on spring clips. The roads were slightly better than they were on the previous day though some little apprehension was caused by the apparently weak bridges which it was necessary to cross.

Fifteen miles out of Lima on the fourth day's run to Toledo, a distance of 82.8 miles, the Poss entry was withdrawn, leaving 25 of the 26 original starters still in the going. No more clean scores were spoiled during the day though the Little Giant again got into trouble, 20 points being charged for adjusting the coil vibrators and the Dayton was charged four points for work done on a leaky gasoline pipe. The roads which were encountered between Lima and Toledo were the best that had been traversed and some of the trucks made record time, not a few of them getting into control by noon and all of them completing the distance by six o'clock, when the time limit expired.

In Detroit, which was reached a little after noon on the fifth day, the contestants were met by a delegation from the Wolverine Automobile Club. But two trucks received additional penalties on the comparatively short jump of 59 miles and the following showed clean slates at the half-way mark: 10-Buick, 11-Buick, 30-Owoso, 20-Lauth Jurgens, 23-Le Moon, 6-Hewitt, 36-Stevenson, 32-Federal, 13-Mais, 24-Lincoln and 17-Kelly.

During the sixth day, which really was the seventh, as the whole of Sunday was spent in Detroit, three more clean scores were soiled, the 73 miles run from Detroit to Jackson proving so universally fruitful of penalties that seven scores were altered. The No. 24 Lincoln, the Lauth Jurgens and the Stevenson were the perfect score trucks which were set back and they received four, 22 and five points respectively, one for tardiness, the others for adjustments.

THE CONTESTING TRUCKS PARKED IN DETROIT

1,828 points, the big mark going to the No. 1 Gramm and the small one to the No. 24 Lincoln.

The run of 65.9 miles between Jackson and Kalamazoo, which was made on Tuesday, the seventh day of the run, was practically uneventful, all of the trucks reaching the checking in place on time. From Kalamazoo to South Bend, 68.7 miles, likewise was devoid of interest, the fairly good roads encountered contributing little to the list of penalizations. Today (Thursday), the last leg of the run, from South Bend to Chicago, a distance of 96.7 miles, will be essayed, and the contest will be finished at the Windy City tonight.

The contest scarcely may be said to be setting the country on fire; little if any was caused by the entry of the trucks into Detroit, or for that matter into any other city or town. Even in Chicago, where the run had its inception, little enthusiasm is apparent, and the newspaper which ostensibly has the contest in hand has devoted very little attention or space to it.

The score at the end of the sixth day is as follows:

First day—Chicago, Ill., to South Bend,

buretter and magneto, and late at control; 14-Dayton, four points, repairing fan belt; 33-Chase, six points, changing and repairing spark plugs; 5-Modern, 34 points, repairing broken fan belt.

Third day—Ft. Wayne to Lima, O., 63.3 miles—9-Poss, 142 points, replacing spark plug, repairing throttle control lever and late at control; 38-Clark, 136 points, work on magneto and plugs; 2-Gramm, four points, replacing nuts on spring clips; 31-Little Giant, four points, changing spark plug.

Fourth day—Lima to Toledo, 82.8 miles—9-Poss withdrawn; 14-Dayton, four points, repairing leaky gasoline connection; 31-Little Giant, 20 points, adjusting vibrators on ignition coil.

Fifth day—Toledo to Detroit, Mich., 59.2 miles—39-Ideal, four points, adjusting carburetter control rod; 31-Little Giant, two points, replacing spark plug.

Sixth day—Detroit to Jackson, 73.9 miles—24-Lincoln, four points, replacing fan belt; 37-Van Dyke, 27 points, stalling motor and late at control; 20-Lauth Jurgens, six points, replacing manegto control connection; 30-Owoso, 22 points, work on gear

CORBINS RETAIN CHARACTERISTICS

One Model Eliminated, But Others Afford
Seven Selections—Refinement of
Details Constitute Changes.

In making known the details of the Corbin cars which are to be produced for the 1912 demand the Corbin Motor Vehicle Corporation, of New Britain, Conn., indicates a continuance of its well-tried policy of building according to the approved principles and trusting to the merits of stable design rather than to seek the market which follows the illusive trail of sheer novelty. As a subsidiary of the giant

power touring car, which in many respects would seem to be the best appealing member of the line, and which is listed at \$3,000, is sold fully equipped, even to the top with curtains and boot, adjustable rain vision windshield, Warner speedometer, magneto, storage batteries, tire holders, headlights and Prest-O-Lite gas tank, combination oil and electric side and tail lamps, Firestone "Q. D." demountable rims and truck rack—the latter being an addition to the equipment of the present model 40.

The 30 seven-passenger touring car selling for \$3,050, the four-passenger small tonneau, which is listed at \$3,000, and the \$3,100 topedo complete the offerings which are produced in the larger model. In addition to the 30 roadster already mentioned

shaft bearings through a passageway that is cored out of the upper section of the crank case. From the bearings a certain proportion of the oil finds its way to the connecting rod bearings through the passages in the crank shaft, while the overflow from the "big ends" of the rods is thrown out by centrifugal force in the form of a spray, which is distributed over the cylinder and other surfaces that require oil. The surplus lubricant drains back into the base, to be re-circulated by the pump.

The cylinders, which are cast in pairs, are of T-head formation and are provided with ample cooling areas. The crank shaft journals are two inches in diameter and are mounted in plain bearings of unusual length. A well-designed base casting forms

CORBIN 30 NEW TWO-PASSENGER ROADSTER

CORBIN 40 SEVEN-PASSENGER TOURING CAR

American Hardware Co., and one of the older concerns engaged in the automobile business, Corbin methods and Corbin cars long have been known because of the quiet but persistent efforts that have been back of them. But two models are to be produced henceforth instead of the three which now are current; the model 18, which is really a combination of certain features of both of the other models that have been produced, being abandoned in favor of the two more distinctive types. These are models 30 and 40, the numerical designations also expressing the horsepower output of the two respective chassis.

Furthermore it is noteworthy that both types practically are to be reproduced, only such minor alterations being introduced as actual service in the field have indicated as likely to bring out definite improvement in the way of serviceability. At the same time a conservative multiplication of types through the adaption of various bodies to the two chassis enables the company to produce seven different vehicles ranging in price from \$2,000 to \$4,000. Among these is included the new two-passenger model 30 roadster, which is a neat and attractive enclosed vehicle on semi-torpedo lines, which has a large gasoline tank mounted on the deck behind the seat, a spacious trunk and spare tire carrier. Outfitted with magneto, tools, head, side and tail lamps, it sells for \$2,000. At the other end of the line is the model 40 limousine, which sells for \$4,000. The five-passenger 40 horse-

power touring car which also sells for \$2,000 including equipment.

The smaller of the two models has a 115-inch wheel base and is equipped with 34x4-inch tires. It is fitted with a four-cylinder vertical motor with cylinders of 4½x4¼-inches dimensions. The valves are placed side by side and operated from a single cam shaft. The entire cam shaft assembled is distinctive in that it is housed in a separate compartment of the crank case and is arranged so that it can be detached bodily if necessary. The crank shaft is mounted on three plain intermediate bearings and two F & S annular ball end bearings. A peculiar feature of the construction is the placing of the lower halves of the three inner bearings in the lower section of the case which serves also as the oil basin, while the end bearings only are supported from above, thus serving to retain the shaft in position when the lower section is removed for purposes of repair or adjustment. Selective three-speed gear-set, shaft drive and semi-floating axle construction complete the transmission, the master clutch which controls the power being of leather-faced cone type.

The 40 model has a 4¾x5½-inch motor, 120-inch wheel base and 36x4-inch tires. The engine is distinguished by a constant-flow lubricating system in which the splashing of oil by the cranks is entirely done away with. A gear pump serves to raise the lubricant from the engine base and causes it to be distributed to the main crank

shaft bearings through a passageway that is cored out of the upper section of the crank case and serves to support the two cam shafts as well as the engine auxiliaries, namely the magneto, circulating pump and carburetter. The timer of the double ignition system is mounted at the top of a vertical shaft which is conveniently located between the two cylinder groups.

A leather-faced cone clutch, three-speed selective change gear mechanism, shaft drive and full floating rear axle, are other features of the power plant and transmission systems. The axle, it should be added, is of exclusive design, consisting of two pressed steel vertical sections, which are united by the autogenous welding process to form a single and practically monometallic structure. The differential and driving gears are supported on a semi-steel casting which affords them rigid support and which also has the merit of permitting the entire group to be withdrawn from the housing without disturbing the adjustment of the gears.

"Auto Trucking" Performed by Horses.

Of many curious anomalies to be found in New York none are more curious or befuddling than horse-drawn trucks bearing the sign "Auto Trucking Co." The apparently inexplicable contradiction is made clear only when the trucks happen to be loaded with new motor cars which the company makes a specialty of transporting to and from railroad freight depots and steamship piers.

TESTS THAT INFLUENCE BUYERS

Unusual Demonstrations Required When Business Vehicles Are in View—Chicago Stunt for "Trouble Wagon."

When a pleasure car is in view the prospective purchaser usually is content with a test of its hill-climbing capacity, but when a business vehicle is concerned buyers are prone to require unusual demonstrations to decide their choice before placing an order. This is particularly noticeable when they are seeking a vehicle to be used as a "trouble-wagon," that is, one designed to be sent out to tow in other

gers, which gave the Abbott-Detroit the necessary grip on the ground, he performed the feat and for good measure the truck was towed around the block to the garage. As a result the Abbott-Detroit has been added to the fleet of motor cars maintained by the Chicago merchants.

Extent of the Australian Market.

Imports of automobiles into Australia have increased by leaps and bounds during the past few years, no less than \$3,951,245 worth of chassis and bodies having been shipped to the Island Continent during 1910. Of this amount \$3,471,230 represented the value of the chassis, while the bodies were valued at \$480,015. The United States supplied \$436,350 in chassis and complete cars,

"REGULATION" THAT WOULD RUIN

Investigation of London Taxicab Conditions Results in Report Favorable to Drivers—Owners Fear Outcome.

Preliminary steps looking toward the re-adjustment of London taxicab conditions on the basis of government control are not favorably regarded by the operators. A special departmental committee which has made a painstaking investigation of the situation has handed up to the Home Secretary a series of nine recommendations which largely favor the cause of the chauffeurs. The Home Secretary, however, has no power to enforce the recommendations, nor is it likely that the operators will be particularly prompt in adopting the suggestions. That the findings of the committee may form the basis of future legislation, however, is causing some apprehension among cab owners.

The recommendations, briefly, are to the following effect: That the tariff remain unchanged; that all "extras" be taken by the drivers; that the drivers' proportion of the earnings be 20 per cent. of the first pound and 25 per cent. of all amounts in excess of one pound; that the necessary gasoline be supplied to drivers by the owners at a fixed rate of eight pence, or about 16 cents a gallon, regardless of fluctuations in the market; that there be no limitations on the total numbers of cabs or drivers licensed; that special licenses be required for distant suburbs; that the motor tax of £2 2s, or about \$10.50, be abolished or reduced; that one form of standard license be employed for drivers, and that the present license qualifications be maintained.

The investigations of the committee, which was composed of Sir Archibald Williamson, Bart., Sir Clarendon Hyde and Col. Edwards, C. B., have embraced a thorough study of London's entire traffic problem and have taken into account the probable competitive influences existing between the cabs and the "tube" and tram traffic. The endorsement of the present rate of minimum fare, 16 cents for the first half mile or fraction, has been made in the face of a vigorous protest on the part of cab owners and traction experts to the effect that it should be raised to ten pence, or 20 cents; while the operators' attempt to secure effective regulation of the common practice of overcharging and purloining extra charges on the part of the chauffeurs has been met with the plan of turning all extras over to the men. The committee even goes the length of expressing the conviction that the police should not be "charged with the duty of debt collecting." Thereby, the owners believe, what small chance of protection from unscrupulous drivers the public now has would be removed.

TRUCK-HAULING TEST THAT EFFECTED A SALE

trucks which have met with mechanical mishap, or render assistance to other "lame ducks," and not unfrequently the decision hinges on a feat which never is likely to occur in the service in view. As an instance, the head of the purchasing department of Marshall Field & Co., Chicago, Ill., recently let it be known that he was in the market for a "trouble wagon," he specified that it must be capable of towing a five-ton truck up a rough 10 per cent. grade in the railway freight yards of that city, which itself is as level as a table. The grade selected is about 200 feet long and made rough by deep ruts. A. H. Sackett, sales manager of the Centaur Motor Co., Chicago agent for the Abbott-Detroit, accepted the conditions and with an Abbott-Detroit "30" made the test.

Three trials were necessary, the first two failures being due to the fact that the car could not get traction in the ruts, but when Sackett loaded the car with passen-

and \$59,530 in separate bodies. The total imports of chassis were distributed over the various countries as follows:

Imported from	Value.	Per Cent. of Total.
United Kingdom	\$1,732,415	49.0
Canada	241,440	7.1
Belgium	132,870	3.9
France	684,975	19.6
Germany	94,985	2.9
Italy	143,275	5.1
United States	436,350	12.3
Other Countries	4,920	0.1
Total	\$3,471,230	100.0

Heating the Hard Rubber Bushing.

Hard rubber bushings, such as frequently are employed as guides for insulated ignition wires, can be fitted to or removed from their sockets with little difficulty if slightly heated. Besides being slightly pliable when warmed, it will be found that they are less brittle than when cold and not so apt to crack if forced into a tight fit.

Another point in which the owners failed to receive the expected support of the committee, is that of regulating the drivers' working hours. Instead of taking the view that the men ought to be encouraged to work seven days a week instead of only five, as many of them now do, the committee advances the opinion that the operators should be able to get more men to fill their places during the "off" days. On this point, as well as another contention of the owners, namely, that there are now more cabs in service than the business justifies, the report expresses an attitude which, to the owners, has proved most exasperating. Says the report in this connection:

"Allowing that the driver spends say four hours in actual fare-driving, two or three hours for waste 'crawling' mileage, and the large amount of time, apparently about four hours, necessarily wasted by waiting on the ranks, and for fares, the aggregate does not, the owners contend, constitute a specially hard day's work, nor does it involve a great strain, the health of the cabmen being as a rule excellent.

"If the average driver finds that five days work a week or less enables him to earn sufficient for his needs, then the committee sees no reason to insist upon any obligation on his part to work on the sixth, but on the other hand a substitute must be found if the cab is to do its proper share of work.

"On the question of tips, there was some difficulty in obtaining accurate information. On the part of the owners there was necessarily ignorance, except in the case of owner-drivers, and on the part of the men there was naturally reticence as to their own receipts. The committee found the drivers more willing to discuss the average of drivers' tips generally than to give precise details of their own.

"The position of the proprietors is that they make no claim to the tips, and are glad that the men receive them.

"It appears to the committee that tips may be fairly computed at three shillings (75 cents) per day, apart from the extras. They are unable to look upon them merely as the gifts of a grateful and admiring public.

"If the supply of cabs is, as the men contend, in excess of the requirements of London, the truth of this will soon be manifest to those concerned."

Adjusting Driving Gear of Magneto.

When removing or adjusting the nut which holds the driving gear of a magneto in place, that gear always should be engaged with the pinion from which ordinarily it derives its motion. Otherwise it will be necessary to clamp the armature in some way to prevent its rotation, which is rather a difficult thing to accomplish satisfactorily. The chauffeurs' method, which is to wedge a screwdriver between the armature windings and one of the pole-pieces, is particularly objectionable for the reason

that it is liable to damage the windings seriously, if not to bruise the pole-piece itself, thereby affecting its efficiency as a conductor of the magnetic flux.

Warner Auto-Meter Made More Useful.

Without changing the general appearance of the Auto-Meter, except for the addition of a small knurled knob, the Warner Instrument Co., Beloit, Wis., has made an improvement in that important accessory which obviates the necessity for a considerable amount of the mental arithmetic which usually is indulged in by motorists. As shown in the accompanying illustration, the improvement comprises the addition of an extra reset to be used in conjunction with the regular trip reset mechanism,

the latter being used to turn back all four figures of the trip odometer at once and the former resetting only two of the figures, the miles and the tenths.

The new device is intended as a material help to those motorists who tour by book, many of whom prefer to deviate slightly from the printed instruction. Heretofore such deviations have necessitated more or less computation at each change of direction as given by the route card by reason of the extra mileage shown by the odometer. If, with the new Warner Auto-Meter the trip scale shows 48.6 miles and it is desired to turn it back to 35.8 miles, for instance, the regular reset is used to turn the figures to read 333.3. By means of the extra reset, the miles and tenths then are turned forward till the dial shows 335.8, the first figure naturally being ignored. Another improvement which also is shown in the illustration is the outside winding and setting arrangement for the clock. The speed indicating mechanism of the instrument remains the same as when it was put on the market eight years ago.

Blotting Paper for Testing Oils.

Along with the "millionth" patent comes the 999,999th "simple" method of testing lubricating oil. Contrary to some of the preceding methods of alleged simplicity which have required a complete edu-

cation in practical chemistry and a complete laboratory equipment for their application, method No. 999,999 requires no more elaborate equipment than a piece of white blotting paper and a steam jet. The test, which is credited to an English authority, is as follows:

Place a drop of known oil and a drop of the lubricant to be tested side by side on the blotting paper, letting the steam play on the paper. The oil which penetrates the blotting paper quickest and spreads widest over it is always the poorest and thinnest oil, as it shows by its lightness and the quick disappearance of its outer ring that it is compounded from products of very light specific gravity. If, on it being exposed longer to steam, the oil on the paper disappears entirely, the sample is composed of petroleum oil. If the oil under examination be compounded from petroleum, with an addition of lard or other fatty matter, the blotting paper will retain its translucency in the center long after the petroleum, which at first spreads rapidly over and through the paper, has disappeared.

Petroleum penetrates blotting paper faster than fatty oils do, and also spreads wider over the paper at first, but it dries off rapidly and the translucency disappears while that of the fatty oils remains. Some of the fixed or fatty oils turn rancid and when this occurs the fatty acids are set free and act detrimentally to metals. A simple test for free fatty acids in oils is to pour a small quantity of the suspected samples into a test tube with some fresh brass shavings; if the oil turns green, it is a sign of free acids in the sample of oil.

First Arrest for "Inquisitiveness."

Philadelphia, which does unusual things occasionally, has made "inquisitiveness," whatever that may be in legal parlance, an offense, and Filippo Steartori, an Italian street cleaner, has the distinction of being the first victim. A disabled automobile with a leaking gasoline tank caused the inquisitiveness which led to his arrest. The automobile belonged to George Fox, of Logan, Pa., who was endeavoring to locate motor trouble when Steartori "got busy" and reduced the touring car to a few damaged fragments of mechanism. The member of the "white-wings" force crawled beneath the car on a tour of investigation with a lighted match, and the pyrotechnical display which followed caused much excitement and brought out the fire department. Strange to say, although he thought an earthquake struck him, the broom wielder was uninjured. After being rescued from beneath the debris he was arrested upon complaint of the owner. When taken to the station house the police were puzzled as to what charge should be made. Suggestions ranging from arson to Black Hand work were discussed until finally the unique idea of "inquisitiveness" dawned upon one of them, and for the first time that charge was put upon the blotter.

992,796. Armored Tire. George D. Moore and Ralph L. Morgan, Worcester, Mass. Filed Oct. 16, 1909. Serial No. 522,973.

1. As an article of manufacture, a vehicle tire or outer shoe comprising a body composed mainly of flexible soft rubber, a plurality of rigid inserts composed of hard rubber vulcanized to the soft rubber and located at intervals along the wearing surface or tread thereof, and sheet metal members extending along the outer surfaces of the hard rubber inserts, said sheet metal members extending at opposite sides inwardly with respect to the tire and insert and in contact with the material of the inserts, whereby they are firmly secured together.

992,897. Ball Bearing Screw. Winfield S. Nichols, Newark, and James H. George, Harrison, N. J., assignors of one-third to said Winfield S. Nichols, one-third to said James H. George, and one-third to Herbert J. Skipp, Newark, N. J. Filed June 22, 1910. Serial No. 568,289.

1. As a new mechanical element, a non-friction screw and nut comprising, a screw-shank provided with screw-threads, a nut-portion adapted to receive said screw-threads of said screw-shank, said nut-portion comprising a main body-member provided with an internal semi-circular spiral groove and a vertical tubular opening providing a return-passage, said main body-member being provided with a hole or passage connecting said spiral groove with the lower end of said vertical tubular opening, a stop-pin secured to said main body-member, the inner end of which projects into said spiral groove adjacent to said hole or passage, a top retaining plate provided with means for connecting the upper end of said tubular opening with said spiral groove, a bottom retaining plate provided with a guide-pin adapted to enter the lower portion of said tubular opening, and a plurality of anti-friction balls seated in said spiral groove and capable of a rolling or traveling movement in said spiral groove, said anti-friction balls being adapted to engage said screw-threads of said screw-shank and form the bearings therefore, substantially as and for the purposes set forth.

992,920. Auxiliary Starting Device for Internal Combustion Engines. Wentworth Steele, St. Louis, Mo. Filed Nov. 25, 1907. Serial No. 403,639.

An auxiliary engine-starting device, comprising a branch pipe leading from the pipe which supplies liquid hydrocarbon to the carburettor to the intake pipe of the engine, a pump located in the first mentioned pipe, valves located in said pipe adjacent the pump, the screw-plug on one end of said branch pipe, a locking-plate at the end of said screw-plug, the intake pipe having an aperture through which the said locking plate is inserted within the intake pipe, and the nut threaded upon the screw-plug exterior of said intake-pipe, all arranged for detachably clamping said screw-plug within said aperture of the intake pipe, in combination with the curved and perforated pipe section within said intake pipe.

992,940. Safety Robe Back. Donald I. Burton, Asbury Park, N. J. Filed April 21, 1910. Serial No. 556,845.

1. A rack of the character described, comprising spaced standards formed at their ends with angularly disposed brackets by which they may be connected to a support, upper and lower movable bars extending in parallel relation to each other from one standard to the other, sleeves connected to one end of the respective bars and arranged to slide on the standards, and spring latches carried by the sleeves, the standards being formed with notches for engagement by said latches.

992,949. Annular Roller Bearing. Samuel S. Eveland, Philadelphia, Pa., assignor to Standard Roller Bearing Company, Philadelphia, Pa., a Corporation of New Jersey. Filed Aug. 5, 1908. Serial No. 447,037.

An annular roller bearing comprising an inner ring provided with a conical roller surface and at one edge with an outwardly projecting flange having an outwardly beveled abutment or working side, an outer ring concentric with the inner ring and provided internally with a conical roller race surface, conical rollers arranged between the races and having their larger ends chamfered to conform to and ride on the outwardly beveled working side of the flange, and a cage consisting of connecting rods and of large and small conical rings each having confronting projections provided with conical side walls constituting roller pockets and the larger end ring being internally cut away or rabbeted to expose the larger ends of the rollers and receive the flange on the inner cone.

992,967. Driving Gear for Motor Vehicles. Harry Edgar Lever, Johannesburg,

WANTS AND FOR SALE

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

USED CARS THAT MERIT YOUR CONSIDERATION—We are offering some very attractive propositions in '08, '09 and '10 five and seven passenger four and six cylinder, Thomas cars; factory rebuilt and refinished, and backed by our guarantee. Also some earlier Thomas models as well as cars of other manufacture. Obtain our prices—they are sure to interest you. Personal inspection invited. Inquiries will receive prompt and courteous attention. Used Car Department, E. R. THOMAS MOTOR CAR CO., 1200 Niagara St., Buffalo, N. Y.

FOR SALE—1911, 6-48 Pierce-Arrow roadster, thoroughly overhauled and painted. Full tool and lamp equipment, new tires. At a bargain if taken at once. Address PIERCE-ARROW, Box 649, New York.

WE REQUIRE several more first-class engine assemblers on high grade work. Steady employment to good men. F. I. A. T. AUTOMOBILE CO., Poughkeepsie, N. Y.

TIRES THAT WON'T RIM CUT

That's Goodyear Detachable Auto Tires. It's the design and construction that permits us to guarantee our tires against rim cutting.

Goodyear Detachable Auto Tires are used by over 40 of the best automobile manufacturing companies in the country. They positively won't creep or come off the rim in use. Send for our free book, "How to select an auto tire." It's brimful of interesting tire talk.

Transvaal. Filed Jan. 5, 1910. Serial No. 536,583.

1. In a driving gear for motor vehicles, in combination, a main transmitting shaft and a secondary transmitting shaft axially alined with said main transmitting shaft, a gear fixed to the main transmitting shaft a further gear fixed on said main transmitting shaft, the latter gear having a conical recess eccentric to both shafts, a clutch member slidably arranged on the secondary transmitting shaft, said clutch member having a conical projection or boss eccentric to both shafts and adapted to clutch the secondary transmitting shaft to the main transmitting shaft through the second gear, a gear fixed on the secondary transmitting shaft, three other shafts arranged parallel with the main and secondary transmitting shafts, a gear loosely mounted on one of said shafts, said gear meshing with the gear fixed to main transmitting shaft, a further gear loosely mounted on shaft, one of the three last mentioned shafts, said further gear meshing with the gear on main transmitting shaft, the gears having conical opposing recesses eccentric to the shaft, a clutch member slidably arranged on the shaft between the gears, said clutch member having conical projections or bosses eccentric to the shaft and adapted to clutch either of the gears to shaft, a further gear fixed on the shaft and meshing with a gear on secondary transmitting shaft, a gear loosely mounted on shaft, the second of the three parallel shafts, said gear meshing with the gear fixed on the main transmitting shaft, said gear having a conical recess eccentric to its shaft, a clutch member slidably arranged on the shaft, said clutch member having a conical projection or boss eccentric to the shaft and adapted to clutch said gear to the shaft, a further gear fixed on the shaft, a gear on the idler shaft, said gear meshing with a gear on the second parallel shaft and a gear on the secondary transmitting shaft, as set forth.

993,007. Clutch. Harvey J. Wells, Peru, Ind. Filed July 16, 1910. Serial No. 572,300.

1. The combination with a driving casing and a driven shaft extending into the casing, of clutch members mounted within the casing, an expansible element for shifting said members into frictional engagement, a housing revoluble with the casing and movable axially relative thereto, means slidably mounted on the shaft for expanding said element and connected to said housing for axial movement therewith, and springs adjacent the housing and normally bearing thereagainst to hold said housing normally in a predetermined position.

993,043. Vehicle Wheel. George W. Dudley, Staunton, Va., assignor of one-fourth to James W. Sheets, Jr., Staunton, Va. Filed Dec. 24, 1910. Serial No. 599,219.

1. In a device of the character described, the combination with an axle, of a wheel mounted thereon embodying a sectional hub disposed upon opposite sides of the wheel proper, said wheel proper being radially movable between the hub sections when subjected to abnormal pressure, each of said hub sections having a longitudinal annular chamber therein, an annulus movably arranged in each of said chambers, resilient rings arranged in the chamber of each hub section and acting to force the annulus therein into engagement with the wheel proper to yieldingly sustain the same in concentric relation to the wheel axle, a circular plate in each of the hub chambers, and adjusting screws to force said plates against the resilient rings to regulate the pressure thereof upon the annuli carried by

the hub sections in accordance with the load carried by the vehicle.

993,079. Transmission Gear. Charles M. Leech, Lima, Ohio. Filed April 30, 1910. Serial No. 558,550.

1. In an apparatus of the character described, a driving shaft, a disk, a plurality of driven shafts arranged in end to end relation to each other, means for imparting rotation from the driving shaft to one of the driven shafts, means for imparting rotation from one of the driven shafts to the other driven shaft, a clutch device slidably mounted upon one of the driven shafts and provided with means to rotate said disk, a gear loosely mounted upon the last named driven shaft to rotate said disk at a different speed, said clutch device serving to lock said gear to its shaft, and a gear mounted upon the other driven shaft to rotate said disk in an opposite direction.

993,088. Vehicle Wheel. James Garrow McAlpine, Gilroy, Cal. Filed July 27, 1909. Serial No. 509,879.

A wheel having a hub, a felly, a rim removably mounted on the felly, felly-holding spokes with their outer ends engaging and extending into the felly and with their inner ends extending into the hub and provided on one side with helical grooves, rim-holding spokes with their outer ends extending through the felly and into the rim and with their inner ends extending into the hub and provided with helical grooves on the side opposite from the grooves in the felly-holding spokes, a plate rotatable on the hub and against the inner ends of the spokes on each side, one of said plates having helical threads fitting the corresponding helical grooves in the felly-holding spokes and the other end of said plates having helical threads fitting the corresponding helical grooves in the rim-holding spokes, and means for clamping the plates in position on the hub and against the inner ends of the spokes.

993,092. Spring Wheel. Francis J. Millea, Springfield, Mass., assignor of one-half to himself, one-fourth to John E. Stannard, and one-fourth to George W. D. Upton. Filed Oct. 20, 1909. Serial No. 523,671.

1. In a spring wheel, a recessed hub having a plurality of lugs, the recesses in such hub each being bowed, a rim provided with inwardly-projecting members, a plurality of pairs of spring units arranged so that each pair assumes an approximately heart-shaped outline or configuration, means comprising binding blocks receivable in said recesses and bolts tapped into said lugs to engage said blocks to secure the inner terminal portions of said units in said recesses, and means to attach the outer terminal portions of said units to said inwardly projecting members.

993,159. Leather Tire. Raymond J. Elledge, Los Angeles, Cal. Filed Aug. 19, 1907, Serial No. 389,300. Renewed May 16, 1910. Serial No. 561,769.

The combination of a flanged tire having an annular groove around its tread formed with a convex bottom and curved side walls diverging outwardly from the top to the bottom of the groove, of a series of tread pieces arranged side by side therein transversely of the groove and having their end and bottom edges corresponding with the side walls and bottom respectively of the groove, whereby said pieces are caused to fit said groove and fill the same, wires through said pieces circumferentially of the wheel, one near each end thereof, and bolts through said pieces transversely of the

wheel and through said flanges, said bolts being between the bottom of the grooves and said wires.

993,210. Carburetter. Arthur J. Weiss, West Orange, N. J., assignor to Edward A. McCoy, East Orange, N. J. Filed July 19, 1910. Serial No. 572,731.

1. In a carburetter, a throttle valve, a fuel supply channel, a valve therefor, said valve comprising suction-actuated means, a passage leading from said suction-actuated means to the opposite side of said throttle valve, and a check valve in said passage.

993,222. Tire Tread. Nahum Judson Busby, Boston, Mass. Filed Apr. 15, 1910. Serial No. 555,659.

An integral tire, comprising a main or body portion formed of an admixture of a quartz like substance and rubber, and a base composed wholly of rubber, said portions merged in a homogeneous body without a definite line of demarcation.

993,233. Horn for Cycles, Motor Cars, and the Like. Albert Henri Feugueur, Paris, France. Filed Sept. 29, 1910. Serial No. 584,561.

1. A warning horn comprising in combination a bulb, an air distributing valve connected therewith, a casing for the said valve, a series of cornets attached to the said casing and adapted to be brought successively into connection with the bulb by the rotation of the said bulb and valve.

993,236. Vehicle Spring. Will Friedrichsen, Miles, Iowa. Filed an. 18, 1911. Serial No. 603,327.

1. An elliptic spring comprising complementary sections provided at their ends with pairs of ears which are transversely apertured, the ears of one of the sections fitting snugly between the ears of the other section, a fastening pivotally connecting the sections by passing through the registering openings of the ears thereof, and a roller mounted upon said fastening, said roller being spaced from the adjacent side of the lower section and obtaining a bearing against the adjacent side of the upper section of the spring.

993,287. Vehicle Cushioning Device. Percy E. Barker, Buffalo, N. Y., assignor to Burnette F. Stephenson, Detroit, Mich. Filed Aug. 10, 1910. Serial No. 576,542.

1. The combination with a vehicle body and its axles of a cushioning device comprising gear segment disks rotatably mounted on said vehicle body, a gear pinion rotatably mounted between, and meshing with said disks, and rods pivotally mounted at their upper ends on said disks and at their lower ends on one of said vehicle axles.

993,332. Vehicle Wheel. Arthur W. Abernathy, Champaign, Ill. Filed Sept. 26, 1910. Serial No. 583,791.

A vehicle wheel of the class described comprising an outer rim provided in its inner edge with a continuous circumferential channel provided in its inner walls with oppositely disposed radial recesses, a continuous series of coil springs mounted in the channel of the rim and projecting into the recesses above mentioned, a solid outer tire for the rim, a bearing ring, provided in its outer periphery with a plurality of inwardly extending slots, said ring extending into the channel of the rim and bearing against said springs, and pins passing through the outer rim and the slots of the bearing ring to prevent the bearing ring from creeping on the outer rim when the wheel is in motion.

No. 9

SOLID TIRE STANDARDS TO RULE

Society of Automobile Engineers Promulgates Dimension Specifications—Meeting Ready Acceptance.

Convinced of the soundness and practicality of the standard tire and wheel dimensions for demountable and non-demountable solid motor tires that were passed last spring, the Society of Automobile Engineers has now come out in public espousal of them, and is receiving ample encouragement to entertain the view that they will be generally accepted in the trade. The specifications standardize the use of a permanent steel band over the wood wheel and stipulate the dimensions of the band and felloe for a given nominal diameter sectional size of tire, as well as tolerance or allowable variation from exact size. Standard flange dimensions and standard bolt sizes and bolting spacings are now being considered and will be fixed as soon as possible.

When the results of the work of the committee having the matter in hand were made known last May there were objections raised in some quarters that the suggested standards would not prove wholly satisfactory, particularly in the matter of tolerance. It was indicated by the maker of a metal base tire that the tolerance allowed by the S. A. E. specifications was greater than need be and would interfere with the satisfactory application of his product. On the other hand, the rim makers stated that to produce rims to closer limits than those allowed— $1/16$ inch plus and minus on the exact circumference of the band—it would be necessary to resort to double rolling, against which the wheel makers would raise strong objection. The makers of steel wheels, which are being taken up by some truck manufacturers, also are in favor of the tolerance allowed by the specifications.

Assurances have been given the Society

that the standards which it is officially promulgating are both satisfactory and welcome, and already a number of the largest makers of trucks have taken steps to put the standards into effect on their trucks by the first of next year. Accordingly the wheel makers are adopting or are preparing to adopt the standards, and the tire manufacturers as a whole have not shown any disposition to balk at supplying the sizes that the standards demand. The effect will be to bring about a complete interchangeability between the different makes of solid motor tires. The Society also is taking up work toward bringing about a standardization of the essential dimensions relating to demountable rims for pneumatic tires.

Rajah Brings Suit Against Kreitlein.

Injunction and infringement proceedings have been brought by the Rajah Auto Supply Co., of Bloomfield, N. J., against George F. Kreitlein, of the Dealers' Auto Supply Co., Indianapolis, Ind., in the Federal court in that city. The complaint alleges that Kreitlein is making and offering for sale spark plugs similar to those made by the Rajah company and infringing the latter's patent rights. In addition to the injunction, damages to the extent of \$10,000 are asked for.

Detroit to Have Another Foundry.

Among Detroit's newest companies related to the automobile industry, the Motor Foundry Co. is building in that city a large foundry on Hart avenue and the Detroit terminal. The building is 100 x 180 feet and is to cost about \$18,000. It is to be completed in 30 days. J. A. Gey and J. H. James are moving spirits in the concern, which will specialize in gray iron automobile parts.

Lexington to Enlarge Its Factory.

The Lexington Motor Car Co., of Connersville, Ind., is making arrangements for the building of an addition to its present plant. The new wing is to afford 35,000 square feet additional floor space.

HUPP CORPORATION IN GASOLENE

Will Make the "R. C. H.," Following Hupp's Retirement from Hupmobile—Sales Managers Visit Factory.

Still another gasoline car is to have its home in Detroit, Mich., and the Hupp Corporation, of which Robert C. Hupp is the head, is to make it. The car will be known as the "R. C. H.," a name taken, as will readily appear, from Hupp's initials. This will avoid any confusion of the car with the Hupmobile, made by the Hupp Motor Car Co., of which Hupp until recently was president and general manager, but from which he has withdrawn, following the purchase of his interests by some of the larger stockholders.

The Hupp Corporation, to which Hupp will devote himself, has been making the Hupp-Yeats electric, but by the manufacture of the "R. C. H." will enter the gasoline field as well. The concern already is well developed in the manufacture of gasoline automobile parts and accessories, so that the production of gasoline cars requires but little revolution in the nature of its equipment. The first of its models of the gasoline type will be a runabout in which the extensive use of drop forgings and nickel steel construction will be featured. The motor is of the long stroke type. Complete with lamps, top, windshield and other accessories, it will sell for \$700. Present plans provide for the manufacture of 500 of the cars before the first of the year. Other models are to be developed and added, and it is probable that the company will also take up the manufacture of commercial cars in both electric and gasoline types.

Announcement of the "R. C. H." car was made to the branch sales managers of the Hupp Corporation at their gathering in Detroit on the 21st inst., during their two days' visit at the plants of the corporation in Fairview. Monday's program for the

visitors was chiefly given over to an inspection of the company's various manufacturing departments, including the foundry, the machine department, the drop forging plant, the assembly department and the like. Events concluded with a dinner in the evening at the Pontchartrain, at which the branch managers and various department heads were present, including R. C. Hupp, L. G. Hupp, Harwood M. Bacon, sales manager, and the following branch managers: J. W. McCrea, Detroit; L. A. Root, Minneapolis; E. N. Stinson, Philadelphia; H. D. Haupt, Cleveland; C. H. Batchelor, Chicago; J. O. Harris, Los Angeles; C. E. Christian, Kansas City; R. W. McMullen, Buffalo, and E. W. Swanbrough, Denver.

Hupp's Retirement Advances Hastings.

Charles D. Hastings has been appointed general manager of the Hupp Motor Car Co., of Detroit, Mich., to succeed R. C. Hupp, who has sold his holding to a syndicate of the stockholders and has resigned to devote his entire attention to his other interests. These latter include the Hupp Corporation, of Detroit, which makes the Hupp-Yeats electric cars, and which is to enter the gasoline field. Hastings has been with the Hupp Motor Car Co. as assistant general manager since its inception, and has always been active in its executive affairs, so that Hupp's retirement will in no way affect the plans or policy of the company. He was connected with the Olds company before the Hupmobile came on the market. E. A. Nelson, designer of the Hupmobile, remains at the head of the Hupp Motor Car Co.'s engineering department, and the personnel of officials of the concern remains unchanged, save for Hupp's retirement.

Homo Revived in Philadelphia.

Apparently with the purpose of reviving the Homo device, which when introduced between the carburetter and the engine effects a more thorough mixing of the fuel and air, a new company, styled the Homo Company of America, has been incorporated under Delaware laws, with \$165,000 capital. The concern has its headquarters in Philadelphia, and its incorporators include H. C. Griffiths, W. W. Power, F. L. Houghtaling and E. Leonard. The Homo mixer was formerly made by the Gasoline Motor Efficiency Co., of Jersey City, N. J., which dropped from sight many months ago.

Otto Wants \$100,000 from Mount Holly.

Offers have been made by the Otto Automobile Sales Co., of Philadelphia, Pa., to establish a plant in Mount Holly, N. J., for the manufacture of Otto cars, provided the residents of that place will subscribe for \$100,000 worth of stock in a new \$500,000 corporation that would be formed. Representatives of the company recently addressed a public meeting at Mount Holly on the subject.

Changes Among Prominent Tradesmen.

Al. C. Bergmann has resigned as assistant general manager of the Fiat Automobile Co. He will join the factory organization of Wyckoff, Church & Partridge, Inc., at Kingston, N. Y.

J. C. Donahue has accepted the position of general manager of the Clark Motor Car Co.'s factory in Shelbyville, Ind. He hails from Pittsburgh, Pa., where he has the Donahue Motor Sales Agency, which handles the Clark car.

J. A. Atwell, who for the past two years has been manager of the New York City branch of the Michelin Tire Co., has been appointed manager of the Chicago branch of the Fiat Automobile Co. He assumed his new duties in the Windy City on the 23rd inst.

C. M. Kolbenstetter has become a part of the selling organization of the Stromberg Motor Devices Co., of Chicago, Ill., which manufactures Stromberg carburettors and other motor accessories. For a number of years he has handled cars and carburettors in the Central States.

A. K. McCluny, formerly a traveling representative for the Buick Motor Co., has resigned that position to go with the Westcott Motor Car Co., of Richmond, Ind. As a special district representative of the Westcott company he will control Michigan, Northern Indiana and Northern Ohio.

A. O'Donnell has been appointed manager of the New York office of the Booth Demountable Rim Co., of Cleveland, Ohio, succeeding John F. Paine. After placing several of the Booth company's other branches on a successful basis, O'Donnell has just returned from the West in order to take charge of the Eastern territory.

W. E. Dunston, M. E., becomes general manager of the Ditwiler Mfg. Co., Galion, Ohio, on the 1st of September. For some years he was chief engineer of the Dayton Motor Car Co., and has been an engineer for the Olds Motor Works, Cadillac Motor Car Co. and the Chalmers Motor Co. The Ditwiler company makes the Ditwiler steering gear.

W. F. Melhuish has been placed in charge of the taxicab sales department of the White Company, of Cleveland, Ohio. Until recently he was sales manager of the Croxton-Keeton Co., which built taxicabs exclusively. Later he held a similar position with the Consolidated Motor Car Co., after the Merger of the Croxton and the Royal Tourist companies.

L. L. Halle, who has had a number of years experience in the motor car accessory field, has joined the sales organization of the Lovell-McConnell Mfg. Co., of Newark, N. J. He will cover the Eastern States in the interests of Klaxon warning signals, Conover safe-guards and other of the company's products. R. L. Wilkinson, who has been traveling the Eastern terri-

tory, will take up similar duties for the company in the West.

General shifting in the officers of the Croxton Motor Co., of Cleveland, Ohio, has followed the retirement of H. A. Croxton as president and general manager of the company. J. P. Stoltz, formerly vice-president, has succeeded to the presidency; H. D. Michaelson, former secretary and treasurer, has relinquished the secretaryship to F. H. Smith but still is treasurer; George S. Patterson, formerly a Rambler branch manager, has succeeded W. F. Melhuish as sales manager.

Thomas J. Fay has resigned the editorship of The Automobile to become chief engineer at the plant of Wyckoff, Church & Partridge, Inc., at Kingston, N. Y., which until this month was operated at the W. A. Wood Automobile Mfg. Co. The factory makes the Guy Vaughan pleasure cars and the American editions of the English-designed Commer trucks. Fay will be succeeded by David Beecroft, of the Motor Age department of the Class Journal Co., who will divide his time between the twin publications.

A. S. Clucker and C. L. Hixson have been secured by the Garage Equipment Co., of Milwaukee, Wis., as Eastern and Western representatives, respectively, for the company, in the sale of Milwaukee and Gemco automobile parts and specialties. Clucker will have charge of the Eastern territory, making his headquarters in New York City, where he will open an office after the 1st of October. Hixson will have the territory west of Chicago and east of the Rocky Mountains, with headquarters in Chicago after the first of February.

In the reorganization of the R. L. Morgan Co., of Worcester, Mass., by which it has become the Morgan Motor Truck Co., and is once more in a position to go forward, the changes in the list of officers result in the retirement of Henry E. Whitcomb, of Worcester, his only present interest being that of a stockholder. Whitcomb, and not Ralph L. Morgan, was treasurer and general manager, these offices going respectively to Eben F. Jones and to Harry Unwin, the president of the company. Morgan remains as designer and engineer.

Gets Big Commer and Vaughan Territory.

Northern California sales control of Commer trucks and Guy Vaughan touring cars has been given to the Pioneer Automobile Co., of San Francisco, as the result of a contract executed between that company and the Western branch of Wyckoff, Church & Partridge, Inc., of New York, the manufacturers of the Commer and Vaughan cars. The territory of the Pioneer company includes the whole northern half of the state. Wyckoff, Church & Partridge, Inc., will continue a Western service department with headquarters in San Francisco, under the direction of Charles B. Shanks, the Western manager.

BIG BRANCH PLAN FOR RAMBLER

Boston, New York, Chicago and San Francisco to be Made Strongholds—Sales and Service Buildings.

Erection of large service buildings and the establishment of very complete sales and service facilities in a number of the biggest cities of the country are to form a part of the expanding sales policy of the Thomas B. Jeffery Co., of Kenosha, Wis., in the marketing of Rambler cars in the future. The president of the company, Charles T. Jeffery, has given this phase of the Rambler sales and service organization considerable attention and thought for some time, and as a consequence comprehensive plans for fortifying the company in the more important strategic centers are to be carried out.

The more immediate steps will be a big Rambler building in Boston, on Commonwealth avenue; New York headquarters that will probably be located on Broadway, a building in Chicago that will rival anything of its kind in the country, and sales and service headquarters in San Francisco, to be located at Geary and Mission streets. The Rambler announcement for 1912 has not yet been made to the trade, but something "unusual" is promised.

McCue Moves Everything to Buffalo.

Having recently acquired the big modern plant of the Superior Axle & Forge Co., of Buffalo, N. Y., by consolidation with that company, the McCue Co., of which C. T. McCue is president and general man-

ager, is closing its original plant at Hartford, Conn., where it made automobile axles and forgings, and will centralize all its manufacturing operations at Buffalo. Its factory building in Hartford will be for rent and ready for possession on the 1st of October. Such of the Hartford employees as care to go to Buffalo will be taken along.

Brooks-Latta to Make Commercial.

For the manufacture of light delivery cars, the Brooks-Latta Automobile Manufacturing Co., of St. Louis, Mo., is planning to build a one-story brick factory at Sullivan and Lambdin avenues. The concern is a new one, composed of St. Louis men, and has an experimental shop at 4225 Fairfax avenue. The company is capitalized at \$150,000. Charles E. Brooks is president, Allen T. Latta vice-president, and Charles Latta secretary and treasurer. The vehicle that the company intends building embodies several advanced features, including a sliding valve engine, an improved type of transmission and a new self-starting mechanism.

Meacham Heads Two-Cycle Concern.

T. G. Meacham, head of the New Process Raw Hide Co., Syracuse, N. Y., has been elected president of the Palmer-Moore Co., of Syracuse, and the capitalization of the company has been raised from \$25,000 to \$100,000. The Palmer-Moore Co. is manufacturing a two-cycle engine which is to be made in a form suitable for application to motor trucks. The engine is unusual in several respects, chief of which is that its speed is controlled by varying the size of the ports, while the spark timing and carburettor adjustments remain fixed.

AGENTS CLAMOR FOR 1912 CARS

Trade Outlook for Coming Year Makes Overland Hasten Factory Expansion—Bennett Gives Figures.

Proving to his mind a remarkably prosperous outlook for the automobile industry in 1912, orders for the coming year have reached so large an aggregate in the office of George W. Bennett, general sales manager of the Willys-Overland Co., Toledo, Ohio, that the company has hastened to order new automatic machinery, hurry the completion of new buildings and issue an emergency call for additional help, for the manufacture of Overland cars. According to Bennett, 18,000 cars already have been ordered by the company's agents, and it is the expectation, he declares, to sell at least 30,000 cars by the first of September.

"Since my connection with the industry," he says, "I have never seen such a scramble by dealers to secure agencies. The sales force has been literally deluged with orders from all over the country, while many of the agents came to the factory in an effort to secure an allotment even before the 1912 contracts were printed."

Robinson Goes West to Get Goats.

P. R. Robinson, president of the New York Sporting Goods Co., New York City, is on a Western hunting trip, from which he will return about the middle of September. After visiting the Yellowstone, he goes to Wyoming to hunt elk and mountain goats.

SIX MONTHS AFTER—HAYNES'S NEW FACTORY WHICH REPLACES THE ONE DESTROYED BY FIRE

Bird's-eye view of the new plant of the Haynes Automobile Co., at Kokomo, Ind. Last February the former plant was burned to the ground, but, despite rumors to the contrary, the work of production has been continued without interruption. The completion of the new buildings will permit operation to go forward at "full speed."

Quinby Sues Pennsylvania Auto-Motor.

Suit for \$14,349.50, with interest, has been brought against the Pennsylvania Auto-Motor Co., of Bryn Mawr, Pa., by J. M. Quinby & Co., of Newark, N. J., the suit being entered in the prothonotary's office on the 15th inst. The Quinby company builds bodies, but in addition to this it at one time served as a distributor for the Pennsylvania company's cars. In the statement filed it is set forth that the plaintiff contracted to build for the defendant 250 aluminum automobile bodies, which were to cost \$71,000. After a number of the bodies had been built and delivered the defendant wanted changes made, which included the addition of closed-front doors to each body. The bodies then were made according to the defendant's orders, and it is set forth that now the defendant company refuses to accept the full number according to contract. The plaintiff sets forth that because of this refusal it must lose the amount for which suit has been brought.

Will Make Net Fenders for Automobiles.

Scoop-net fenders, while not unknown to trolley cars, have not before been commercially supplied for automobiles, but a newly incorporated concern in New York City, which is to be known as the Automatic Fender Co. of America, is to undertake their exploitation. The fender consists of two nets carried by frames under the forward part of the car, ready for release to scoop up a fallen pedestrian when the driver of the car sees the necessity for doing so. The directors of the new company include William E. McGuirk, manager of the American Taximeter Co.; Gerard J. Kluyskens, manager of Ducasse & Co.; Saul S. Meyers, a New York attorney, and S. S. Weyl. William E. Lowther is one of the incorporators, with McGuirk and Meyers.

Will Make Evans Motors and Cars.

The Automobile Mfg. & Engineering Co., of Detroit, Mich., from modest beginnings has entered on a larger activity and has increased its capitalization to \$50,000. The following officers have been elected: S. F. Lockwood, president; J. P. Gallagher, vice-president; R. H. Evans, secretary, and T. F. Ferguson, director. The concern is at 130 Josephine avenue. Its products for 1912 will be the Evans motor, which is a 32 horsepower two cylinder type, and the Evans Limited commercial car.

McKinney Making Motor Cultivators.

The McKinney Traction Cultivator Co., of St. Louis, Mo., has located its new manufacturing plant at Main and St. George streets, where it is installing complete machinery equipment for the making of McKinney traction cultivators. The factory is 102 x 148 feet, with two floors and a basement. It is situated alongside

the Iron Mountain railroad tracks. Deliveries of the traction cultivators are expected to commence about the first of November.

Lion Concentrates at Adrian Lair.

The Lion Motor Car Co., of Adrian, Mich., has moved its entire sales force from Detroit, giving over its show rooms, garage and offices at 650 Woodward avenue to the Lion "40" Agency, under the management of Harry Postal. S. H. Humphrey, recently appointed factory manager at Adrian, has assumed his new duties, and the advertising department will hereafter be under the management of J. A. Thorson, formerly with the Brush Runabout Co.

Packard Produces a Lighter Truck.

Supplementing the representation it already has in the commercial field with its three-ton truck, the Packard Motor Car Co., of Detroit, Mich., has brought out a lighter and faster model for a normal load of 3,000 pounds. The motor is 26.4 horsepower, A. L. A. M. rating, and the chassis is furnished in two lengths of wheel base, 10 feet and 12 feet, respectively.

Lewis and Bate Sail for Europe.

William Mitchell Lewis, president of the Mitchell Motor Car Co., Racine, Wis., and J. W. Bate, designer and factory manager for the company, sailed this week on the Mauretania in the interests of their European business, which has greatly expanded during the past two years. They will be gone about six weeks.

Opel's Unlucky Factory Fire.

Fire on the night of the 19th inst. destroyed the greater part of the immense plant of Adam Opel, at Russelsheim, on the lower Main, Germany, where Opel automobiles are made, together with bicycles and sewing machines. Two persons perished in the flames. The loss is estimated at about \$1,250,000.

Goggle Glass Duty Reduced.

Plain bent glass pieces for motor goggles are not dutiable at 45 per cent, but can come in at 1½ cents a pound and 5 per cent ad valorem, according to a decision by the Board of United States General Appraisers, at New York. The decision was on appeal by the American Thermo Ware Co., and reverses the 45 per cent decision made originally by Collector Loeb.

Conklin to Acquire Bell Carburetter.

By reorganizing the Bell Carburetter Co., of Aurora, Ill., and changing its name to the Conklin Automatic Carburetter Co., what is practically a new company for Aurora is to be created. The capital stock of the concern is to be increased to \$50,000, and the manufacture of a new carburetter, known as the Conklin automatic, will be undertaken on a large scale.

Flint, Mich.—Mason Motor Co., under Michigan laws, with \$100,000 capital; to manufacture and deal in automobiles.

Spokane, Wash.—Clark Carburetor Co., under Washington laws, with \$200,000 capital; to manufacture carburetters. Corporators—E. H. S. Pope, A. W. Nintz, C. B. Laughlin.

East Orange, N. J.—Motor Truck Sales Co., under New Jersey laws, with \$15,000 capital; to manufacture automobiles and other motor vehicles. Corporators—H. S. Decker, Walter P. Maccabe, M. Zagat.

Chicago, Ill.—Simplex Auto Cranker Co., under Illinois laws, with \$100,000 capital; to manufacture and deal in automobiles and machinery. Corporators—Edwin A. Gardner, Ignatius F. Halton, Willard Patrick.

Columbus, Ohio.—Eastern Automobile Co., under Ohio laws, with \$10,000 capital; to manufacture and deal in automobiles. Corporators—Jacob Goldstein, J. E. Lacey, F. F. Cain, W. C. Adams, Charles Sylcester.

Brooklyn, N. Y.—Mohr Auto Co., under New York laws, with \$25,000 capital; to manufacture automobiles and automobile parts. Corporators—H. Mohr, M. Keve, of Brooklyn; C. Goldstein, of New York City.

Chicago, Ill.—Automobile Construction Co., under Illinois laws, with \$27,000 capital; to manufacture gasoline commercial and pleasure vehicles. Corporators—Harry M. Wells, Albert T. Graham, William E. Fuller.

Paterson, N. J.—Eastside Auto Repair Co., under New Jersey laws, with \$20,000 capital; to construct and repair motor vehicles, engines, etc. Corporators—Veron Ettinger, Matthew Weinstein, Chester C. Boggs, all of Paterson.

Philadelphia, Pa.—Homo Co. of America, under Delaware laws, with \$165,000 capital; to manufacture automobile specialties. Corporators—H. C. Griffiths, W. W. Power, F. L. Houghtaling, of Philadelphia; E. Leonard, of New York City.

Toledo, Ohio.—The Electric Auto-Lite Co., under Ohio laws, with \$100,000 capital; to manufacture and deal in electric light appliances for automobiles. Corporators—Claud L. Lewis, Sherman L. Kelly, J. A. Barber, O. M. Haynes, P. F. Zeiger.

Increases of Capital.

Chicago, Ill.—Auto Parts Co., from \$50,000 to \$200,000.

Syracuse, N. Y.—Palmer-Moore Co., from \$25,000 to \$100,000.

Aurora, Ill.—Bell Carburetter Co., to \$50,000, and changes name to Conklin Automatic Carburetter Co.

H. T. Haley is building a garage at Macon, Ga. It will be of brick and stone and will cost \$5,000.

Price Brothers have opened a garage on East Main street, Casey, Ill. They will handle the Ford car.

The Baker Garage & Machine Co. has been formed in White Plains, N. Y. Its place of business will be at 6 Central avenue.

The Pioneer Motor Co., of Muskogee, Okla., has found "pioneering" unprofitable and has filed a petition in voluntary bankruptcy.

A fireproof garage to cost \$60,000 is being erected at the corner of Washington street and Hall avenue, Roxbury, Mass. Samuel A. Brown is the owner.

Tire repairing will be featured by the Flatbush Vulcanizing Works, which just has opened a repair shop at 2182 Clarendon Road, Brooklyn, N. Y. M. Weston is the proprietor.

Incorporated under the laws of Michigan, the Creston Auto Co., of Grand Rapids, has opened a garage and repair shop. C. M. Smith is president, and C. McAuley the manager.

The Key City Auto & Supply Co. is the style of a new concern which has been formed in Dubuque, Iowa, with headquarters at 729 Locust street. D. H. McCarthy is the manager.

The Autocrat Tire Co., of 3840 Olive street, St. Louis, Mo., has leased the building at 3133 Locust street for a term of years. It will move into the new salesrooms on September 1st.

Harry W. Doherty, who was the Studebaker agent at Portland, Ore., has been appointed manager of the factory branch which the Studebaker Corporation has opened in Tacoma, Wash.

The Lake Shore Auto Station, of Chicago, Ill., has purchased the property at 1512-1518 North Clark street, and will erect thereon a garage. The building will be 102 x 158 feet and will cost \$50,000.

Joseph J. Mandery has secured a permit for the erection of a two-story garage and service building at the corner of East avenue and Matthews street, Rochester, N. Y. It will be 124 x 198 feet and will cost, when complete, \$42,000.

James Bayless, who represented the Mitchell Motor Car Co. in Birmingham, Ala., has resigned his position and the agency has been given to D. A. Carsons. Temporary headquarters have been established at the Hillman building.

Howard D. Fisher, formerly with the Hippodrome Garage at Leavenworth, Kan., has gone into business on his own account and opened a garage at 512 Walnut street, in the same city. He will operate under the style the Walnut Street Garage.

The St. Louis (Mo.) branch of the Times Square Automobile Co., which was established there two years ago, has been discontinued. Its president, D. Donnelly, has opened a new salesroom under the style the St. Louis Automobile Exchange.

R. F. Thompson, formerly San Francisco manager of the Michelin Tire Co., has switched over to automobiles and become manager of the Howard Automobile Co., at 162-166 Twelfth street, Oakland, Cal. The company deals in Oldsmobile and Buick cars.

W. H. Imes and Albert E. Jones have purchased a controlling interest in the Weir Motor Car Co., of Topeka, Kan., and will continue the business under the style the Jones-Imes Motor Car Co., at 914 Kansas avenue. Marmon, American and Chalmers, and Detroit electrics will be handled.

F. P. Oswald, formerly proprietor of the Oswald Motor Car & Supply Co., has formed the Economy Automobile Co. and opened a garage and machine shop at 49 Lagrave street, Grand Rapids, Mich. He will take the agencies for several pleasure cars and will also handle commercial vehicles.

E. F. Blue, manager of the Toledo-Mansfield Rubber Co., has added automobiles to his other interests and formed a partnership with W. H. Aldrich, for the distribution of Reo cars in the Toledo territory. His headquarters will be at 1115 Madison street, which is the store of the rubber concern.

The Russell Motor Co., of Duluth, Minn., has been placed in the hands of a receiver on application by three of its creditors, the Duplex Mfg. Co., of Superior; Johns-Manville Co., of Milwaukee, and the First National Bank of Biwabik, Minn. Fred S. Harlow has been appointed by Judge Morris to disentangle its affairs.

Edward Gellinger, manager of the Stoddard-Dayton Automobile Co., of Portland, Ore., has leased the three-story building at Twenty-first and Washington streets, now under construction, for the term of five years. The structure will be 100 x 100 feet and will house Stoddard-Dayton, Paige-Detroit, Federal and Kissel cars.

The Faribault Engine Mfg. Co., of the Minnesota town of that name, has added automobiles to its manufacturing opera-

tions. It has built a garage and salesroom adjoining its plant, and will handle E-M-F cars, with Dr. N. S. Erb as general manager. F. R. Kummer will have charge of the repair and garage department.

The Chicago Motor Transportation Co., which was incorporated two weeks ago, will begin, on October 1, to operate a number of motor buses between the two big railway stations and the State street department stores. They will be fitted with low side entrances, heated by steam and cooled by electric fans, and will seat eighteen people comfortably.

C. A. Radcliff, of the Radcliff Motor Car Co., Louisville, Ky., has acquired the business of the Southern Motor Sales Co., handling the Cole car, and has amalgamated the two concerns. His principal office will be at the former headquarters of the Southern company, at the corner of Third and Breckenridge streets. In addition to handling the Cole, he will continue to represent the Stevens-Duryea.

Under the style the Weaver-Sealand Motor Co., a new concern has "opened up" at 1216 Huron Road, Cleveland, Ohio, to handle the Pierce-Arrow and Everitt lines. A service department for Pierce-Arrow trucks also will be installed on September 1. O. L. Weaver, formerly Ohio distributor for the Willys-Overland Co., and Frank Sealand, of the Winton Motor Carriage Co.'s Cleveland branch, comprise the company.

The application for a receiver for the Automobile Livery & Sales Co., of New Orleans, La., has been denied by Judge Skinner, under the provision of the Louisiana law, which does not provide for receiverships unless the company is insolvent. Richard Brock, one of the partners in the concern, had applied for a receiver in order to compel Fred and Charles Stock, the other two partners, to render an accounting of their management and to give him his proper profits. He alleged an intention on the part of the brothers to ruin the company and to use the proceeds to set up in another business independently.

Recent Losses by Fire.

New York City, N. Y.—Storerooms of Standard Tire Co., 1777 Broadway, burned. Loss, \$500.

Jamestown, N. Y.—J. C. Ball's garage at McDonnell and Royal avenues, and two automobiles, badly damaged. Loss, \$2,500.

Peru, Ind.—Great Western Automobile Co.'s plant slightly damaged; one test car and quantity of material burned. Caused by dropping of match into oily waste.

ORIGINAL PLANT 1902

RIM AND TIRE PLANT

The demand
for Firestone Tires and Rims has
grown phenomenally, and

The facilities
for taking care of this unprecedented
growth have expanded proportion-
ately until today we are operating
the largest exclusive tire manufac-
tory in America—but

The policy
has not been changed. It is the
same today as it was when we start-
ed, a few years ago, in the dimin-
utive plant shown above—"the best
irrespective of cost—the most miles
per dollar."

Extensions of Equipment Liberality.

With the remarkable situation that it is the high priced cars and the low priced cars that are most liberal with equipment, while many of those that might be called in the middle range of price are quite meager in the amount of "extras" that are included in the selling price, the general tendency, frequently observed, is for more complete equipment that ever before. It would seem, however, that in many cases the manufacturer's zeal in providing equipment and accessories obtainable from the accessory makers is not matched by what he himself might do in adding minor and inexpensive features that would tend to impress the purchaser and owner.

Private experimenters, by calling in designing talent and spending considerable money, are from time to time showing that if a maker intends to equip his cars with acetylene tanks, it is possible to provide a suitable concealed place for them; that

tire holders and cases need not be excrescences outside the driver's seat, and that in addition to a proper original provision for receiving all the recognized accessories, the car may have various comforts and conveniences that if originally incorporated would add a cost that would be trifling in comparison with their benefits. Among these conveniences may be listed such things as rainproof tour book holders, pockets for waste and for such of the tools as are most frequently used, concealed but readily accessible tool boxes, matchbox holders, number-plate holders, inseting of side and rear lamps, improved piping arrangement for acetylene, and like refinements.

Undoubtedly in selecting equipment for owners it is hard to please everybody. If "clear vision" wind shields are provided, some owners may regard them as dangerous and prefer the brass channeled glass as not being so likely to cut their necks in a collision. Others will grumble if the brass channels divide their view of the bonnet, and would prefer "clear vision." Still others believe themselves much more capable of selecting accessories for their individual needs than the car maker could be. Nevertheless, few if any makers have received complaints from their customers on the ground of over-liberality in the matter of what is provided, as customers generally are glad to accept all that is given.

Whatever is done by the car maker in providing for the comfort and convenience of his customers is bound to meet with appreciation and response from an overwhelming proportion of his customers, and is certain to have a corresponding effect in attracting new friends. If a manufacturer reaches the limit in providing all the accessories that are available in the market, he can find further extensions for his forethought and liberality by modifying his car to receive them in such a way that they become parts of a complete whole instead of their being afterthoughts plastered on like cockleburrs on the tail of a fox terrier, and by creating minor conveniences of his own origination.

A New Nationalism for the Highways.

Several bills in favor of the construction of National highways have been introduced recently—by request—in the United States Senate, as well as in the lower House, and it would seem that out of the quantity of material presented a good and serviceable

foundation for a system of truly National highways might be established. It would be well enough if the bills at present before Congress had been introduced in good faith by the senators and congressmen, whose names are attached to them. Unfortunately they belong to the general order of legislative "strikes." They may have been drawn up at the suggestion of some local celebrity who by this means endeavored to place his town or city "on the map" by the expedient of building the map to order, or, in the language of the rostrum, upon the route of the "ultimate national highway—that is to say, the highway which sooner or later must be established across the continent, if the United States are to maintain their position in the vanguard of the nations." Or else they may be intended to create a number of commissions, and incidentally "fat" jobs for a select few, with the idea of a national highway appearing in the remote distance, as a mere "necessary evil." Appropriations of \$1,000,000 and more are "authorized" in these bills, and an enormous amount of bombastic talk is indulged in, but nothing is accomplished. If, instead of endeavoring to create commissions, and engineering boards, and "committees of responsible citizens," Congress would use its present Committee on Post Roads and quietly start building even the smallest section of the hoped-for trans-continental road, it would be taking a mighty step in the right direction. "L'appetit vient en mangeant"—and once the advantages of a stretch of genuine "National" road are realized, there can be no question of the spread of the movement that would make of the highway a truly National institution.

Excesses in Truck Operation.

Commercial vehicle builders are wont to complain of the bad habits of their customers. Despite every precaution on the part of salesmen, demonstrators and instructors, they explain with furrowed brows that the users will persist either in overloading or overspeeding their trucks, or both. Whether the offense is committed with or without the direct knowledge of the owner of the vehicle is not always easy to discover. However that may be, the fact remains that such abuses are prone to cause early decay in the vehicles and, by shortening their useful lives and increasing their cost of upkeep, to reduce the owners' confidence in motor haulage.

In the same connection it may not have occurred to some of the more ambitious truck builders that they themselves inadvertently may be contributing to just such unsatisfactory operating results. The load-carrying question has been pretty thoroughly discussed, and from every possible angle. One impression that remains after all's said and done, however, is that when a "three-ton" truck is sold with the whispered assurance that it is "strong enough to carry five," the new operator is practically certain to put it to the test. Just in the same way, a maker who counsels low running speeds under load and then provides a transmission gearing such that the machine can be driven at upwards of fifteen miles an hour, is almost sure to have to contend with troubles resulting from over-speeding. One manufacturer, having provided a governor to limit the speed of his product to a safe maximum, indicates to his customers that it is possible to exceed that limit in but one way, namely, while coasting; letting the truck run free down hill; therefore, he insists is a practice which must be avoided.

Still another way in which not a few makers may be working against their own best interests is in the marketing of vehicles which are too heavy to be employed economically in certain localities. Vehicles that are so ponderous as to work immediate havoc with the roads over which they run, must in the very nature of things suffer corresponding strains. Ordinarily it is argued that bad highway conditions are sadly interfering with the development of motor traction. Which is unquestionably true. But would it not be wise to make the best of a bad matter by adapting the design of the equipment to suit existing conditions, especially seeing that highway improvement is a question of slow and painstaking development?

It frequently happens that in localities where one maker's product fails to win approval, that of another is highly regarded. The very question of proportioning the vehicle to meet highway conditions is at the root of the enigma. In country districts the lighter vehicles work to best advantage. In cities the maximum serviceable weight remains to be determined. This much is certain, however, that there is a growing tendency to exceed it. Trucks that tear up and destroy the pavement must, of necessity, themselves suffer. The movement for moderate loading and care-

ful adjustment of speeds is now well under way, but it still remains to effect a compromise between the advantages of concentrating loads in large units and the disadvantages that result from excessive wheel pressures.

"A workman is known by his chips" and a motorist by the way he changes gears. Likewise the skilled driver is distinguished by the way he uses his brakes, as has been said before. But one of the ways in which prudent driving immediately is revealed is

not so much in the application of the brakes as in the way in which they are released. With decreasing speed a diminishing amount of force is required to maintain uniform retardation, therefore the brakes may be gradually released as the car loses headway until it comes to rest without shock. The careless driver invariably "brings up with a round turn," even as he starts with a crash, and thereby subjects his car and its occupants to something of a jolt. Besides being more graceful, the other method saves wear on the bands.

BURMAN AND THE BENZ IN CANADA

Moross's "Headliners" Perform at Montreal and Crowd Has Chance to Shudder—Unusual Handicapping.

E. A. Moross's racing aggregation appeared at Montreal on Sunday, 20th inst., and performed with its usual brilliance, brilliance quite sufficient to dim the two or three local lights that participated in the automobile races which were contested at Delorimier Park. The track is a half-mile dirt course and the races had been scheduled for Saturday, 19th inst., but rain on that date, which put it in bad condition, postponed the event until the following day.

Robert Burman with his Blitzen Benz was widely credited with a mile "record" on a half mile track, both for the track and for himself. The particular mile referred to, however, was an indeterminate distance, made in competition, and was not officially timed. In other words, it was no record at all, even for the track. Even had it been legitimate time, the American Automobile Association does not recognize "records" which are made on tracks smaller than one mile in circumference. The week previous Burman, at Electric Park, Baltimore, Md., on a half mile track in a time trial rolled off a mile in 1:08 minutes.

The race in which he is credited with lowering both the time of the Delorimier and Electric Park tracks was the feature of the day. It was a three miles open handicap between Burman (Benz), Kilpatrick (Hotchkiss) and Knipper (Mercedes), which was won by Burman in 3:52½, after he had given Kilpatrick 15 seconds start and Knipper 10 seconds. During the second mile he is credited with twice encircling the course in 1:07 minutes. In another three mile handicap in which two local men—Gadbois and Cavers—competed with the "speed-king" in E-M-F and Hudson cars respectively, Burman's time was 3:18. Unusual handicapping methods were revealed in this race, Cavers being allowed one mile and 30 seconds—not one minute and 30 seconds—and Gadbois starting with a lead of one mile. Burman won easily though he had to go about one-third further than the others.

In the race for small cars Gadbois in an E-M-F was accompanied by Percy Gibbs of the E-M-F factory at Detroit, and led from the start. Cavers (Hudson) and Grennan (Ford), were 60 yards behind on the fourth lap and on the seventeenth lap Grennan retired. Cavers was second. The time was 8:15½. Gadbois also won a five-mile race from Cavers in which but these two participated. The time was 6:37½.

The two mile match race between Knipper and Kilpatrick was closely contested, and up to the moment that Knipper crossed

the tape a half a length in front of Kilpatrick, it was in doubt. First one then the other led from the start until just near the finish, when Knipper drew a little in advance. The drivers were so close that some of the spectators thought Kilpatrick had won. The time was 2:32. The summary:

Five miles, stock chassis, 161 to 300 cubic inches—Won by A. Gadbois, E-M-F; second, Cavers, Hudson; Grennan, Ford, retired after 17th lap. Time, 8:15.

Two miles time trial—William Knipper, Mercedes, 2:26 minutes. Track record, 2:20 minutes.

Two mile match, between Bob Burman, Benz, and William Knipper, Mercedes—Won by Burman. Time, 2:40½.

Three miles handicap, free-for-all—Won by Burman, Benz, (scratch); second, Cavers, Hudson, (one mile, 30 sec.); third, Gadbois, E-M-F, (one mile). Time, 3:18.

Two miles match, between William Knipper, Mercedes, and H. J. Kilpatrick, Hotchkiss—Won by Knipper. Time, 2:32.

Five miles match, between A. Gadbois, E-M-F, and Cavers, Hudson—Won by Gadbois. Time, 6:37½.

Three miles handicap, free-for-all—Won by Burman, Benz, (scratch); second, Kilpatrick, Hotchkiss, (0:15); third, Knipper, Mercedes, (0:10). Time, 3:52½.

Wisconsin Association Places Awards.

All protests following the announcement of the winners of the Wisconsin State Automobile Association's reliability run, which was started on July 17 and finished on July 22, having been amicably settled, the prizes have been awarded by the judges as follows: The two principal prizes, the Milwaukee Sentinel trophy, for the sweepstakes, and the Milwaukee Journal trophy, for the best score in the touring car class, both went to Harry Bisbee, driver of No. 8 Imperial. Diener, who piloted a Ford, was awarded the Milwaukee Evening Wisconsin trophy as winner of the runabout class, and the Emil Schandain trophy went to J. D. Babcock, whose Franklin had the cleanest slate in the private owners' division.

The complete score, irrespective of classes, was as follows:

Car and Driver.	Total Penalties.
Imperial, Harry Bisbee.....	1
Ford, W. H. Deiner.....	2
Cadillac, A. A. Jonas.....	3
Krit, W. G. Westwood.....	4
Reo, A. J. March.....	6
Imperial, H. Crampton.....	8
Warren-Detroit, R. D. Rockstead..	14
Overland, R. G. Bates.....	22
Case, Will Jones.....	29
Buick, E. Hokanson.....	31
National, Chas. Merz.....	33
Franklin, J. D. Babcock.....	61
Buick, Geo. P. Hewitt.....	63
Buick, D. Nicolazzi.....	162
Regal, C. H. Delafield.....	259
Petrel, J. J. Mack.....	Withdrawn

Schandain Trophy.

Franklin, J. D. Babcock.....	17
Auburn, C. Hucksdorf.....	1487
Kissel, M. L. Stevens.....	1646

THREE PERFECT IN ST. LOUIS RUN

Reliability Tour to Kansas City and Back Proves a Strenuous Undertaking—Luncheons Galore.

Thirteen entrants participated in the first three-day inter-city reliability run from St. Louis to Kansas City and return, which was inaugurated by the St. Louis Automobile Dealers and Manufacturers' Association on Monday, 14th inst. Of that number but three survived the trip with perfect scores. They were, T. E. Baker (Dorris); H. L. Bagley (Ford); and W. B. Scott (Flanders). The contestants left St. Louis at one minute intervals in the following order: C. C. Donovan, Inter-State; J. E. Davis, Dorris; C. M. Brainard, Mitchell; Herman Schnure, Marmon; H. L. Bagley, Ford; Frank Dunnell, Ford; George Bolz, Ohio; E. P. Rhodes, Buick; George Neff, Cadillac; Dan Histon, New Parry; G. M. Herron, Flanders; B. W. Scott, Flanders; John H. Phillips, Hudson; C. S. Gilpin, Ford, non-contestant.

The noon control was at Louisiana, Mo., and all the contestants made the journey of 98 miles in a little under five hours, without incident, as the roads were in almost perfect condition. Dan Histon (Cadillac) and C. M. Bernard (Mitchell) arrived first. The citizens of Louisiana received the motorists with enthusiasm, and a local innkeeper provided complimentary entertainment in the form of luncheon and garage service. Leaving Louisiana the party proceeded to Moberly, via Mexico, the first day's destination and 198 miles from St. Louis. Three cars were penalized for road errors. Frank Dunnell (Ford) lost 7 points for running out of gasoline; E. P. Rhodes (Buick) and G. M. Herron (Flanders) lost 6 and 10 points respectively for being late at control.

The return from Kansas City was made over the northern route and the destination of the third day's trip was at Columbia. The run was over the hardest roads of the tour. Not only were clean scores of four additional contestants marred but the pilot car, an American Traveler, driven by W. M. Johnson, went out of commission and for the balance of the journey W. M. L. Stevens, of Kansas City, the official referee, accompanied L. S. Maurer, the pacemaker, in an Amplex. The Ohio, driven by George Boltz, which during the first two days had a perfect road score, was withdrawn because of an accident to its ignition system. The highest scores against the cars were 49 against the Flanders driven by Herron and 56 against the Inter-State, driven by Donovan. During this part of the trip, J. H. Phillips (Hudson) was assessed 15 points for minor troubles. The run into St. Louis was without incident and no additional penalties were imposed.

FINAL TOUCHES ON ELGIN COURSE

Everything is Ready for Raising the Curtain on National Road Races—Some Speedy Practice Work.

With the first of the 1911 stock chassis road races, and according to present indications the only strictly stock car road events which will be held this season, just one day off, all of the drivers now are on the stage at Elgin, Ill., where the curtain will be raised tomorrow (Friday) on three events in one. They are the Illinois trophy

practice is going on. For two hours each day, from 11 in the morning till 1 in the afternoon, the $8\frac{1}{2}$ miles circuit is closed to the public, and some unusually fast laps have been reeled off. In fact, some of the lighter cars have shown bursts of speed in excess of the best time made last year in the big car race, and the chances that Mulford's average of 62.5 miles an hour, made last year, will be eclipsed, look better than ever.

That Mulford is out for blood and is prepared to push his mount to the limit to defend his title to the big trophy is evidenced by the way he is driving in practice. On Tuesday, 22nd inst., he laid claim

Lee, both are credited with fast laps. The "Simplex twins," De Palma and Wishart, are factors in the betting, too, though comparatively little has been seen of them in practice. De Palma was not out on Tuesday, having met with a slight accident on the previous day, and Wishart contented himself with jogging around for a single lap.

Despite the fact that practice is carried on under almost the same conditions as the races will be run, flagmen being stationed at frequent intervals around the course to warn drivers and spectators, several accidents have been recorded, one of them proving fatal to Ralph Ireland, who was

ONE OF THE IMPROVEMENTS IN THE ELGIN COURSE—A LEVELED HILL ON THE HOMESTRETCH

race at 200 miles for cars in the 301-450 inch class, the Kane County trophy race at 170 miles for cars in the 231-300 inch class, and the Aurora cup race in which the "baby" cars—161-230 cubic inches piston displacement—will race 135 miles. On Saturday, the Elgin national trophy race, which is the piece de resistance, will be staged; it is 305 miles and is for cars having not more than 600 cubic inches piston displacement.

It is over a course well prepared that

to the fastest lap yet made in practice and incidentally the fastest lap that ever has been made over the course; unofficially he was clocked in 7:10, which is at the rate of close to 72 miles an hour. Aitkin in his big blue National also looms large, his practice spins being just a shade slower than Mulford's. Grant, with the "Old 18" Alco, is working out at his usual conservative pace of about 65 miles an hour—the pace that won him two Vanderbilt races—while his team mates, Hartman and

driving a Staver-Chicago in practice for the Kane County event. A blown out tire is said to have caused the accident, and though Ireland subsequently died, his mechanic escaped with minor bruises and cuts.

The course itself is in almost perfect condition. As was told last week in the Motor World, practically all of the roads have been widened and "ironed out," and in one place a hill has been leveled. The "stretch" in front of the grandstand is, to quote one

THE SMOOTH, 54-FOOT-WIDE MILE OF ROADWAY IN FRONT OF THE GRANDSTAND

of the drivers, "as smooth as a billiard table." A mile of this stretch is 54 feet wide and the remainder varies in width from 25 to 30 feet. But a single complaint as to the condition of the course was heard, and that was caused by over-zealousness on the part of the workmen in sprinkling too much oil on the third leg, MacLean avenue. The major portion of it was removed, however, and now that part of the course is in as perfect condition as the rest of it. Unless heavy rains occur before the race the course will be unsurpassed as to speed and safety.

The prize "pot" has been still further

time. The list as it stands at present is as follows, and it is unlikely that there will be any changes, though it is hinted that the entry of a second Abbott-Detroit for the Aurora cup has been made:

Elgin National, stock chassis under 600 inches.

Car.	Driver.
Alco	Grant
Alco	Hartman
Alco	Lee
Cino	Burt
Lozier	Mulford
Mercer	Hughes
National	Zengle
National	Aitken
Pope-Hartford	Buck

Aurora Cup, stock chassis, 161-230 inches.

Abbott-Detroit	Roberts
Ford	Kulick

French View of Prince Henry Tour.

Speaking editorially of the recent Prince Henry Tour, and of its probable effects upon other large automobile organizations, the French automobile paper "Omnia-La Locomotion" commends the extreme diplomacy and delicacy with which the whole event was handled from the beginning. "The symmetrical distribution of the various cups and prizes does not tell us any-

UDINA TURN WHICH HAS BEEN WIDENED TO 80 FEET

ANOTHER EXAMPLE OF TURN WIDENING AT McQUEEN'S

APPROACHING McQUEEN'S TURN ON ELGIN COURSE

"sweetened" by the offer of C. F. Splitdorf of \$1,475 to be split up among the winning drivers in the four events, contingent upon the use of Splitdorf ignition apparatus. Two hundred and fifty dollars will be given the winner of the Elgin trophy, with \$150 and \$100 for second and third places respectively. In the contests for the other three trophies, the Splitdorf bonus will be \$150 for first, \$100 for second and \$75 for third in each case.

With the nomination, by the National Motor Vehicle Co., of Aitken and Zengle for the Elgin trophy and Merz and Herr for the Illinois trophy, the list of drivers now is complete. Earlier in the week, Nikrent and Robillard were assigned to the two Staver-Chicago entries in the Kane County event, which up to then were without accredited pilots, and the unnamed Colby and Cole drivers were given as Oren and Morris, respectively, about the same

Simplex	De Palma

thing about the individual performances of the cars or drivers; it does not give any one participant the chance or right to gloat over the poor showing of some other contestant. This highly commendable decision was made in order to preserve the absolutely 'private' character of the tour: Prince Henry had asked nothing of any manufacturer or of the general public, and therefore was bound by no obligations to either of them; the exact results of such a tour can only be of value to the manufacturer for advertising purposes, or to the bolstering up of the pride of the 'clean score' contestant. The German prince desired an enjoyable, elegant sporting trip unmarred by internal friction due to jealousy, and he succeeded beyond his expectations. In fact, he succeeded in establishing a new 'formula' for holding endurance runs for amateurs—that of 'good-fellowship.'"

NO STOCK CAR WEIGHT MINIMUM

**Manufacturers Contest Association Meeting
Has Resulted in Removing It—Fewer
Stock Car Races.**

Though a part of the transactions of the annual August meeting of the Active and General Rules Committee of the Manufacturers' Contest Association, which was held in Detroit on the 10th and 11th inst., at last has been made public, little, if anything, more than was published last week in the Motor World has been divulged, the report being principally a confirmation of the information which had leaked out previously. Russell A. Field, secretary of the M. C. A., refused to be interviewed on the subject of the meeting, though he admitted that a large amount of business not mentioned in the report had been transacted but would not be made public.

The only real action which was taken at the meeting was the elimination of the minimum weight restrictions from the rules governing stock car events. Hereafter a car need not be of a prescribed minimum weight to be eligible for stock car events. This rule already has gone into effect. With this single exception, the rules remain unchanged, all of the other business transacted being in the nature of discussions, the fruits of which were a number of recommendations which may or may not be accepted.

One of the important matters under consideration, as stated last week, was that pertaining to racing on half mile and mile dirt tracks. As a result of the discussion it was recommended to the Contest Board of the American Automobile Association that no sanctions be issued hereafter for half mile tracks, and that promoters desiring to hold meets on mile tracks be required to furnish a cash bond to insure that the track be properly safeguarded, such safeguarding to include the sprinkling of the track with oil or some other substance to lay the dust, and the removal of the fence to a safe distance from the track.

One of the recommendations which just has come to light was to the effect that the number of stock car events next year be reduced to the point where the Contest Board will be in a position to see that the stock car restrictions are strictly lived up to. Such events would include road, track and beach racing and hill climbs, and would be allotted with due regard to the normal automobile centers of distribution in the country.

George Robertson, president of the newly formed Racing Drivers' Association—the "drivers' union"—was among those who attended the meeting, and made several recommendations which are being duly considered. The principal of these was that racing drivers be divided into two classes,

novices and professionals, and that a driver be required to win his novice race before being allowed to compete with professionals. Robertson also made a number of other recommendations expressing the sentiments of the drivers concerning the protection of their rights.

Other suggestions and recommendations which were made are substantially as already stated, the subject which caused the greatest amount of discussion being that pertaining to commercial vehicle contests. Before it was formally recommended that sanctions for such contests be refused except to duly organized clubs, it was suggested that different schedules be adopted for contests in cities and those which are held in the country. No action was taken on this question.

Organizing by Counties in Nebraska.

The Nucholls County Automobile Club is the title selected by motorists of Nucholls County, Neb., for a new club formed in Nelson. The officers are: President, J. W. Lamb, of Nelson; first vice-president, J. H. Fair, of Hardy; second vice-president, J. M. Silvers, of Superior; secretary-treasurer, J. W. Whereman, of Nelson.

Forty-five motorists of Clay Center, Neb., have formed the Clay County Automobile Club, which will affiliate with the Nebraska State Automobile Association. The officers are: President, C. H. Epperson, of Fairfield; vice-president, Dr. J. C. Lattax, of Clay Center; secretary, L. B. Stiner, of Clay Center; treasurer, Gus Bender, of Stutton.

Motorists of Geneva, Neb., have taken preliminary steps to form the Filmore County Automobile Association to affiliate with the state organization. D. E. Watson, secretary of the Nebraska State Automobile Association, will act as president until each precinct of the county is heard from, and permanent officers are elected.

Amarillo to Give Ambitious Meet.

Down in Texas, where big things are done in small towns, there is to be a race meet which the promoters say will eclipse the Galveston affair. It is to be held on a track near Glenwood park. The park is in the suburbs of Amarillo, the principal town of Porter county, in the Northwestern section of the Lone Star State, and the date set is September 2 to 4. Amarillo has a population of 9,957 according to the last census, and it appears that every resident either owns an automobile or is nearly related to some one who does. The race meet is promoted by the Panhandle Auto Fair Association.

Jersey's Commissioner Will Resign.

New Year's Day, 1912, will be a joy day for many motorists in the East. On that day J. B. R. Smith, state commissioner of motor vehicles for the State of New Jersey, will retire from office to practice law, according to an official announcement.

TWENTY-TWO GLIDDEN ENTRIES

**Private Owners Attracted by Changes in
Big New York-to-Jacksonville Tour—
Savannah's Invitation.**

Since the definite settlement of the date and route of the 1911 Glidden tour, which, as stated last week in the Motor World, will be started from New York City on October 14th, and will be terminated 10 days later in Jacksonville, Fla., entries have been very much more in evidence. Twenty-two entries have been received by the American Automobile Association, and, demonstrating the fact that the changing of the tour to a Grade IV contest has stimulated the interest of private owners, considerably more than half the entry blanks bear the signatures of persons who are not connected with the trade.

That manufacturers, too, are now prepared to lend their support to the tour is evidenced by the fact that several of them have come forward with entries, two of them, the Studebaker Corporation and the U. S. Motor Co., having nominated teams of three each. Three 1912 Maxwell constitute the latter's entry and the team will be designated "N. Y. Team No. 1." The Studebaker has entered three E-M-F cars. The remainder of the entry list is as follows: Mayor Courtland S. Winn, of Atlanta, 1912 Flanders; Major John S. Cohen, 1912 White (gasolene); J. H. Marsteller, Chalmers; Dr. W. M. Stimson, Oldsmobile; Claude N. Nolan, Cadillac; Robert P. Hooper, Garford; Edwin P. Ansley, Pierce-Arrow; C. H. Johnson, Stevens-Duryea; H. M. Grant, Marmon; Herbert B. Race, Cole "30"; S. S. Albritton, Cadillac; Capt. W. J. Hillman, Cadillac; Alan H. Whiting, Cunningham; Ray M. Owen, two 1912 Reos.

Despite the fact that the Savannah Automobile Club has been making strenuous efforts to have the route of the tour changed so as to include Savannah in the itinerary, and even has gone so far as to notify the A. A. A. that it would send a representative to confer with officials of the sports governing body, it is extremely unlikely that any change will be made, inasmuch as the A. A. A. has entered into a definite agreement—a "contract," to quote an official of that body—with other interests wherein all arrangements have been settled. Failing to obtain a change of route, it is said that the Savannah Automobile Club will endeavor to have the date of the tour changed so that the tourists will be in the vicinity of Savannah at the time of the Grand Prize and Vanderbilt races.

It is expected that the pathfinding car, carrying a representative of the Touring Information Bureau of the A. A. A., will leave New York not later than next week.

SAND AND MUD HAMPER TRUCKS

Last Three Days of Chicago-Detroit Contest Result in Heavy Penalties—Final Score Based on Costs.

It was over entirely different and very much worse roads that the 25 surviving trucks in the Chicago American's nine days reliability contest were forced to run on the last three days. They were hub deep in sand and mud alternately, and the severe conditions tested the trucks to the utmost, with the result that but seven of them could show clean scores when the run was finished at Chicago on Thursday last, 17th inst. The winners, which were determined on the cost per ton mile basis, and not on road and technical scores alone, were as follows: Division 2K, 24-Lincoln; division 3K, 10-Buick; division 4K, 23-LeMoon; division 5K, 32-Federal; division 6K, 2-Gramm; division 7K, 13-Mais; division 8K, 17-Kelly; division 9K, 4-Gramm. Following is the list of penalizations for the last three days, the complete recapitulation being given in the accompanying table, in which an asterisk beside the name of the tires indicates that they are pneumatics.

Seventh day—Jackson to Kalamazoo, Mich., 65.9 miles—37-VanDyke, 13 points, motor stops; 20-Lauth Juergens, 1 point, fixing ignition wire; 30-Owosso, 50 points, replacing bolts in universal joint; 36-Stephenson, 57 points, adjusting clutch, replacing key on left jack shaft, putting chain on sprocket; 2-Gramm, 3 points, adjusting fan belt and bracket; 3-Gramm, 666 points, replacing fan belt, repairing radiator; 14-Dayton, 10 points, putting in new gasoline line; 4-Gramm, 49 points, replacing bolt on universal joint and cotter pin in gear shifting rod and adjusting clutch; 31-Little Giant, 5 points, changing spark plug and putting chain back on sprocket; 33-Chase, 2 points, changing spark plug.

Eighth day—Kalamazoo, Mich., to South Bend, Ind., 68.7 miles—37-VanDyke, 118 points, fastening underpan and stopping motor to let it cool; 20-Lauth Juergens, 62 points, repairing magneto contact breaker; 30-Owosso, 24 points, putting Woodruff key in gear shift lever, putting bolts in universal joint and replacing one ball; 3-Gramm, 563 points, replacing fan shaft and repairing radiator; 4-Gramm, 11 points, putting on new fan belt and tightening it later; 27-Krickworth, 1 point, putting on chain; 31-Little Giant, 5 points, putting chain back on sprocket; 33-Chase, 4 points, changing spark plugs.

Ninth day—South Bend, Ind., to Chicago, 96.7 miles—36-Stephenson, 1,988 points, broken crank shaft; 3-Gramm, 122 points, work on fan; 27-Krickworth, 3 points, putting chain back on sprocket; 31-Little Giant, 10 points, putting chain back on sprocket.

JERSEY RECIPROCITY IS GAINING

Movement Gets Endorsement and Promise of Aid from Governor Wilson—Higher Fees to Compensate.

Reciprocity at any cost appears at present to be the sentiment of New Jersey motorists. If laws conforming to the resolutions which were adopted at a public meeting at Asbury Park on Saturday last, 19th inst., are enacted, motorists of New York and other states soon will be admitted "free of charge" to New Jersey, though at an added cost to the Jersey motorists themselves, provision being made in the resolutions that license fees be increased in order to offset the fear that the revenue to the state might be decreased if reciprocity were granted. The resolutions, which were offered by Joseph H. Wood, president of the Associated Automobile Clubs of New Jersey, are as follows:

"Resolved, that a law be enacted with regard to the use of automobiles within the state which will grant the same rights and privileges to the owners and drivers of machines from other state, that are accorded the citizens of New Jersey in the state from which said owners and drivers hold their licenses, and be it further

"Resolved, that it is the sense of this meeting that the system of licensing automobiles in New Jersey be adjusted so as to show an increase in revenue."

Though the meeting was not as well attended as had been expected, the resolutions were not passed without a rather heated discussion and the withdrawal of others, also offered by Wood, calling for reciprocity but without any mention of an increase in the license fee. The meeting was presided over by T. Frank Appleby, mayor of Asbury Park, and president of the Ocean Boulevard commission, the latter body being responsible for the gathering. Though an invitation to be present had been sent to Motor Vehicle Commissioner J. B. R. Smith, he failed to appear.

The reciprocity movement now has the backing of Governor Wilson, of New Jersey, and motorists of that state are enthusiastic over the possibility of the removal of the "Chinese Wall" in the near future. Headed by A. G. Batchelder, chairman of the Executive Committee of the American Automobile Association, a delegation of owners visited Governor Wilson on Tuesday, 22nd inst., and he assured them that he will do all in his power to bring about a return of reciprocal relations between New Jersey and its neighbors.

Concrete Sign Posts for Nebraska Roads.

Because of the short life and the liability to breakage attending wooden sign posts erected on the highways, the Omaha Motor Club has designed and is using a new style

of posts, made from reinforced concrete, which appear to be giving excellent service. As the illustration shows, the posts are of gray concrete carrying a black sign of galvanized iron, with white letters and a hand pointing the way. They are eight feet high, weighing approximately 100 pounds, and are sunk two feet in the ground.

The road from Omaha to Tekamah, Neb., has been chosen for a trial installation of the signs, 31 of which were required properly to mark the 45 miles between the two towns. In order to protect them from vandals, and from the ubiquitous youngster

INDESTRUCTIBLE CONCRETE SIGN POST

who delights in using posts like this as targets for his rifle, the club has offered a standing reward of \$25 for the arrest and conviction of any one found to be tampering with or mutilating them. It is the intention of the club committee, composed of C. L. Gould, L. E. Doty, Lee Huff and W. J. Kirkland, to extend the posts to Nebraska City, a distance of 100 miles, and it is probable that other Nebraska clubs will aid in the matter and cover all important roads in the state with similar signs.

Maryland's View of Federal Aid.

Governor Crothers, of Maryland, who for some time has been in the foreground of the fight for better roads and for the national maintenance of these inter- and intra-state arteries of traffic, has caused to be published an open letter on the question of national good roads, in which he says in part:

"France has appropriated \$612,000,000 in Government aid to public highways, Amer-

ica \$14,000,000 many years ago, and this amount was only partially used and the roads and bridges made have long since fallen into decay. Millions of acres of the most fertile lands on this earth have been donated to the construction of our trans-continental railroads, and vast sums of money given to them as subsidies. Ships have been floated on Government money, and the rivers have long been pensioners of the United States Government.

"It is the vast population of our great commercial centers and overcrowded cities that demand good roads to enable the producers of this great land to supply cheaper daily the markets of the nation. Railroads are to-day crying for navigable roads as feeders to their lines of transportation and thus prevent shortage of cars and secure a steady flow of trade, consisting of farm products largely.

"Government aid in public highways improvement to-day overshadows any and all other measures before Congress. The city man and the citizens of the country should and will demand it."

Nutmeg Sunday Motoring is Safe.

Revengeful efforts to have all garages closed and all automobiling stopped in Connecticut on Sundays, by invoking the still existing blue laws forbidding secular labor, business, sport or recreation on the Sabbath, are not likely to meet with much success, according to Connecticut lawyers, as it has been found that the present governor, Simeon E. Baldwin, when he was an associate justice of the supreme court of the state, in 1895, handed down an opinion showing that an act of 1882 "was obviously intended to make traveling on Sunday no longer punishable as an offense against the law, and that of 1883 was passed to relieve from any penalty the owner or driver of vehicles used for such travel." Threats have been made by George H. Woods, of Bridgeport, chairman of the sports committee of the Gaelic League, that his organization will stop all motoring and the keeping open of garages on Sunday unless the state legislature passes laws for a more liberal Sunday. The Baldwin opinion, however, which was concurred in by the chief justice and three other associate justices, is regarded as fully covering the situation and protecting motorists and garage proprietors against successful attack on the Sunday question.

Big Bridge Will Save Tourists' Time.

By the opening of the new million-dollar bridge over the Connecticut river, between Saybrook and Lyme, which occurs today (Thursday), from half to three-quarters of an hour will be saved on the running time of automobiles en route between New York and New London, and points along the Sound. Hitherto a tedious wait for the ferry has been necessary at that point, despite which circumstance upwards of 14,000 cars were carried over last summer.

Unit Systems in Rear Axle Construction

Illustrative of the development of the automobile, which steadily is advancing toward that point where for simplicity and accessibility each part, or group of parts, will embrace a unit which may be removed for repair or replacement without the necessity of disturbing other units, the location of the change gear mechanism and the differential of shaft driven cars in the same housing, thus making of them a unit, is a step which, while slowly gaining in popularity, particularly in light car construction, nevertheless has been, and still is, the subject of numerous controversies. It is a

pendent of spring action, as differing from the location of the unit in chain driven cars where its weight is carried above the springs, new problems became apparent. In present day practice, the numbers of makes of car in which the change gear mechanism is combined as a unit with the engine and in which it is combined with the differential are very nearly equal, while the number of makes in which the gear box is a separate unit outnumbers them both almost three to one.

Despite this fact, which might perhaps be construed to serve as a clinching argu-

Which is to say, that as traction is better, the tires being more constantly in contact with the ground and not subject to the possibility of slight slippage if in going over an especially abrupt bump the wheels should leave the road and spin, the momentum thus gained and the increased power of the engine when permitted to "turn up" faster combining toward this end, tire depreciation really is less.

But there is another side to the weight question, viz., the possible effect of the momentum generated in the rear axle when the car is driven rapidly over rough roads. In theory and also in practice, this momentum is tremendous, but whereas dire results at first were predicted, and it was suggested that the whole rear system would "shake itself to pieces" or at least the fairly delicate mechanism would be deranged seriously by the constant vibration which, it was stated, also would have a deleterious effect on other parts of the car, in practice no such troubles have evinced themselves. As a matter of fact, rear axle located transmissions on the whole have given no more trouble than those of any other type, none of which is especially noted for its trouble producing proclivities.

Placing the gears in a unit with the differential, on the other hand, makes for a more equal distribution of weight, and this in turn reduces the tendency to side slip. Further than this, the removal of part of the weight from the front axle and wheels permits of more even tire wear and naturally allows of an easier steering vehicle.

From the point of the reduction of weight of component moving parts of the transmission system, the rear axle located change gear set has several advantages. In the first place, owing to the fact that the torsional strain transmitted by the drive shaft and the universals is multiplied in the gearing, both the shaft and the universals may be made lighter. Since the gearing is directly at the rear axle, the propeller shaft rotates at greater speed to transmit the same power as would be transmitted at slower speed if the engine drove the gearing direct and the propeller shaft were driven from that. In other words, it is subjected to smaller torque.

While the benefits to be derived from the actual reduction in weight alone almost are nil, other features, directly attributable to the reduction, are extremely desirable. The least of these is that the lighter shaft, being more resilient, will act more in the way of a spring drive than the heavier one, thus absorbing many of the minor shocks and jars which otherwise would be transmitted back to the engine; probably the greatest is

FIG. 1—GLIDE REAR AXLE CHANGE GEAR UNIT

development in sharp contrast to that of the unit power plant—each system having advantages peculiar to itself.

The combination of the change gear mechanism, or the transmission, as this part of the car is more generally though none the less erroneously known, and the differential in a single housing is not a new element in the arrangement, however. From the earliest days, manufacturers of chain-driven cars have made use of the system as obviously the best, owing to the fact that the positive maintenance of the relative positions of the shafts in the change gear set and the differential thereby is assured, and also because of the decreased cost of manufacture which is possible with the use of one housing instead of two.

But with the application of the system to shaft driven cars, the location of the unit of necessity being at the rear axle inde-

pendent against the combining of the change gear mechanism and either the engine or the differential, not a few manufacturers have come out in favor of the former, as evidenced by their late productions, and there appears a well-defined tendency in favor of the latter arrangement as well.

Probably the greatest argument which can be advanced against the system is that necessarily there is a certain amount of increased weight which is carried "unsprung"; this weight being distributed between the gears, the case and the slightly heavier rear axle which is necessary by reason of the increased load which it has to carry. But while it is claimed by advocates of other systems that the extra unsprung weight, dependent on the tires alone for the absorption of road vibrations, assists materially in tire depreciation, it is claimed by advocates of this system that the extra weight actually has the reverse effect.

that owing to the reduction in inertia of the lighter universal joints, the life of the gears which are harmed when brought together with heavy bodies rotating on the shafts, is lengthened.

again good designing coupled with good material and workmanship conquered. Trouble from this source seldom, if ever, is heard of.

The principal advantage of the system is

sion gearing in one housing, and therefore the ease of inspection of the whole, the compactness of the unit, and last but not least the comparatively low manufacturing cost, and the reason for its increasing popularity becomes apparent.

Still another point in its favor is that it tends to reduce the "drumming" of the gears, which, in certain types of separate gearset is particularly assertive and annoying. Resulting, as it does, from the reinforcement of the humming sound made by the gears by the natural resonance of the gear box, the noise is further accentuated by certain types of body. In limousine cars, the clatter at certain speeds is well-nigh deafening. When the spring suspension is interposed between the body and the gears, as in the axle mounted transmission arrangement, the nuisance naturally is abated.

Among the first of the American manufacturers to advocate the rear axle located change gear mechanism, and one of the

FIG. 2—MARION AXLE-MOUNTED CHANGE GEAR SET

As a matter of fact, in those cars in which the torsion rod is replaced by a torsion tube, but one universal joint is necessary, owing to the straighter drive which is possible when the transmission is located on the rear axle. Inasmuch as universal joints are notorious "eaters of power," the elimination of one of them, other things being equal, allows of greater power being delivered at the rear wheels. Incidentally, as the drive shaft is longer, and therefore has less angularity, the remaining universal joint has considerably less work to do at all times.

Even though the drive is comparatively straight, however, there is a neat little problem involved in the arrangement of the rods by means of which the gears are shifted.

FIG. 3—EVERITT DIFFERENTIAL-CHANGE GEAR UNIT

FIG. 4—REGAL UNDERSLUNG FRAME, AND AXLE UNIT

Owing to the comparatively large relative movement between the rear axle and the chassis, to which the gear shifting levers are attached, it was forecasted that these parts soon would get out of kilter, but here

that the positive maintenance of the relative positions of all the component parts is assured; no amount of frame twisting can alter the relationship. Add to which the simplicity of locating all the transmis-

most consistent users of the system since, was the Bartholomew Co., the unit as used on the late models of Glide cars being shown in Fig. 1. As may be seen in the illustration, the gears, which provide three forward speeds and reverse, are arranged vertically, which is to say that the lay shaft and its gears are below the driving shaft—an arrangement that is the one most generally chosen with this system of mounting the change gear set. The rods, by means of which the gears are shifted, likewise are arranged vertically one above the other.

The housing in this case really is two housings, one for the differential and one for the gearset, though when assembled and bolted together, the method of joining them being plainly discernible in the picture, the whole forms a compact unit. Lubrication is effected in the usual way, by means of grease, and it is a significant fact that when the cars leave the factory the housing contains sufficient grease to insure proper lubrication for a whole season. Which, briefly, sets at naught the contention that rear axle located change gear mechanisms are likely to be forgotten and thereby suffer

from lack of attention. Here, and in the majority of other cases, the necessity for continual attention is obviated.

In the Marmon rear axle and change gear set illustrated in Fig. 2, the arrangement, while similar in some respects, differs considerably in others. Thus, as in the former instance, the gears are arranged vertically, the lay shaft being below the driving shaft. The axle housing is of pressed steel and access to the differential housing is had by removing the cast aluminum cover, the top of which, designated C, is visible in the picture.

Though it has been contended that one of the disadvantages of such systems is the difficulty of getting at their "insides," the accessibility of the Marmon axle, and several others of similar pattern, goes far to prove that few other systems of mounting

described, the Everitt "30" change gear and differential unit, which is illustrated in Fig. 3, has the gears arranged horizontally, the lay shaft being beside, instead of below, the drive shaft. Three speeds forward and reverse are provided for. The housing is composed of three pressed steel parts bolted together and brazed and riveted to the axle housing and to the torsion tube. The gear shifting rods, A and B, are arranged side by side at the top of the housing, and being above the torsion tube, thus are protected by it. The removal of the cover plate allows free access to both the differential and the change gears.

Illustrated in Fig. 4, the Regal rear axle unit shows graphically the possibility of obtaining a straight-line drive, the under-slung frame and the reduced angularity of the drive shaft when the change gear set

plate at the rear of the housing, and the removal of the gear box cover allows the gears to be withdrawn or inspected when necessary. Three speeds forward and reverse are provided, the gears being arranged vertically with the gear shifting rods mounted one on each side of the torsion tube.

Insuring the entrance of the minimum amount of dust—assuming the somewhat remote possibility of its entrance at such a point—the Stutz unit, illustrated in Fig. 6, reveals a neat arrangement of the gear shifting rods, whereby but a single opening into the casing is necessary. Where the rods, A and B, enter the housing they are arranged one inside the other. Allowing of three speeds forward and reverse, the gears are arranged vertically. In this design also, the drive shaft, in which there is a single

FIG. 5—STEARNS TRANSMISSION DESIGN

FIG. 6—ARRANGEMENT OF STUTZ UNIT

the change gear mechanism are superior to the rear axle location in this particular respect. Everything within the Marmon rear axle housing may be removed in a few minutes without the necessity of disturbing any other part of the car, or even jacking up the rear wheels. Bolted within, to the forward end of the differential housing, a steel plate with integral bearing supports for the differential also carries the pinion bearing and the rear bearing of the change gear set.

It is the removal of this plate which permits the easy and quick dismounting of both differential and gearset without disturbing the rest of the mechanism of the car other than partially withdrawing the drive axles, one of which, D, is shown in the accompanying illustration. As an added protection, the gear shifting rods, A and B, by means of which the three speeds forward and reverse are obtained, are enclosed in an oval, dust-proof housing attached to the torsion tube, the latter serving as a housing for the propeller shaft.

Differing from both of the other axles

is so mounted both assisting in the accomplishment of this result. In this design also, the gears are arranged horizontally, three speeds forward and reverse being provided. The housing is in reality two separate units which, when bolted together, as shown, form a single rigid unit. A slight variation in the arrangement of the gear shifting rods, A and B, also is apparent, the rods being placed one above the other and bent slightly to bring them over to the side of the chassis where they are connected to the gear shifting lever.

In the Stearns rear axle unit, which is illustrated in Fig. 5, a single-cast case serves as a housing for both the differential and the gearset. This housing is firmly bolted within the open truss-like portion of the forged axle, the torsion tube extending from the forward end of the transmission case to a pivoted yoke mounted on a cross member of the frame. The torsion tube encloses the propeller shaft and its one universal joint and serves as both a torsion and a radius rod. Access to the differential is gained by the removal of the

universal joint, is enclosed in a torsion tube attached to a cross member of the frame by means of a pivoted yoke, the tube performing the functions of both torsion and radius rods.

One of the little thought of features of the rear axle mounted change gear unit is the possibility of arranging for direct drive on all speeds. That the application of such a system is not as remote as at first might be supposed, is evidenced by the appearance of several change gear mechanisms in which this result is obtained. Though up to the present time none of these has made its appearance on automobiles, one of them, which also provides worm drive, has been used with some degree of success on motorcycles abroad, and it is not impossible that before a very great time some such system will be in more general use.

But even barring the possibility of obtaining a direct drive on all speeds by the use of this system, the rear axle located change gear unit undoubtedly has advantages possessed by none other, and its popularity is waxing.

"RAMBLERS" HOLD CONVENTION

**Officials and Salesmen of Kenosha Factory
Discuss Plans—Annual Gathering
Marks Organization's Progress.**

Rambler dealers, salesmen, traveling representatives and executives gathered at the factory of the Thomas B. Jeffery Co., at Kenosha, Wis., last week, for the annual convention of the sales and service organization. Sixty-five members of the local and field forces were in attendance and the three days of the convention were filled with "doings" of varied sorts, including many things in lighter vein as well as the

who have long been associated with the company. Those standing in the top row are: G. M. Berry, M. Mattson, C. D. Hagerty, A. L. Stapleton, G. R. Sutherland, Al. Reeke, E. J. Wall, A. R. Rockwell, C. S. Culp, B. F. Spencer, O. Murphy, G. H. Cox, H. F. Lantz, G. Braithwaite.

In the second row from the top are: W. F. Portwine, J. M. Gaffney, R. S. Bennett, C. Sklarek, C. A. Baker, J. K. Bond, F. E. Devlin, Gilbert Williams, F. C. Mock, J. O. McDonald, J. A. Rose, W. C. Burbank, E. S. Jordan, J. P. Zens, R. Jardine.

Those in the third row are: O. G. Formhals, E. G. Soward, H. H. Maddock, F. W. Rosche, T. D. Cobbs, Jr., G. B. Owens, H. E. Tanner, F. C. Bacon, W. S. Simonds, L. A. Poundstone, W. H. Knight, T. B.

freight car. The collision took place at a crossing, where the glare of an electric arc light prevented the chauffeur from seeing the stalled freight train, with the result that the motor car struck the freight car with full power. The framework of the automobile slipped under the truss work of the railroad car and in an instant the latter was lifted off the rails. The automobile suffered a twisted front axle, bent fender and broken lamp, but was able to proceed to the garage under its own power.

Ohio Offers Extended Warranty.

Departing from customary forms, the Ohio Motor Car Co., of Cincinnati, Ohio, is offering in connection with its cars a guarantee against defective workmanship

RAMBLER FACTORY AND FIELD FORCES GROUPED AT THEIR ANNUAL CONVENTION IN KENOSHA, WIS.

serious affairs of the set program. As always is the case with such gatherings, the occasion was one of mutual benefit, of renewed strength and confidence, of much discussion concerning organization plans and of certain disclosures as to the forthcoming product, in the latter of which the public will be permitted to share in due season, it is explained.

The new models are ready, to the extent that they are being shown to dealers, but the formal announcement of their characteristics has not been made as yet. That it will be full of interest is an expectation based on the past and also strengthened somewhat by reason of the fact that the factory force has been augmented during the past year by the addition of several well-known engineers. These include Robert Jardine, one of the older designers in the field; George Braithwaite, formerly factory manager for the Stevens-Duryea Co., and F. C. Mock, formerly assistant engineer for the Dayton Motor Car Co.

The accompanying picture shows the Rambler group on the steps of the factory and includes the faces of many men

Long, I. J. Kinnett, L. E. Rood, R. C. Chase, C. D. Dunham, C. M. LeRoux, G. D. Racine, Z. C. Elkins, H. G. Musgrave, H. P. Thompson.

The fourth and front row includes: J. W. DeCou, M. E. Lebon, E. E. Herring, W. E. Wissler, G. C. Norwood, S. S. Jenkins, I. R. Campbell, C. T. Jeffery, K. J. Leach, W. G. Schultz, H. M. McEachren, P. J. Keating, C. O. Hart, G. A. Ruckert, P. D. Carman, L. P. Kilbourne, G. N. Bliss.

Eight Makers Equipping With Klaxon.

Eight motor car makers are to include Klaxon warning signals as regular 1912 equipment, according to the Lovell-McConnell Mfg. Co., of Newark, N. J., which makes the Klaxon. The list includes Stearns, Columbia, Stoddard-Dayton, Alco, Autocar, Knox, Orson and Benz.

Automobile Derails Loaded Freight Car.

The energy of an automobile driven at high speed probably never was more forcibly illustrated than in an accident which occurred last week in Brainerd, Minn., and in which the automobile derailed a loaded

and material during "the life of the car." It covers every part except tires, rims, radiators, coils, magnetos or batteries, which are warranted by their respective manufacturers. The warranty for the car itself is in the form of a bond signed by the officers of the Ohio company, and is in effect so long as the car remains the property of the original purchaser in whose name it is issued; otherwise the liability as covered by the warranty terminates in one year.

No Room for Cars at Port Limon.

Ten blocks long and five blocks wide embraces the whole territory covered by Port Limon, Costa Rica, and there are no roads outside the city limits, but nevertheless the town boasts two automobiles, says Chester Donaldson, the American consul at that station. The machines are owned by doctors for their practice within the city limits. Donaldson does not think that the size and location of the place justify many more automobiles at present, and judging from the lack of "elbow room" in it, the average automobile manufacturer would hesitate to establish an agency there.

How Overloading the Highway Raises Haulage Costs

It is written that doctors bury their mistakes, while the errors of engineers endure to supervise their own interment; which is more or less true. Many a famous surgeon has more clients under ground than above, but who can name offhand the designer of the Quebec bridge? The fall of that half-completed structure unquestionably is the most notorious instance of "wrong treatment" of modern times. Another that, if less conspicuous, nevertheless contained as great an element of surprise to the engineering fraternity, was the Woodlawn wreck of a passenger train on the New York, New Haven & Hartford Railroad, several years ago, when a passenger train running on schedule time and at its scheduled rate, suddenly jumped the track with disastrous results.

Subsequent investigation showed that the train had been running at about 40 miles an hour when it reached the curve where the wreck occurred. It was being drawn by one of the new electric locomotives that just had gone into service within the local terminal zone. Except for that circumstance there was nothing to indicate a possible cause for the disaster. Other trains of like composition had covered the same tracks at as great or even greater speeds, time and time again. The track was shown to have been in normal condition, properly inspected, continuously used, in every way up to the rigid standards which careful railroad operation in the vicinity of a great city has found to be vitally necessary. What, then, caused the wreck?

Logical deductions would serve to indicate the seat of the difficulty almost as readily as the scientific investigation which speedily followed the wreck. The new electric locomotives, though not too heavy for the roadbed, as at first was suggested, differed from the standard steam engines in that a greater proportion of their weight was concentrated near the rails. The result was that in rounding the curve an abnormal side pressure was exerted on the outer rail, a pressure so far beyond its legitimate resisting power that it was torn away, causing a number of the following cars to be piled up in a splintered mass.

The roadbed was in proper shape and, according to prevailing ideas, without fault; the new locomotive was up to specification and its design presented no intrinsic fault. The whole trouble was that the engine was not suited to the roadbed, or to express the idea in terms of progress, the roadbed was not suited to the requirement of the engine.

The story of this particular wreck might

be used to point any number of morals ranging from religion to rhetoric, but its most relevant application is in illustration of the close relation that exists between the railroad and the rolling stock that runs on it. In modern railroad engineering practice it has become axiomatic that traffic expansion is limited both by rolling stock and trackage and that loading is limited by the condition of the roadbed.

Within the past five or six years revolutionary changes have taken place in railroad development in respect to the strengthening of the roadbeds. Heavier rails, improved methods of ballasting, stronger bridges have been necessitated by the constant increase in traffic demands. Heavier trains and especially increased train speeds have rendered tremendous outlays in this direction absolutely necessary, however unwelcome they may have been to the various boards of well padded and florid directors. A long series of wrecks, blockades and all manner of traffic delays made it apparent that a time had come when better roads were a prime necessity. Their development was indispensable to further progress, even to a bare worrying along in the trail of progress.

Here is a point where the automobile engineers seem to be displaying an inclination to lag behind the traditions of the engineering profession. Discounting "mistakes" of the sort that mark the engineer's burial, the dictates of the craft are that a design shall be developed not individually but as an element dovetailed into the whole system in which it is to operate. There was a time when automobile designs were not homogeneous in themselves, when practically every distinct group of parts, while displaying merit and efficiency in itself, was more or less a misfit as far as the remainder of the assemblage was concerned.

Happily that period has passed, but there remains in the newer field of the commercial vehicle a very evident predilection to build the motor truck as an independent unit rather than as an element in a system. The general result is very much as it was in the days before the complete unification of railroad organization, when one independent department built locomotives, another cars, a third laid track and a fourth tried to maintain an operating schedule. Harmonious working, efficient operation, profitable development, could not be brought about until it became possible to exercise an effective general supervision over the entire system; until the different branches of the great enterprise that is embodied in a transportation system were properly co-ordinated.

One difficulty in the truck industry is that certain manufacturers are so intent on building trucks that will run successfully under certain assumed conditions that they neglect to consider that when they are sold and put into service, they may be made to work under totally different conditions. There is an inclination in the first place to attempt to make one design serve too many purposes. There is also an inclination to overdo in the matter of lading. Not that the maximum capacity truck has been built, but rather that a number of makers have begun to put out vehicles which when loaded are too heavy for the roads.

Truck operating conditions and railroad operating conditions closely parallel one another, but with this difference, that whereas the limitations of the roadbed are definitely known in railway operation, and to a certain extent are susceptible of development with the demands of increased traffic, the common highway is entirely beyond the control of truck manufacturer and owner alike. Better roads are one of the certainties of the future but the highways of the present do not present the uniform conditions that are ideal for motor vehicle operation. Poor pavements may be said to be the source of high truck operating costs—and they are undeniably higher than they ought to be on the average—but highway conditions, relatively speaking, are fixed. Truck design is not.

For a long time the eyes of New York truck salesmen have been turned enviously toward a prosperous and widely advertised terminal warehouse company which had announced its intention of employing motor trucks as a means of linking up the heart of the business district with its somewhat remote but otherwise matchless plant. Such of the plans of the company in question as have been permitted to leak out from time to time have indicated an intention to make the fullest possible use of motor vehicles, while it was likewise evident that it was planned to employ its equipment in a thoroughly practical and efficient manner. Indeed the local tradesmen were keenly aware that whatever the make and type of vehicle selected for the service, considerable business stimulation was likely to result if the project was carried through successfully. It may be imagined, therefore, that the intelligence that the company had abandoned so much of its plan as related to the use of motor trucks was received with considerable disappointment.

Before giving up the idea of using trucks a thorough test was made. Four trucks, "the best that could be bought," in the estimation of the heads of the concern, were

put into regular service and their operation carefully studied. Their performance was regarded not so much in the light of an experiment to determine their fitness, as in the nature of a standardization test, whereby the complete equipment later to be purchased, was to be regulated. Yet after a trial lasting over months it was decided to make no further truck investments for the present. The trucks now in use may not be thrown out at once, but it has been decided, according to an official of the company, that the equipment will not be increased—"until Brooklyn has better streets."

"One or the other of the two larger machines has been in the repair shop most of the time," said the official, in telling of the experiment. He is a man who has given close attention to the motor truck problem from the standpoints of both user and manufacturer, by the way. "In an effort to discover the cause of the enormously high upkeep we were experiencing I studied the conditions very closely, even spending a whole day riding on one of the big machines. And I want to tell you that at the end of that day's work I was literally 'sea-sick' as a result of the pitching and rolling of that truck. It seems beyond reason to expect any mechanism to withstand the effects of such continuous pounding," he concluded.

Disappointing—very. But will this particular terminal company, with its 3,000 feet and more of water front, its 122 warehouses and its 20 miles of private railroad, offering accommodation for upwards of 1,000 freight cars, entirely abandon the plan of delivering its customers' goods in Manhattan, merely because of its failure to obtain satisfactory results with motor vehicles? Answer, No.

How, then, will it manage the transportation problem? By the use of horse-drawn trucks.

Will not the bad condition of the streets prove as much a detriment to horse haulage as it has to motor? No.

Will the company be able to carry out all its haulage requirements with horsed vehicles? Undoubtedly.

Why? Because smaller loads will be hauled and slower speeds maintained.

Truck makers regard it as a peculiar thing that teamsters of long experience, who are accustomed to encountering practically no difficulty with horse drawn trucks, should be afflicted with a mania for overloading motor trucks, and they are inclined, doubtless for good reason, to trace back most of the troubles incident to truck operation to this very cause. Yet there is nothing strange about it. So much of the excessive cost of truck operation as is chargeable to overloading may correctly be set down to lack of experience and to overconfidence in the capabilities of the engine-driven vehicle. But back of that in many cases lies the fact that the vehicle itself is

too heavy for the highway over which it is expected to work.

The effect is two-fold. In the first place it results in rapid depreciation of the truck, and the heavier the vehicle the more rapid is bound to be its rate of deterioration. In the second place, it results in rapid depreciation of the pavement, and the heavier the vehicle the greater its destructive power.

Just as the standards of roadbed equipment have been undergoing a change in railroad practice, so the standards of highway construction are undergoing a change. But in the latter instance the metamorphosis is much slower, as always must be the case where the growth of private and public works is compared. It lies within the power of the railroads to strengthen their rails and bridges as fast as traffic growth warrants the outlay; highway development must wait on the will of the people and the will of the public officials who, figuratively speaking, represent it.

By a recent ruling of Judge Trexler, of Lehigh County, Pa., it is the duty of that county to render its bridges equal to all traffic requirements. Although a certain bridge which had broken down under a motor truck loaded with two tons of flour, was sufficient for all demands when constructed, the judge held that it has become the duty of the county, since the introduction of motor trucks, to strengthen all its bridges to such an extent that they would meet the modern requirement. In that opinion he was sustained by the Supreme Court of the state, and in consequence it is likely that there will be a rapid increase in bridge building during the next few months everywhere within range of the ruling.

That attitude is exceptional. A more common, and perhaps more natural, view is that the employment of heavy trucks is an abuse of public privilege. While the makers and users of trucks raise their voices in execration of the roads, the road makers are beginning to discover something of a menace to their handiwork in the use of increasingly heavy vehicles. The difficulty really is mutual and requires adjustment. When a heavy truck rolls along leaving behind it a trail of rutted asphalt, sunken pavement, broken manhole covers, disordered street railway switches, smashed culverts, broken bridges and deeply furrowed country roads, it is not to be wondered at if complaints are uttered. Likewise it is to be expected that the vehicle will suffer as well as the road.

"We have decided not to go above five tons on any of our trucks," says another man of considerable experience with trucks who is the self-styled "largest buyer of automobiles in the world." "You know it will only be a matter of a few years before there will be legislation forbidding the use of such heavy machines. The streets simply will not stand up under the strain and it is too much to expect the public to suffer in consequence of continuous heavy vehicle

loading. Besides, the upkeep of large vehicles is bound to be exorbitant."

Weight alone is not the only objectionable feature in connection with heavy truck development, however. It is the combination of great weight and high speed that causes destruction to vehicles and highways alike. The relation between laden weight and maximum permissible speed is sadly in need of revision. Some day, possibly an absolute ratio may be fixed through the development of what engineers would term an MV² formula, that is, one in which the load limit is determined by the relation of total weight to the square of the maximum speed. So far, the judgment of the designing engineer has been relied on to fix the speeds of motor vehicles. If he has erred in running to either too great weights or too great speeds, it is because of lack of data to work on.

"No one has any idea how great the wear and tear of speed is on a commercial wagon," a well known truck engineer is quoted as saying. "They complain about how fast a motor truck wears out as compared with their old horse-drawn trucks and tell about the cost of upkeep, but not one of them ever looked into the reasons and realizes that speed is the main element of the 'pace that kills.'"

After an experience with semi-trailers, that is, with former horse-drawn wagons in which the original front wheels had been replaced with a four-wheeled motor truck or tractor, this authority has discovered that the trailer part of the unit is apt to prove exceedingly short lived. Hence his conclusion that successful semi-trailer practice demands the use of special construction from end to end. In other words, he concludes that there is nothing inherent to the self-propelled vehicle which should render it less durable than one that is made to be drawn; its short life must, therefore, arise from the heavy loads that it is called upon to bear and from the high speeds at which it is driven.

"It stands to reason," he declares, "that a cart built to travel behind a team of walking horses at a gait of about 2½ miles an hour is not strong enough to travel over rough pavements at the motor rate of say 10 miles. It would rack such a wagon to pieces, and I don't believe that it would last on the average 30 days under the strain sustained by a motor truck. If they want speed they must realize that it is bound to be procurable at the cost of wear and tear. What I object to is their expectation that a motor truck will do the new work and last as long as a slow-moving horse-drawn truck did."

Yet the advent of the motor truck has been acclaimed as the beginning of an era of accelerated traffic. So it is, but perhaps there is a tendency on the part of the public and the industry, too, to expect too much all at once.

An Englishman returning to London af-

ter a fifteen years' absence was moved to great enthusiasm.

"I am astounded at the enormous access of speed to London traffic particularly, and to transport generally, that the self-propelled vehicle has brought about," he vociferated. "Take it from me that the swiftest city in the world today is undoubtedly London, and my belief is that the advent of the motor vehicle has not only built up the pace of the transport and the general conveyance, but has infused a spirit and dash into general business affairs that is something remarkable. At the present time, business in the great American centers is lethargic, compared with what one sees here.

"I am very much surprised, however, that nothing has been done to replace the horse vehicle. The facilities offered by the superb roads of England keep you people on this side at the top notch for trying to produce a vehicle to replace the locomotive, and you are neglecting to replace the horse. You know that prime cost and upkeep squares with increases of speeds, and with a speed that is from three to four times the speed of the horse you are doing the best work to recoup the cost of a comparatively expensive vehicle in make and upkeep.

"I have always a sneaking regard for the old governed vehicle that could not exceed 14 miles an hour, that could run, if necessary, on steel tires, and that could travel a good many thousand miles without costing an income to maintain. Of course, this applies to either three- or four-passenger vehicles, or to light loads of from 10 to 15 cwt.; my opinion is that the next developments will be the production of vehicles that will absolutely replace the village butcher's cart, and the well-to-do man's governess cart, which will not go more than 10 or 12 miles an hour, and which will be indifferent to the way their wheels are shod. I am sure it is a future manufacturer's ideal to reach the inevitable stage of the entire abolishment of the horse. These types will do it. Such vehicles can be made and sold at a profit at £80; and they will have no more expensive upkeep than a horse and vehicle to pay.

"When everyone in England was carried away with the idea of making five-ton and six-ton motor lorries, Dan Simpson and I practically stood alone in advocating the one-ton and two-ton loads that today are responsible for the success which the commercial vehicle has assumed; thus developing the fact that a light load carried safely and at a fair speed is a more commercial solution of the proposition of commercial self-propelled trucks than are heavy loads carried at very slow speeds."

A fifteen-year absentee from New York or any other metropolis probably would experience some of the same feelings and might exhibit the same enthusiasm. It is wonderfully inspiring, this speeding up of traffic, with all that it implies of business expedition, economy and great accomplish-

ment. At the same time there is more than a chance that the very weight of inspiration may carry the automobile industry and the business world too far before the natural reaction to stable types shall have set in, and that the lesson involved may prove unduly expensive.

When a truck builder concentrates the bulk of the useful load of his product on the rear wheels, as is common practice in Europe just now, it is a tacit admission that steering, and the protection of the power plant cannot satisfactorily be accomplished by overloading the front of the machine. To increase its capacity the designer has recourse to the expedient of loading up the rear axle. When a truck builder hooks on a semi-trailer on the wheels of which from a third to a half of the useful load is borne, it amounts to an admission that he cannot make an efficient four-wheeled unit to carry the burden. Yet in European truck practice—in which, by the way, the builder of rubber tires frequently is relieved of an admittedly staggering problem by the use of steel bands on the wheels—truck speeds are reduced to a mere crawl. With better highways than America can boast, heavier loads undoubtedly are carried with far greater economy.

Even so, the European builders do not have to withstand the demand for high speeds that Americans require. The truck operators of this country apparently have come to expect a five-ton truck to run nearly as fast as a three-ton vehicle, and a ten-ton truck to run at speeds that would be destructive to a vehicle of half that capacity. It is a product of the American fault of haste, perhaps. Truck builders deplore the tendency, as they do that of overloading. But it is to be observed that no truck will run faster than it is geared to go and the spectacle of a seven- or eight-ton load of coal being whisked through a busy street at speeds verging close on the legal limit for pleasure cars, is one that cannot be charged up entirely to the mistaken judgment of the operator nor to the recklessness of his driver.

What is required is definite knowledge as to the maximum practicable limits of both weight and speed; when, for example, it would pay in terms of total cost per unit of haul to substitute two half-sized trucks for one full-sized one. Or, to put it another way, the industry is yet to learn what are the profitable maximum axle loadings for successive rates of speed. Once those figures have been learned, even approximately, the remaining problem will prove easy enough of solution.

Given a maximum loading capacity for a given speed, it is possible to increase actual haulage capacity by increasing the number of vehicles, by adopting semi-trailer practice, by the employment of six-wheeled vehicles and finally by the use of trailers and even road trains. There is an exact and limited field of usefulness for

each class of equipment, none the less exact because the determination of those limits is a task as yet unperformed. There is absolutely no limit to the size and carrying capacity to which motor truck building can be applied, but there is a limit to which it can be applied profitably. As loads increase and speeds increase, so does depreciation, both of the vehicles and the roads. Not only that, but above certain, at present undetermined, limits, increases of wheel load involve increased wheel penetration to a degree that raises traction resistance to a prohibitive point.

It has frequently been pointed out that truck equipment must be made suitable to the service for which it is to be employed; that the determination of load-units, speeds, gearing and the number of vehicles in a given installation, must be carried out in accordance with the nature of the business and also with an eye to local topography. It is high time that the problem be carried a step further and that the real economy of the loading problem be worked out with reference to specific highway conditions. Automobile engineers must consider the relation of the vehicle to the roadbed as carefully as do railroad engineers, and for exactly similar reasons.

The Cooling of Trucks in Warm Weather.

Despite the provision of large cooling surfaces on the radiators of commercial vehicles, it is observed that many drivers find that good results are obtained when the sides of the bonnet are removed during extremely hot weather, or the doors left open. While there is no particular objection to this expedient, save the esthetic one—supposing that it really does any good—it would be a better plan to increase the speed of the fan when special cooling facilities are required. In most cases the substitution of a larger driving pulley on the end of the crank shaft and a new belt are all that is required to accomplish the desired end.

DeDion to Produce a Smaller "Eight."

Having experienced considerable success with its 35 horsepower, eight-cylinder V-motor, the DeDion company, of France, has announced its intention of producing a similar model of even smaller power for the forthcoming fall. The new engine will have cylinder dimensions of approximately $2\frac{3}{4} \times 5\frac{1}{2}$ inches bore and stroke, with a rating of 24 horsepower.

Chain Maintenance Saves Power Losses.

Careful motor truck drivers are learning to pay close attention to the condition of the driving chains. While chain drive, when in good order, provides one of the most economical forms of transmission known, the amount of power absorbed when the links are clogged with dirt or when the sprockets are out of line is almost beyond belief.

TWELVE MODELS FOR SPEEDWELL

Varying Bodies Applied to the One 50 Horsepower Chassis—Details of the 1912 Offerings.

To the Speedwell Motor Car Co., of Dayton, Ohio, belongs the distinction of having developed a design of sufficient stability to warrant its continuance from year to year. Not that the distinction is alto-

gether a rarity in the industry, but rather that the number of manufacturers who succeed in pursuing such a policy is sufficiently small to warrant calling attention to their position. By its new announcement the Speedwell company declares a practical renewal of its entire line. As heretofore, this includes no less than a dozen different models, all of which share in common the properties of a single 50 horsepower chassis.

As far as mechanical changes in the construction of the mechanism are concerned, they are limited, practically speaking, to a slight increase in the diameters of the valve stems and valve stem guides, and to the introduction of larger shafts and non-adjustable annular ball bearings in the gearset. Such other alterations as have been carried out are wholly in the nature of detailed refinements.

One of the effective models of the new line is the semi-racer equipped with a small tonneau, which is shown in one of the accompanying illustrations. The machine has the straight-line style of body, with hooded dash and full doors, that is found on all modern touring cars, but in low seating arrangement, large mud-guards and general rakishness, has just the suggestion of stability under high-speed running conditions that is desired by motorists who drive with reference to the "high spots" only.

The torpedo model, the latest edition of

which also is depicted, is distinguished by unusually high sides, a straight-line body effect, and a sloping bonnet which serves to render the extreme height of the sides less conspicuous than it otherwise would be. The entire line ranges from the two-passenger roadster and distinctive three-passenger "duck-boat" model up to the seven-passenger touring and limousine models. A noteworthy type is the so-called "Cruiser," which is an elaborated four-passenger touring machine, built with

in connection with double-jointed shaft drive and a special form of full-floating axle in which a one-piece drawn steel housing supports the dead weight of the chassis and houses the moving parts. All wheels, and even the steering pivots, are mounted on Timken roller bearings. Unusually large braking surface is provided, the total area working out a proportion of one square inch of area for every seven pounds weight.

While electric lighting is not standard equipment, the usual oil and gas lamps being regularly provided, special provision is made for the adoption of the more modern system at the option of the purchaser, the Speedwell company having been one of the first to establish a regular mounting and driving arrangement to render the installation of a lighting dynamo a relatively simple matter. Demountable rims of Firestone make, tonneau fittings, tools, lamps, gas tank and horn, are items of stock equipment. On the Cruiser model, a top and windshield, as well as rear shock absorbers, are added to the standard outfit.

Indirect Speed Effects of "Safe-Guards."

Making it plain that there is considerably more to the "bumper" proposition than might casually appear, a handsome booklet concerning the Conover "safe-guard" has been issued by the Lovell-McConnell Mfg. Co., of Newark, N. J. One of the interesting points brought out is that in addition to the protection such a device affords the car, the lamps, the motorist and the pedestrian, it makes safe a higher average speed for motor trucks in congested traffic than is otherwise possible. Emphasis is placed

THE SPEEDWELL SPECIAL—A SEMI-RACER WITH SMALL TONNEAU

NEW SPEEDWELL TORPEDO FOUR-PASSENGER TOURING CAR

tern, with 5 x 5 inch cylinders, cast in L-pattern, the valves thus being located on the same side. Bosch dual ignition is used, as is a force-feed lubricating system in which much confidence is placed. A three-speed selective sliding gearset is employed

on the guarantee that "if any part of the Conover safe-guard—defective or damaged through carelessness, collision or abuse—is returned within two years from date of factory tag, it will be replaced entirely free of charge."

ESTABLISHING NEW BODY STYLES

Details of Stoddard-Dayton Designs Reveal
Ingenious Features—Novel Devices
Add to Engine Efficiency.

Affording additional particulars as to the nature of the distinctive new features which have been embodied in the new Stoddard-Dayton cars, the full details of the line, which just have been issued by the United

equal comfort to persons who are either extraordinarily long or extraordinarily short of limb, the exceedingly simple device of rendering the seat frame or double bucket moveable has been resorted to. As the accompanying skeletonized view plainly indicates, the seat proper is considerably wider than the supporting frame work or box. The seat being formed to a degree independent of the high sides of the body, and suitable means of attachment between seat and base provided, it follows that it

cars. Among them, the runabout type, which is applied to several of the five chassis which complete the line, is distinguished by a novel storage compartment which is worked into the body structure behind the seat in such a way as to be thoroughly accessible, despite the circumstance that the rear deck is equipped with a cylindrical gasoline tank, in the rear of which a spare tire carrier is mounted.

To accomplish the desired result, the entrance to the compartment, which is of sufficient size to accommodate several full-grown suit cases, is through the rear of the seat. One of the accompanying pictures shows the method of construction besides illustrating the appearance, both external and internal, of the machine. To gain access to the space it is only necessary to tip forward the seat back, thereby opening the door to the compartment. To effect this, it is also necessary to tip forward the small goggle and map box, which is handily contrived to form the division between the two seats.

As in the past, the arrangement of the enclosed cars has been given considerable thought, the result being the development of an inside-driven coupe that is equally accessible from either side. The body lines chosen for the purpose suggest those of the extension brougham, the door being in the center of the car. This circumstance, coupled with the fact that the seat is extended a trifle forward of the door, enables an ample entrance to be effected behind the steering wheel, which is mounted on the right side of the vehicle.

Another of the enclosed bodies which is decidedly striking in its way, is the new seven-passenger limousine designed for the Special chassis, which is described as being equipped with "half" front doors. The front portion of the machine, on this ac-

States Motor Co., for the Dayton Motor Car Co., of Dayton, Ohio, which is one of its components, indicate unusual attention to minor structural points. While the development of a Knight motor in six-cylinder form, as told in last week's announcements, is by far the most striking feature of the new product, it is by no means the only one which is worthy of special atten-

tion. Perhaps of equal interest to the average motorist is the innovation in the way of adjustable front seats, which has been introduced in the Knight, Special and Saybrook models, which are the three of greatest power and the most pretentious of the line.

is a comparatively simple matter to alter the position of the seat to the extent of varying the distance between the front edge of the cushion and the dash. The same view also indicates the liberal design of upholstery, showing the location and depth of the cushion springs, as well as the general scheme of stuffing and tufting. The extra tonneau seats, it will be

tion. Perhaps of equal interest to the average motorist is the innovation in the way of adjustable front seats, which has been introduced in the Knight, Special and Saybrook models, which are the three of greatest power and the most pretentious of the line.

In order to render the front seats of

observed, are arranged to fold down against the back of the front seat, leaving the floor perfectly level and unencumbered with rods, supports or other mechanical parts.

Several other of the new bodies are possessed of ingenious features, as well as those which are applied to the three large

count, is really only semi-enclosed, but owing to the manner in which the outline of the vehicle has been drawn, the effect is almost precisely the same as that obtained with the fully-enclosed, or double type of limousine.

In connection with the mechanical details of the line, the construction of the new

Knight motor is remarkable in that in addition to being the first six-cylinder engine of sleeve-valve class to be built in this country, it also is one of the first of its class to be built with its cylinders cast in groups of three. With the external simplicity of the Knight type, this construction results in an exceedingly "clean" engine. The accompanying illustration shows

but which has now been subjected to several improvements. A simple form of gear pump lubrication is provided, which embodies a single-line delivery to a header or manifold, from which the lubricant is distributed to all crankshaft, camshaft and commutator bearings in proper amounts. As the speed of the pump varies with the speed of the motor, it follows that the rate

The effect secured is much the same as that employed in the blast pipe of a locomotive to secure a draught for the fire under the boiler. As each cylinder discharges its exhaust contents into the manifold, the gas rushes out of the nozzle orifice with sufficient violence to create a partial vacuum in its immediate vicinity. The succeeding cylinder to fire discharges its

EASY ENTRANCE TO STODDARD-DAYTON COUPE AND THE "SPECIAL" LIMOUSINE WITH HALF FRONT DOORS

the exhaust side, which is absolutely stripped of all external attachments, saving only the exhaust and water manifolds, the former having long, sweeping bends, and the latter connecting directly to the centrifugal pump, which is on the auxiliary line shaft. The magneto, which is carried on a bracket at the front end of the motor, is driven by the same shaft motion for

of oil feed is closely proportioned to the needs of the engine. For varying the rate of flow, when adjustment to meet unusual running conditions is required, there is a regulating device mounted on the outside of the crank case in an accessible position.

Another of the new engine features is a special form of exhaust manifold which is designed with a view to expediting the

exhaust into an atmosphere of lower pressure than the outer air, therefore, as a result of which its outflow is more rapid than otherwise would be the case. The same action alternately developed in each of the cylinders, results in literally "pulling" out the contents of each, and is particularly effective in removing the last portion of the exhaust during the brief instant of practi-

EXHAUST SIDE OF STODDARD-DAYTON-KNIGHT "SIX" AND THE VALVE-IN-HEAD TYPE ENGINE

which is derived from the crank shaft by the aid of a silent chain, as in all Knight engines. The hot-air intake for the carburettor and the mounting of the cooling fan are other details of interest.

The standard form of Stoddard-Dayton engine, which is used on the Special and Saybrook models, is one that has given good service in former models of the line,

movement of the waste gases and is thought to be of material assistance in clearing the cylinders. For this purpose, the connections from the individual cylinders, instead of being coupled directly to an open header, are joined to separate chambers, each of which terminates in a nozzle, the four nozzles of the different cylinder connections being concentric.

cally no piston movement, just prior to the closing of the valve.

The complete line consists of the Knight, Special, Saybrook, Stratford and Savoy models, the first-named being the Knight-engined six-cylinder model, the remainder being of four-cylinder construction and of 58, 48, 38 and 28 horsepower, respectively—the last two equipped with L-type motors.

ADJUSTING THE ARTILLERY WHEEL

Problems Presented by Shrinking of the Wood—Several Methods of Overcoming the Difficulty.

Practically the only automobile component that would seem to have been inherited without material change from the days of carriage history is the wheel. Yet even wheel construction has undergone important changes, though not such as appear to the eye of the casual observer. Improved methods of manufacture principally and a few changes in design have made it possible to continue the use of the wood structure in the face of enormous increases in load and even with the addition of the heavy driving stresses. With the development of the heavy commercial vehicle, however, the wheel problem is receiving renewed attention at the hands of the designers. Likewise the owner and operator finds that he must give the wheels an amount of inspection and adjustment which hitherto has not been required. Indeed, granted the proper instruction of operators in the care of wheels and it is quite likely that difficulties with the running gear would be measurably reduced even without any alterations in construction.

Despite the use of kiln-dried wood and the application of most thorough manufacturing processes the fact remains that wood wheels continue to "dry out" during the hot midsummer weather with more or less disastrous results. It also follows that because of the heavier loads which must be borne, the loosening of commercial vehicle wheels is a more serious matter than the corresponding effect when manifest in the lighter pleasure cars. In the latter it frequently happens that about the only noticeable effect is the chipping of the paint around the hub plates, showing that a certain amount of working between the spokes is taking place. With truck wheels, on the other hand, even an almost unnoticeable amount of lost motion soon may develop into a dangerous weakness, as is indicated by the creaking and groaning of the structure.

As in the days of the horse and buggy, which, in some sections of the country are fast being forgotten, the source of the difficulty is a certain small percentage of moisture which is present in the wood at the time the wheel is made, and which gradually is absorbed by the atmosphere following long periods of dry weather. The immediate result is a shrinkage of the wood, which not even a thorough paint protection can avert, the reason being that the paint film is very likely to be broken at the joints, owing to the yielding of the wheel to heavy strains, such fissures being the probable ultimate cause of the looseness.

The old-time remedy for a rattling wheel was to stand it in water long enough for the wood to swell—at best but a temporary expedient. When the shrinkage had progressed so far that frequent soakings were insufficient to keep it "tight," it became necessary to reset the tire, thereby drawing the entire wheel structure into closer adjustment. Neither of these processes being wholly practicable of application to automobile wheels, it follows that the difficulty may become even more troublesome if the wheel is neglected once it begins to show signs of looseness.

Fortunately one remedy presents itself which is inherent to the artillery type of construction universally employed in motor vehicle wheel construction. That is the setting up of the hub plates. This has the effect of tightening the wheel in the center, thereby taking up any side play and restoring it to truth. It does not effect a circumferential adjustment, however, and therefore the adjustment should not be too long delayed. Looseness of the spokes at once is revealed by the chipping of the paint around the hub plates, as already indicated, and as looseness invariably is accompanied by working of the parts under load, it follows that once the paint has begun to go the hub bolts should be tightened without delay and the broken paint properly patched to exclude moisture and prevent disintegration. "Working" of the spokes inevitably means wear and further looseness and if the hub is neglected it will not be long before the outer ends of the spokes begin to loosen in the felloe. With the automobile wheel this difficulty is beyond the practical remedy.

It is to be observed that as between the artillery and the carriage type of wheels there is this important point of structural difference, that whereas the former is tightened from the hub, the latter is drawn inward from the felloe by the resetting of the tire. A carriage wheel, the spokes of which have worked loose in the hub is about as difficult a structure to restore to complete efficiency as an artillery wheel, the spokes of which have become loose in the felloe. For the artillery wheel fitted with a flat felloe band, such as is employed with certain types of demountable rim and also of the sort required by the new standard specifications of the Society of Automobile Engineers for solid tires, of course the resetting of the band is a possible, though difficult and expensive possibility. As practically all need of such renewal may be obviated by keeping the hub plates tight, it follows that that care becomes one of the most important elements in vehicle upkeep.

Generally speaking there is but one point to be observed in performing the work, namely that of maintaining uniform tension on the bolts, as otherwise the wheel may be "thrown out" on the side of greatest tension. Where a driving sprocket is carried by the hub bolts it is equally important

to see that the sprocket is not drawn out of truth in the process, and also to make sure that the studs have not become loose in the wheel. Should this have occurred it may be necessary to replace them with larger ones, or to bush out the holes.

In rare cases where the repair has been too long delayed, so that the spokes have loosened circumferentially, it is possible to effect an adjustment by inserting thin iron wedges between the spokes and thus setting them up. In doing this, however, it is necessary to work with extreme care, driving all the wedges at the same time by turning the wheel and distributing a uniform number of blows among the wedges. Otherwise there is danger of bringing a bending strain on some of the spokes at the point of attachment to the felloe.

As a precaution in extremely dry weather, some authorities advise hanging wet bagging over the wheels when the vehicle is left standing in the garage over night; this expedient, together with frequent washing, being thought sufficient to prevent the hub from drying out. As a matter of fact a well-made wheel should not require such treatment, particularly if the precautions of keeping the hub tight and the wood well painted at the joints, be rigidly observed.

Practically the only striking modification in wood wheel construction that has been introduced in heavy vehicle work is that of a British inventor, who has produced an adjustable wheel so designed that it is assembled within the felloe and rim and expanded outwardly, the rim not being shrunk on in the usual manner. Wheels of this type may be readjusted by wedging at any time, and are said to have given good service. No less than 700 such wheels are reported to be in use by the London General Omnibus Co. Up to this time, however, they have not become known in this country, nor is their fame by any means universal abroad.

Utilizing Hacksaw Blades for Rasps.

To produce a rough and ready rasp, useful in a variety of ways while doing odd jobs about the car, someone has suggested the utilization of broken hacksaw blades. To form the rasp all that is necessary is to fasten six or seven blades together by slipping a small bolt through the eyes in the "good" ends, the broken ends being bound together with tire tape, which is wrapped around a sufficient number of times to form a convenient handle.

Why Gasolene Should Be Turned Off.

As a possible method of reducing fuel consumption it has been suggested that when the car is to be left standing for a considerable length of time it is wise to turn off the gasolene at the tank. While the purpose of the procedure is to prevent the evaporation of gasolene through the carburetter, it has an additional advantage in the measure of safety which results in case of fire.

AUTOMOBILES "STARVED" IN QUITO

Disconcerting Effects of High Altitude on Motor Cars—Why Special Carbureting Systems Are Needed.

A city boasting about sixty automobiles, not one of which may be said to work in an entirely satisfactory manner, forms the basic allusion of a discussion of certain extraordinary operating requirements that has been going the rounds of the scientific and technical press abroad and has just reached this country. It is not the case that the city in question, which is Quito, the capital of Ecuador, has, as might be supposed, been afflicted with the introduction of a large number of cars of poor design, but rather that the motor vehicles there in use, which may be supposed to be fully up to the average, are not suited to the unusual climatic conditions which prevail.

"Quito is at an altitude of 9,000 feet," says the Literary Digest in one of its composite articles derived from foreign sources, "and is on so abrupt an elevation that when the traveler goes a little way beyond it he descends far toward the plain. A trip of any distance means a descent of three or four thousand feet. The result is that Quito, which has about sixty automobiles, has not one that works well; if they are adjusted so as to run properly in the city, they have a very small radius of action. Besides, as water boils at 187 degrees Fahr., and as the sun is often so hot as to roast eggs in the open air, motors are quickly stopped by overheating.

"Dwellers on the lower levels around Quito have other troubles to deal with, such as the extraordinary range of firearms discharged in the city above, . . . the propagation of sound to great distances (military music being heard five or six miles, and striking clocks thirty to thirty-five miles). Barometers seem indifferent to meteorological variations. A 24 horsepower automobile climbing to the heights refuses 8 per cent grades, and has to be pushed up by the passengers. The lamps go out from lack of oxygen unless a large hole is made around the wick.

"Practically it is necessary, in these automobiles, to increase the size of the radiator and to cool it by means of a powerful ventilator. The motor must be provided with special gear to climb hills. And, above all, to assure at every altitude a proper composition of the explosive mixture fed to the motor, a carbureting system is needed that will regulate the admission of air and gasoline according to the atmospheric pressure, or, more simply, a combination of several carbureters, differently regulated, which may be put into service by the chauffeur in succession, according to the indications of a portable barometer."

Principally, of course, the difficulty is one of carburation, the lower the barometer the smaller the charge induced during each suction stroke. The effect, which is familiar enough to those who have had experience in mountain-climbing, is thus explained:

"The air being rarefied, the mass of the detonating mixture that is drawn in and then acts on the piston is smaller than at sea-level. It may be said that in an explosion motor the power developed is proportional to the pressure indicated by the barometer; at 18,000 feet the barometer falls to half its normal height (or to about 15 inches), and an automobile or aeroplane motor will give only half its normal power. Again, at great altitudes, water boils below 212 degrees; it evaporates and does not stay in the radiator; the cylinders thus run the risk of overheating."

In a general way, the motor in high altitudes is "starved" for lack of oxygen, very much as a human being is affected under similar circumstances. On this account the term "mountain-sickness" has been applied to the loss of power in a motor in the high hills. The modification of the mixture to suit the special requirements, through the application of special carburetter adjustments, as operators in mountainous regions are forced to do, however, is only a partial remedy. Since the density of the air is less than at lower altitudes, it follows that the compression pressure will be lower by a corresponding amount. Therefore to obtain equally good results in high altitudes, the clearance volume of the cylinder should be decreased in addition to the other modifications that commonly are employed, such as increasing the radiator capacity and altering the mixture. This, naturally, is a permanent expedient.

Turkey Spending \$8,000,000 on Roads.

With a certainty of subsequent effect involving improved conditions for the use of motor cars, Turkey is now paying great attention to the construction and repair of roads. In telling of what is being done, American Consul General G. Bie Ravndal, at Constantinople, says:

"Up to within the last two years the roads were noted for their wretched condition and lack of repairs. There was no system of regular road building. When the constitution was declared, about three years ago, the minister of public works caused a survey to be made of the roads of the country. Recommendations were submitted to parliament, which voted \$8,325,345.60 for the construction of about 6,214 miles of roads in the Empire. Of this mileage, two-thirds are old roads to be repaired, and the balance are new roads. The amount of money appropriated is very inadequate, and it is estimated that twice the amount of money will be required for the successful completion of the roads. The roadbed is prepared for a width of 20 feet, and from six to eight inches of crushed stone is laid about 12 feet wide, the top surface being

about three inches of sand. The maximum grade allowed by contract is 5 per cent, but the contracting companies very frequently carry the grade to 7 per cent."

Extent of Berlin's Automobile Population.

Statistics just issued by the German Statistical Bureau for the year 1910 give the number of automobiles in use in Greater Berlin as 6,397, or 20 per cent of the cars running in the whole kingdom of Prussia, or 11 per cent of all cars in the German Empire. Of these 6,397 cars, 5,312 are used as passenger cars, while the remaining 1,084 are motor trucks and light delivery wagons, the latter with 700 representing 68 per cent of the total commercial vehicles. Of the passenger cars 717 are motorcycles, tri-cycles and side cars; 1,172 are of eight horsepower or under; 1,789 have from 8 to 16 horsepower; 1,613 from 16 to 40 horsepower, and 21 are of more than 40 horsepower. Of the commercial cars 700 are light delivery wagons having less than eight horsepower; 229 more than eight and less than sixteen horsepower; 147 between 16 and 40 horsepower, while only nine exceed 40 horsepower.

Tall Title for Commonplace Purposes.

Under the impressive title of the Societe Generale de Banque et de Credit Automobile, Ltd. a \$500,000 company has been registered in London. Strange to relate its declared purpose is to carry on business as "proprietors, manufacturers and agents for the sale of, and intermediaries between, buyers and sellers of motor cars, carriages, omnibuses, vans and cabs, aeroplanes, airships, etc."

Vancouver Buys Many American Cars.

An American automobile manufacturer, who has been cultivating the market of Vancouver, B. C., with considerable success, is reported by United States Consul General David F. Wilber, of that district, to have sold two carloads, or 25 machines, during the last nine days of last July. Representatives of other American builders are said to be equally successful.

How Dirt Gets Into Fuel Tanks.

The accumulation of dirt or other foreign substances in the gasoline often may be traced to negligence on the part of the person who fills the tank in failing properly to wipe the top of the tank before the filler cap is removed. Though the amount of dirt on top of the tank may be almost microscopic, it is well to take the precaution.

Organizing Bus Line for Mexico City.

Mexico City is to have a new bus line which will be inaugurated with a mixed equipment consisting of six horse-drawn stages and four motor buses, each of the latter accommodating 36 passengers. The concession for the project was obtained by Dr. Samuel Espinosa de los Monterose.

Rambler

Motor Cars

Rambler
Sixty-four

IF you drive a Rambler the pleasure of your outing is not converted into drudgery by tire trouble. The Rambler is the only American car equipped with the Spare Wheel. Fitted with a perfect inflated tire, it may be quickly and easily changed for a wheel with a damaged tire. No tiresome pumping in the hot sun or cold rain and you avoid the dirt so disagreeable to the well groomed. This eliminates worry about tire trouble which so often mars a trip. Every feature of the Rambler is designed for the owner's comfort, safety and convenience. The Offset Crank Shaft enables you to throttle down on high gear no faster than a man usually walks; to glide along quietly in crowded traffic without frequent gear shifting and obviates the necessity of rushing the hard pulls through sand and up grades. The Straight Line Drive saves power; big wheels and tires give added comfort and tire economy; the brakes are large enough to provide a feeling of security and the safety starting device protects you from injury while cranking.

A telephone message to the nearest Rambler representative will bring a Rambler to your door for inspection. A postal will bring you the new catalog.

The old tiresome way

The Thomas B. Jeffery Company
Main Office and Factory, Kenosha, Wisconsin
Branches: Boston, Chicago, Milwaukee,
Cleveland, San Francisco, New York.

The modern Rambler way

New York Dealers: The Rambler Automobile Co.
of New York, 38-40 West 62nd Street, New York

993,291. Gas Engine. John A. Burnham, Jr., Boston, Mass., assignor to Barbour-Stockwell Co., Cambridgeport, Mass., a Corporation of Massachusetts. Filed Nov. 28, 1906. Serial No. 345,430.

1. An explosive engine comprising a cylinder or combustion chamber, opposed reciprocating pistons located therein, a driven shaft where to said pistons are operatively connected to impart rotation thereto, inlet and exhaust passages communicating with said cylinder, valves controlling said passages, said valves being opposed to each other and disposed substantially parallel with said pistons, and operating means for said valves symmetrically disposed with respect to the axis of the engine.

993,326. Gearing. Joseph P. Lavigne, Detroit, Mich. Filed Aug. 24, 1910. Serial No. 578,790.

1. A device of the character described comprising a casing, a shaft in said casing, a nut in said casing formed in parts and having screw-threaded engagement with said shaft to be moved longitudinally within said casing by the turning of said shaft, gibs between the outer sides of the parts of said nut and the adjacent sides of the casing movable with said parts, and springs exerting an outward pressure on said gibs and an inward pressure upon the parts of said nut.

993,336. Construction of Warning Horns. Felicien Berton, Paris, France. Filed Apr. 1, 1907. Serial No. 365,689.

1. A warning horn comprising a cylindrical box, a trumpet protruding from said box, a reed and partition within said box forming a sonorous conduit of gradually increasing section between said reed and said trumpet.

993,375. Short Circuiting Device for Magneto Electric Igniting Apparatus for Explosion Motors. Gottlob Honold, Stuttgart, Germany. Filed Aug. 7, 1906. Serial No. 329,569.

1. In an electric ignition device, the combination, with an igniter, an electric generator having a rotatable armature winding provided with two terminals, and a permanent connection between the armature winding and one side of the igniter, of a conductor connected to the other side of the igniter, a ring comprising a plurality of contact devices separated from each other by insulation, a brush arranged to contact with the contact devices, means for producing a relative rotation between the brush and the ring, said brush and one of the contact devices being arranged to make an intermittent connection between the aforesaid conductor and one terminal of the armature of the latter parts, each of said valves being adapted to close its port or to prevent a flow of water through said casing.

993,379. Shock Absorbing Vehicle Spring. Elmer H. Johnson, New York, N. Y. Filed Feb. 10, 1910. Serial No. 543,137.

1. The combination with a main spring formed of a plurality of superposed leaves of successively increasing length, said springs having their ends extending up-

wardly and said main spring having means for connecting it at the ends and middle thereof to a vehicle, of an auxiliary spring comprising a leaf attached at its middle to the upper face of the uppermost leaf of the main spring, but less in length than said main spring, said leaf on each side of its middle being formed with a plurality of successive upwardly bowed portions.

993,388. Spring Wheel for Automobiles. Frank J. MacCarthy, Seattle, Wash., assignor of one-third to George I. Meagher and one-third to E. S. Blackwell, Seattle, Wash. Filed Aug. 30, 1909. Serial No. 493,150.

A spring wheel comprising a rim having a plurality of grooved blocks secured to its inner face arranged in pairs, pins extending inwardly from said grooved blocks having transverse bores, apertured lugs formed on the sides of said blocks, a hub cut octagonally to form seats, spokes formed of compound bent spring members having apertured ends arranged in the blocks of the rim, and having means for securing their ends to the hub, cotter pins extending through the pins of the blocks, and tapering pins extending through the apertured lugs of the blocks for securing said spring members in position.

993,466. Vehicle Wheel. Gregory J. Spohrer, Franklin, Pa. Filed Aug. 24, 1910. Serial No. 578,654.

1. The combination with a wheel axle, of a wheel including a cylindrical hub, a cylinder carried by the hub, a piston in said cylinder having a stem extending through the hub and the end of the wheel axle, and means for admitting air to one end of said cylinder to yieldingly support the piston therein.

993,470. Ball Bearing. Willis C. Swift, Hinsdale, Ill. Filed Aug. 25, 1909. Serial No. 514,476.

1. In a ball bearing, inner and outer bearing rings having a raceway formed therebetween, bearing balls operating in said raceway, separators interposed between adjacent balls, but normally out of bearing contact therewith, and means arranged outside of the raceway and on opposite sides thereof for supporting said separators in position for the bearing balls to contact therewith at their mid points between the contacts thereof with the inner and outer bearing rings.

993,471. Ball Bearing. Willis C. Swift, Hinsdale, Ill. Filed Oct. 8, 1909, Serial No. 521,768. Renewed Mar. 27, 1911. Serial No. 617,233.

1. In a ball bearing, an inner and an outer bearing ring having a raceway formed therebetween, and bearing balls operating in said raceway, of socket pieces applied to the balls at the ends of the axes about which they revolve, and means for yieldingly restraining said socket pieces from endwise movement.

993,472. Equalizing Drive Mechanism. Herman Tenham, Brandon, Wis. Filed Mar. 12, 1910. Serial No. 548,817.

1. In a differential clutch mechanism for the traction wheels of motor driven vehicles, the combination with driving mechanism of a set of driving and driven clutch members, one provided with a resiliently mounted projection and the other having an oscillatory cylindrical member socketed therein and adapted to be adjusted to interlock with said projection on either side of the latter, and means connected with the driving mechanism of the vehicle for auto-

matically adjusting said cylindrical member.

993,516. Carburetter. William M. Gentle, Greenwood, Ind. Filed Dec. 2, 1909. Serial No. 531,022.

1. A carburetter including means for supplying and mixing air and fuel to form an explosive gas, a casing through which the explosive gas passes from the carburetter, a valve extending across said passageway that tends to open under the influence of the suction of the engine, means tending to close said valve, an opening in said casing to the outer air in advance of said valve, a valve for closing said opening that is pivoted on the side of the valve toward the outlet to the carburetter so that back-firing will tend to open said last-mentioned valve, and yielding means for holding said valve normally closed.

993,536. Shock Absorber. George Cushing Martin, Los Angeles, Cal. Filed Nov. 4, 1909. Serial No. 526,260.

1. Two relatively rotatable members, a floating shoe between said members and frictionally engaging one of said members, and resilient means including a toggle joint and arranged between the shoe and the other member, and operable by relative rotation of said members to force the shoe with yielding pressure against the member with which the shoe engages.

993,559. Electrically Propelled Vehicle. Robert Siegfried, Pittsburgh, Pa., assignor, by mesne assignments, to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a Corporation of Pennsylvania. Filed Aug. 10, 1908, Serial No. 426,392. Renewed Mar. 20, 1911. Serial No. 615,657.

1. The combination with a pair of truck wheels and a driving motor, of speed-reducing gears between the respective ends of the motor armature shaft and the truck wheels and a flexible connection between like members of the two sets of gears.

993,611. Electromagnetic Power-Velocity Ratio Device, Particularly Applicable for Driving Automobiles. Albert Henry Midgley, Forest Gate, and Charles Anthony Vandervell, Acton Vale, England. Filed May 7, 1909. Serial No. 494,663.

1. An electromagnetic power velocity ratio device consisting of in combination a dynamo armature, a motor armature, and one set of field magnets common to the two armatures, the motor armature being surrounded by said magnets, the motor armature being fixed and the dynamo armature and field magnets being adapted to move relatively to one another and to the motor armature, means for exciting the field magnets, and means for conveying the current generated by one armature to the other armature, substantially as described.

993,632. Tire Case. Bernard A. Alperin, New York, N. Y., assignor to Lafayette B. Gleason, Delhi, N. Y. Original application filed May 5, 1909. Serial No. 493,998. Divided and this application filed June 21, 1909, Serial No. 503,291. Renewed Dec. 13, 1910. Serial No. 597,150.

1. The combination with a car body and a running board, of a drum shaped case having one circular side hinged, a frame member secured on the back of the case and having hinge members to one side in alignment, one of the hinge members being pivoted on the running board and the other hinge member being pivoted to the side of

the car whereby the case can swing outwardly from the car, and a foot rest on the frame on the opposite from the hinge members for engagement with the running board.

993,652. Hydraulic Transmission Mechanism for Automobiles. Clyde J. Coleman, New York, N. Y., assignor to Conrad Hubert, New York, N. Y. Filed Dec. 14, 1906. Serial No. 347,895.

1. The combination, with a hydraulic motor, of physically distinct and functionally interchangeable induction and eduction passages constructed and arranged to act upon the motive liquid in whichever of the passages that acts as an eduction passage and not to act upon the motive liquid in the other passage which acts as an induction passage, irrespective of the direction of flow of the motive liquid through the passages and the motor.

993,770. Carburetter. Julius L. Fritz, Philadelphia, Pa., assignor of one-half to Amos H. Oman, Philadelphia, Pa. Filed Feb. 11, 1911. Serial No. 608,087.

1. In a device of the character stated, a casing having a mixture outlet, a mixing chamber in said casing having air and fuel inlets, fuel supply for said mixing chamber, a supplemental air inlet having communication with said mixing chamber, a supplemental fuel nozzle, and suction controlled means for controlling the supplemental air inlet, and on a predetermined movement of said means controlling the amount of fuel passing to the supplemental air inlet.

993,823. Baggage Truck. Tracy V. Buckwalter, Altoona, Pa. Filed Apr. 9, 1910. Serial No. 554,404.

1. A truck comprising a frame having a lower section and elevated end sections, traction wheels housed within said end sections for carrying said frame, and a motor housed within one of said end sections and connected with the wheels therein.

993,849. Device for Resiliently Supporting the Frames and Bodies of Vehicles. John T. Lister, Cleveland, Ohio, assignor of thirty-five one-hundredths to Worthing Hoyt, Cleveland, Ohio. Filed Oct. 24, 1910. Serial No. 588,636.

1. A device for resiliently supporting a vehicle body upon an axle, comprising a hollow tubular member, plungers within the hollow tubular member at opposite ends thereof, the one of said plungers being operatively connected to the body to respond to vertical motion, the other plunger being operatively connected to the body so as to respond to horizontal motion of the body, substantially as described.

993,862. Transmission Gearing for Motor Cars. Joseph Osario Michaud, Fort Kent, Me. Filed Nov. 10, 1910. Serial No. 591,732.

In a transmission gearing such as described, a shaft, a cup gear having a set of internally cut teeth mounted on the end thereof, means for shifting said cup gear

in a transverse plane, a universal joint in the shaft to transmit rotation through various angles to a driven member, a square shaft with means for connecting or disconnecting the same with a source of power, an internally squared sleeve slidable on the said square shaft and suitably journaled in a support, a cone of gears mounted on the inner end of the said sleeve and extending within the cup gear, a shaft parallel to the aforementioned shaft, one end extending within the cup gear and the other end journaled in the aforementioned support, a reverse gear mounted on the inner end of the shaft and meshing with the smaller one of the cone gears, a second set of internally cut teeth mounted in the said cup gear to mesh with the said reverse gear when the said driven member is to be reversed, a positive clutch member formed on the inner end of the slidable sleeve, an opposite clutch member forced on the cup gear, and a collar mounted on the outer end of the slidable sleeve, together with an operating yoke engaging said collar, substantially as and for the purposes set forth.

993,863. Crank Case Construction for Gas Engines. James T. Moltrupp, Beaver Falls, Pa. Filed Apr. 24, 1908. Serial No. 428,942.

1. In a gas engine, a crank shaft, a plurality of cylinders having their pistons connected to said shaft, and a crank casing, said casing comprising separate rigid heads having bearings for the crank shaft, and a sheet metal casing secured to said heads and provided with seats for the cylinders, said heads having inwardly projecting longitudinal flanges to which the sheet metal casing is secured, said flanges being extended underneath the adjacent cylinder seats of the sheet metal casing; substantially as described.

993,942. Suction Priming Cup. Orville Emanuel Appel, Bushton, Kan. Filed Feb. 5, 1910. Serial No. 542,266.

1. A priming means for explosion or hydro-carbon engines comprising a cut or reservoir of a capacity to contain only sufficient fuel to supply the engine until the regular charges from the carburetter can reach the explosion chamber, said cup being provided with an unobstructed pipe leading from a point near the bottom of the cup to a point above the level of liquid in the cup when the latter is filled to the normal height, said pipe being of a length to enter the intake conduit of the engine into close proximity to the explosion chamber of the engine.

993,956. Starting Device for Engines. Harvey Burns, Lebanon, Ohio. Filed Oct. 7, 1910. Serial No. 585,851.

1. In an engine starting device, the combination of an engine including a shaft, a spring-rotated gear wheel, a rotating rewinding element co-axial with the gear wheel, independently movable arms mounted to swing from the axis of the wheel and element, a pinion on one of the arms permanently meshing with the gear wheel, a gear on the shaft with which the pinion is adapted to be engaged, an idler on the

other arm adapted to be moved into and out of engagement with the shaft to transmit motion from the latter to the element for re-winding the spring, and a common actuator movable in one direction for actuating one arm in starting the engine and movable in the opposite direction for actuating the other arm to re-wind the starting spring after the engine is started.

994,019. Drive-Axle. Jonathan D. Maxwell, Tarrytown, N. Y. Filed Sept. 13, 1907. Serial No. 392,629.

1. The combination with a tubular transverse member provided with an intermediately situated differential gear case and with a driving shaft revolvably mounted therein, of brackets affixed to the outer ends of said transverse member and extending upwardly therefrom and studs secured in the upper ends of said brackets and upon which the traction wheels are journaled, said brackets formed with inwardly projecting upper and lower tubular arms, the inner ends of the studs being secured in the upper ones and the outer ends of the transverse member being secured in the lower ones, said lower arms projecting inwardly into juxtaposition with the gear casing and forming supports for the vehicle body.

994,024. Shock Absorber. Arthur L. Mitchell, Portland, Me. Filed Feb. 3, 1910. Serial No. 541,204.

1. A shock absorber for vehicles comprising a plate disposed at right angles to the axle of a wagon, a spring interposed between the axle and the plate at their intersecting point, and a substantially triangular member astride the bow spring of the axle and having its divergent ends connected to uate movement on said plate is permitted. the ends of said plate whereby a slight arc

994,498. Reed for Automobile Horns. Frank Bishop, St. Louis, Mo. Filed July 30, 1910. Serial No. 574,675.

1. A reed comprising a body of segment shape in cross section, a vibratory tongue facing the open side of said body, and a guard facing said tongue.

**ABSORPTION RUMORS PUNCTURED**

U. S. Motor Disclaims Intention of Wholesale Mergers—Overland Emphatically Nails False Report.

Rivaling the products of the once busy Detroit rumor factory, which in its time put out a tremendous line of reported mergers, absorptions and consolidations, another batch of absorption rumors is being distributed in the trade concerning alleged negotiations by the United States Motor Co. to get additional big properties for its already very complete group. The grapevine telegraph has been busy with reports, mentioning Willys-Overland, Thomas and Stevens-Duryea as parties to negotiations, whereas, as a matter of fact, the real negotiation mill was seldom if ever more idle and unused than at present, or the likelihood of absorptions more remote.

Officials of the United States Motor Co. itself know nothing of any negotiations with any of the companies named. It is known that some individuals have interests in both United States Motor and Thomas at the same time, but this by no means spells absorption or domination by the former. Both the Willys-Overland and Stevens-Duryea rumors are dismissed as unaccountable, and George W. Bennett, general sales manager of the Willys-Overland Co., in a telegram from Toledo, puts a decisive end to the report involving his company, as follows:

"Absolutely nothing in rumor. No negotiations of any description have been made and, furthermore, the Willys-Overland Co. is not for sale."

Knight Tires to Be Made in Canton.

Another source of automobile tires is to be made available to the trade and the public by the Knight Tire & Rubber Co., of Canton, O., of which Charles Knight, of the Republic Stamping & Enamel Co., in Canton, is the head. The concern was

incorporated last May with \$300,000 capital and has commenced work on the erection of a large brick and concrete factory, with a 550-horsepower engine equipment. The plant will be devoted to automobile tires exclusively.

Miller Opening a Branch in Albany.

What will be his twelfth branch store is to be opened in Albany, N. Y., by Charles E. Miller, manufacturer, jobber, exporter and importer of automobile supplies, whose home office is at 97-103 Reade street, New York City. The Albany branch will be in a new building at 135 Central avenue, and will be ready for business in October.

More Money for Jacobson-Brandow.

Considerable inflow of money into the Jacobson-Brandow Co., of Pittsfield, Mass., which makes ignition equipment, is promised as the result of the efforts of a local committee to raise subscriptions for the company's stock. Pledges aggregating \$10,000 additional capital from local subscriptions have been secured.

Long Horn Going to Long Island.

The G. Piel Co., of New York City, making the Long horn for automobiles, is to move from its present location at 363 Rider avenue. The factory will be located in the Metal Stamping building, at the Boulevard and Thirteenth and Fourteenth streets, Long Island City, on October 1st.

Stewart Opens a Cleveland Office.

For the benefit of its Stewart speedometer customers in Cleveland, O., the Stewart & Clark Mfg. Co., of Chicago, Ill., has opened an office in that city, at 1849 Euclid avenue. It will be in charge of H. A. Ungar, who has been traveling the Northern Ohio territory.

Cortland Wagon Now in Pittsfield.

The Cortland Motor Wagon Co. has moved from Cortland, N. Y., to Pittsfield, Mass. The change affords the company many advantages, including more room and better shipping facilities.

ARMY OF DEALERS TO DETROIT

Studebaker Spending \$100,000 on Special Trains for Its Agents—Come From All States.

In magnitude quite overshadowing anything of the sort ever before attempted in the automobile industry, the Studebaker Corporation, through General Manager Walter E. Flanders, has commenced an "at home" to its dealers that in its carrying out includes the transportation of every E-M-F and Flanders dealer in the country to the Studebaker factories at Detroit, at the company's expense, in order that they may see how the cars are made. There are some 2,500 of these dealers, and the expense of taking them from their home cities to Detroit and back again will be about \$100,000.

The scheme, which was put into actual operation this week, contemplates taking the dealers from the respective districts, in groups of about 200, on special trains, composed of steel Pullman sleepers, observation car and dining car. In each case the special train is taken to the E-M-F siding on Piquette avenue, and serves as the sleeping quarters for the visitors during a two days' stay in Detroit. The schedule calls for an arrival in Detroit at 6:45 a. m. and a departure on the following evening at midnight. Twenty-five or more of these special trains will be employed, some of them from the Pacific Coast and still others from New England. They will arrive in Detroit at successive periods during the ensuing two months, until the whole list of dealers has been taken care of.

The first contingent arrived on Monday, from the States of Georgia and Alabama, having started from Atlanta and Birmingham, respectively. They were met by Flanders and other officials of the company and were taken in automobiles to the Fellowship Club for breakfast. The morning was spent at plant No. 1, where E-M-F

cars are made. Following lunch at the Pontchartrain, they went to the ball game, and after dinner on the Hotel Tuller roof they boarded a steamer for a lake ride. On Tuesday, their second day, they visited plant No. 3, where the Flanders is produced, as well as Nos. 2, 5 and 8, which have to do with pressed steel parts, bodies and tops. Lunch was served at the Detroit Golf Club, and in the afternoon the Southerners rode with testers out to Pontiac and Orange Lake, visiting the farm owned by Flanders, where dinner was served. Trolley cars brought them back to Detroit in time to get aboard their special before it pulled out at 11:59 p.m.. Each visitor wore a white badge with his name, and blue badges marked the company's officials. Printed programs and seats that were assigned to each dealer by name in the automobiles and trolleys prevented any confusion or delay. The same general character of procedure will obtain with the succeeding delegations.

The schedule so far made up is as follows: August 31, Memphis, Tenn. and Louisville, Ky.; September 5, Philadelphia, Pa., and Washington, D. C.; September 6, Chicago, Ill.; September 11, Dallas, Tex., and Oklahoma; September 14, Kansas City; September 18, Indianapolis, Ind.; September 21, Minneapolis, Minn.; September 25, Fargo, N. D.; September 29, Des Moines and Sioux Falls, Iowa.

Haynes-Knutson to Be a Distributor.

Harvey S. Haynes, who has done business in Minneapolis for the past nine years as the Haynes Automobile Co., and John N. Knutson, of the Ideal Auto Co., St. Paul, Minn., have combined forces under the name of the Haynes-Knutson Auto Co., 219 South Sixth street, Minneapolis. The firm will do a general automobile distributing business throughout the entire Northwest, and has arranged a long term contract as distributor for the Cole "30-40" throughout Minnesota, the Dakotas, Western Wisconsin and Montana. It also will probably take on a cheaper line of cars and will handle commercial vehicles of some standard and well known make.

Mason Motors Starting in Flint.

Organized a few weeks ago, the Mason Motor Co., of Flint, Mich., already has secured a plant, on West Kearsley street, and is making ready to commence the manufacture of motors for automobiles. The building occupied by the company has four floors, with a total of 22,800 square feet. Arthur Mason is the general manager of the concern.

Alpena Elects Its 1912 Officers.

The Alpena Motor Car Co., of Alpena, Mich., through its directors, has elected the following officers for the ensuing year: Richard Collins, president; William Krebs, vice-president; W. B. Robinson, secretary-treasurer and general manager.

Changes Among Prominent Tradesmen.

S. Wallis Merrihew, who has been president and editor of Automobile Topics, is withdrawing from that connection. He has not as yet disclosed his future plans.

R. J. Buell, formerly advertising manager for the Regal Motor Car Co., has become associated with the Willys-Overland Co., at Toledo, Ohio. He will be assistant advertising manager.

Edward Jarvis has been appointed manager of the Chicago salesrooms of the Lozier Motor Co., of Detroit, Mich. He succeeds J. H. Palmer, who has gone into business for himself.

Leslie B. Sanders has become the sales manager of the Lion Motor Car Co., Adrian, Mich., which makes the Lion car. Until recently he was a district representative of the United States Motor Co.

Percy W. Hood, at present with the American Distributing Co., has resigned to accept a road position with the Timken Roller Bearing Co., of Canton, O. He will make the change on September 15th.

L. L. Barnes, who recently resigned as a district manager in the South for the Hudson Motor Car Co., has been engaged as a Southern representative for the Metzger Motor Car Co., of Detroit, Mich. He will make his headquarters in Atlanta, Ga.

W. Bonsor has become supervisor of parts in the factory of the Stevens-Duryea Co., of Chicopee Falls, Mass. For some years he was connected with the factory of the Daimler Motor Co., Ltd., at Coventry, England, and more recently he was with the Packard Motor Car Co.

H. B. Groves has resigned as manager of the United Motors Des Moines Co., which is the Iowa State branch of the United States Motor Co. He has found it desirable to devote his whole time to the Interstate Auto & Supply Co., which has its headquarters in Sioux City and branch houses in other cities in Iowa and South Dakota. He is the principal stockholder in the concern.

A. E. Morrison, one of the veterans of trade, is now the factory director of the Cole Motor Car Co., of Indianapolis, Ind. His duties give him a position second only to President J. J. Cole. He resigned the position of sales manager of the Pacific Motor Car Co., at San Francisco, to accept the Cole offer. Morrison graduated from bicycles to automobiles at Waltham, Mass., subsequently represented the Peerless at Boston, and later had a large hand in the affairs of the Taxi Service Co., of Boston, before going to the Coast.

Sanbert Trucks in the Metropolis.

Metropolitan representation for Sanbert one-ton trucks, which are made by the Sanford-Herbert Co., of Syracuse, N. Y., has been effected by placing the New York City agency with the Bell Bros. Co., which has opened a showroom at 1876 Broadway.

The Sanford-Herbert Co. is closely related to the LeFebvre Firearms Co., of Syracuse, J. F. Durston being president of both concerns. The Sanbert truck has been marketed in Central New York for two years, but its sale is now being extended by Thomas M. Pritchard, the sales manager. He has established agencies in Boston, Pittsfield and New London, as well as New York. The truck has a three-cylinder, vertical, two-cycle, air-cooled motor, a planetary transmission and double side chain drive.

Remy to Extend Service System.

Having established "service stations" in a number of the principal automobile centers, the Remy Electric Co., of Anderson, Ind., has declared for a policy of placing similar stations in other of the larger cities as rapidly as possible. The "service stations" or branch houses carry a complete line of Remy magnetos and devices, each house being in charge of an expert, who, with several expert mechanics, sees that Remy equipment on cars in his territory receives whatever attention is necessary. They inspect the equipment, give advice as to care and usage and make any necessary adjustments.

Poss to Make Trucks in Anhut Plant.

The Poss Motor Co., of Detroit, Mich., which filed its articles of incorporation this month and already is preparing for active manufacture, is to produce trucks of a capacity of from 1,000 to 1,500 pounds, selling at about \$800. The concern is occupying the old Anhut plant at 504-508 Howard street. Frank R. Poss, one of the organizers of the Abbott Motor Co., of Detroit, and vice-president of the Detroit baseball team, is the president. The other principal stockholders are Robert R. McKinley, Joseph M. Ness and George W. Baile.

Henderson Concentrating on Cole.

The Henderson Motor Sales Co., of Indianapolis, Ind., general sales agents for the Cole "30-40," made by the Cole Motor Car Co., Indianapolis, announces the discontinuance of the handling of any other make besides the Cole. The great volume of business in connection with the Cole has made it necessary to concentrate on the one line.

Promoters in Erie Promise Elixer.

Promoters from St. Louis, Mo., are in Erie, Pa., indicating their intention of putting up a plant in the latter city for the manufacture of a car styled the Elixer. The men are Charles E. Furn and Randolph S. Cook.

Bretz Western Office Moves.

The Western office of the J. S. Bretz Co., of New York, has been removed to 504 Ford building, Detroit. It will remain in charge of J. W. Hertzler, the Bretz Western representative.

ARRESTS MAY SOLVE TIRE THEFTS

Automobile District Robberies in New York Aggregate \$100,000 in Short Period—Two Alleged Thieves Caught.

Helping in some degree to solve the mystery of tire thefts in the automobile district of New York City, which in a comparatively short period have aggregated over \$100,000, what are regarded as important arrests were made by the New York police early on Monday morning of this week, when two alleged tire thieves were taken. It is thought that they may be members of a large gang which is supposed to be disposing of stolen automobile tires to some of the less savory of the cut-price houses.

Complaints have been made to the police daily for some time about the numerous thefts from salesrooms, garages and supply establishments where tires are to be found, and on Monday morning Detective Burgess saw five men coming out of a house at 831 Eleventh avenue. Two of them were carrying tires. The detective caught these two men, and when they resisted drew his revolver and took them to the station. While they were giving their pedigree at the station, Edward Kierske, secretary of the Wilson Motor Co., 540 West Fifty-eighth street, telephoned a report of the theft from his place of tires corresponding to those carried by the men. The prisoners are James Alwell, 20 years old, and James Scallon, who is 19. They were charged with burglary, on Kierske's complaint, and before Magistrate House on Monday were held in \$2,000 bail each for further examination.

Take Abbott-Detroit for New England.

For the New England distribution of Abbott-Detroit cars, the Abbott Motor Co., of Detroit, Mich., has closed a contract with W. M. Jenkins & Co., 288 Columbus avenue, Boston, Mass., which latter concern only recently relinquished the Mitchell line after representing it for seven years. The Jenkins company is one of the three pioneer automobile dealers in the New England States.

Speers & Riddle to Leave Wheeling.

The Speers & Riddle Co., with headquarters in Wheeling, W. Va., having arranged for a large production of six cylinder T-head motors for the automobile trade for 1912, is arranging to unite all its interests at Glendale, where the factory is located. The company's supply business and building in Wheeling will be sold and the office force moved to Glendale.

Continental Motor Going to Detroit.

The Continental Motor Co., of Muskegon, Mich., is completing arrangements to move the factory from that city to Detroit.

The officers of the company will change their places of residence correspondingly. Among those who are to take part in the translocation are B. F. Tobin, president; R. W. Judson, vice-president, and E. J. Warner, secretary.

Mansfield Concern Dies A-Bornin'.

Even before it reached the stage of bringing forth any cars, the Forth Motor Car Co., of Mansfield, O., has made an assignment to J. E. LaDow, an attorney. The liabilities are placed at \$1,000 and the assets consist chiefly of one automobile assembled from parts makers' products and which was to be the prototype for the company's machines, provided it were successful in interesting local capital.

Refinishing Project in Grand Rapids.

Promising to give dealers and the trade in Grand Rapids, Mich., special facilities and service in the refinishing of cars, W. R. Link, of the Adams & Hart Co., and Fred Hicks are promoting a company to do a general automobile refinishing business. It is proposed to capitalize at \$30,000, and several of the local automobile agencies have been pledged to take stock.

U. S. Motor in Restaurateur Role.

For the accommodation of its employees in the Brush Runabout Co., the Alden Sampson Mfg. Co. and the Gray Motor Co., the United States Motor Co. has opened a restaurant in Detroit. Four hundred can be taken care of at one time. The restaurant is of the "self-serve" type, equipped with the most modern facilities, and is not "force feed."

Third Dividend for Thrall Creditors.

General creditors of the Thrall Motor Co., of Detroit, Mich., are receiving from the Detroit Trust Co., trustee in bankruptcy, a third and final dividend, amounting to about 9.8 per cent. Two previous distributions of 10 per cent each have been made, so that altogether as against the liabilities of \$24,600 the creditors receive about \$7,250.

Waloff Considers Mankato Location.

The Waloff Motor Truck Co., of Minneapolis, Minn., which for the past two years has been developing a truck, is making a proposition to Mankato, Minn., to establish a factory there. The concern when organized in the fall of 1909 had a capitalization of \$100,000, but on the first of this year the capitalization was made \$200,000.

Motor Delivery for Biloxi Merchants.

Keeping pace with advanced methods, the merchants of Biloxi, Miss., are to dispose of their horses and wagons and will contract with a local motor delivery concern to deliver their goods to their customers. The delivery company will be capitalized at \$10,000, and the merchants in many cases will be stockholders.

GENERAL MOTORS BACKS LANSDEN

Veteran Electric Wagon Designer to Develop Electric Trucks at Pontiac—Takes Some Associates With Him.

Showing that the General Motors Co., too, is alive to the possibilities afforded in the electric truck situation, the company has secured John M. Lansden, a veteran electric designer, and around him will build a manufacturing organization for the production of electric trucks of from one to six tons capacity. Lansden organized the Lansden Co., of Newark, N. J., in 1904, and began the building of Lansden electric wagons at that time, continuing until very recently. His future productions will be manufactured and marketed by the electric division of the General Motors Truck Co., the latter having been incorporated a month or so ago as a selling company for commercial vehicles produced by the various companies under General Motors control. The plant will be at Pontiac, Mich., where also some of the General Motors gasoline commercial vehicles are manufactured.

Lansden takes with him a number of his associates who have co-operated with him in the production of the Lansden electric wagons and trucks. F. A. Whitten, who has been his chief engineer, will act in a similar capacity under the new arrangement, and C. L. Morgan, who until the first of the year was sales manager of the General Vehicle Co., will be identified with the sales and advertising departments. A number of the men in the drafting and engineering departments at Newark will also go to Pontiac.

New York Home for Gramm Trucks.

Gramm motor trucks, made by the Gramm Motor Car Co., of Lima, O., are to be distributed in the New York City district by the Hextor Motor Truck Co., a newly incorporated concern with temporary headquarters at 103 West Fifty-first street. P. K. Hextor is president and general manager of the company. A service building five stories high and basement is being put up, in which will be located the salesroom and a complete garage and machine shop, and where a full stock of repair parts will be carried.

Old Ford Plant in Detroit is Sold.

At a price of \$175,000, the old Ford plant, at Beaubien street and Piquette avenue, Detroit, Mich., has been disposed of to new owners, who as yet wish to keep their identity undisclosed. The sale prompted much speculation, and although the Studebaker Corporation and other similar interests have denied purchasing it, the plant in all probability will be used for automobiles or motorcycles.

San Franciscans Make Self-Starters.

What once were luxuries are becoming more in the nature of necessities to Pacific Coast motorists, as indicated by the increasing demand on their part for self-starting and tire pumping attachments. To help meet the demand another automatic starter has been launched in San Francisco. It is to be made by a new concern known as the Auto Gas Engine Starter Co., a corporation composed of prominent local men, including Peter C. English, B. Goodwin, William C. Tedlie, Dr. G. M. Freeman, Allen Weir, J. A. Clover and J. D. Mouser. The company has established a factory on Golden Gate avenue. The device consists of a combination air compressor and air motor, with air pressure tank. The latter may be drawn upon for inflating tires.

Simmons Hardware to Be \$7,500,000.

The Simmons Hardware Co., of St. Louis, Mo., has announced a plan of reorganization calling for a new company to be called the Simmons Hardware Companies, with a capitalization of \$7,500,000, divided equally into common and 6 per cent. cumulative preferred stock. The present company is capitalized at \$4,500,000.

Red Head Plug Plant in Detroit.

The Emil Grossman Co., of New York City, has removed its Red Head spark plug factory to Detroit, Mich. The plant, consisting of three floors, is located at 844 Woodward avenue, and the local Detroit display room has been changed from 974 Woodward avenue to the same location.

Radiators Classed as Refrigerators.

Changes have been made in the Patent Office at Washington as to the classification of applications and patents relating to motor vehicle radiators and automobile condensers. Separate sub-classes under "refrigeration" have been established for them.

Placing Velie Agencies in the South.

Southern territory for Velie cars, made by the Velie Motor Vehicle Co., of Moline, Ill., is being opened up by Edgar L. Scouten. He is making a tour of the Southern States and is closing a number of 1912 agencies through the Velie branch at Boston.

Mankato May Go to Red Wing.

Negotiations are being carried on looking to a combining of the Mankato Motor Truck Co., of Mankato, Minn., with the Red Wing Motor Co., at Red Wing, Minn. The latter company was previously known as the Red Wing Motor Boat Mfg. Co.

Portland's Puncture-Proof Tire Plant.

Backed by local capital, the Fletcher Tire Co. has begun business in Portland, Ore. It has installed a plant at 125 Sixteenth street, where it will manufacture a puncture-proof tire on a limited scale.

Sumter, S. C.—Epperson Motor Co., under South Carolina laws, with \$2,000 capital; to do general automobile business. Corporators—G. F. Epperson, T. B. Jenkins.

Seattle, Wash.—Automobile Exchange & Repair Co., under Washington laws, with \$2,400 capital; to buy, sell, rent and repair automobiles. Corporators—J. H. Hasbrook, E. P. Whiting.

Grand Rapids, Mich.—Economy Automobile Co., under Michigan laws, with \$7,500 capital; to manufacture, sell, repair, rent and store automobiles. Corporators—F. P. Oswald, H. J. Hagen, H. A. Brink.

Louisville, Ky.—Victor Motor Accessories Co., under Kentucky laws, with \$25,000 capital; to manufacture and deal in automobile accessories. Corporators—D. W. Reinoll, Clarence F. Ott, Alfred W. Ott.

Boston, Mass.—Mark Motor Supply Co., under Massachusetts laws, with \$25,000 capital; to deal in automobile supplies and accessories. Corporators—Mark V. O'Neill, Robert M. Johnson, Randolph Frothingham.

Hopkinsville, Ky.—Cayce-Jones Motor Co., under Kentucky laws, with \$10,000 capital; to sell, store and repair automobiles. Corporators—L. M. V. Cayce, H. D. Dorris, A. B. McDonald, Thomas C. Jones.

Cincinnati, Ohio—Rambler Motor Car Co. of Cincinnati, under Ohio laws, with \$25,000 capital; to deal in automobiles. Corporators—Charles Reed, W. H. Kaufman, Walter C. Reed, George H. Jung, F. D. Ratterman.

Indianapolis, Ind.—Fisher-Gibson Co., under Indiana laws, with \$50,000 capital; to deal in automobiles and other motor vehicles, and in automobile accessories. Corporators—Carl G. Fisher, Cecil E. Gibson, Will J. Dobyns.

Hudson, Wis.—St. Croix Carage Co., under Wisconsin laws, with \$10,000 capital; to operate a garage. Corporators—Emil E. Mayer, William M. Grant, Chris Nickleby, Gus A. Hansen, Oliver E. Lyksett, S. N. Palms, Thomas A. Walby.

St. Charles, Mo.—Boenker Motor Plow Co., under Missouri laws, with \$24,000 capital; to manufacture motor-driven agricultural implements and other motor vehicles. Corporators—H. H. Boenker, Louis Ringe, J. C. Wilbrand and others.

Detroit, Mich.—Poss Motor Co., under Michigan laws, with \$250,000 capital; to manufacture and deal in automobiles, motors and motor vehicles. Corporators—Frank P. Poss, Robert R. McKinley, Joseph M. Ness, George W. Bailey.

New York City, N. Y.—Automatic Fender Co. of America, under New York laws, with \$1,000,000 capital; to manufacture automobile and other fenders. Corporators—William E. McGuirk, Saul S. Meyers, William E. Lowther, all of New York.

Chicago, Ill.—Midland Electrical & Mfg. Co., under Illinois laws, with \$50,000 capital; to manufacture electric lamps for automobiles and motorcycles, and other electric specialties. Corporators—A. Engstrom, A. C. Carlson, F. Dieser, all of Chicago, Ill.

Jersey City, N. J.—The Studebaker Corporation of America, under New Jersey laws, with \$100,000 capital; to manufacture automobiles and other motor vehicles. Corporators—H. G. Latimer, J. B. Marsh, of New York City; J. R. Turner, of Basking Ridge, N. J.

Louisville, Ky.—Wilder Motor Car Co., under Kentucky laws, with \$5,000 capital; to deal in, rent and repair motor vehicles. Corporators—Oscar Wilder, twenty shares; M. R. Wilder, three shares; Percy N. Booth, three shares. Limit of indebtedness has been fixed at \$10,000.

Utica, N. Y.—B. J. Bristol, Inc., under New York laws, with \$1,000 capital, of which \$500 has been paid in; to deal in automobiles, motorcycles and other motor vehicles. Corporators—Benjamin J. Bristol, three shares; Bertha C. Bristol and Myron H. Smith, one share each.

Increases of Capital.

Detroit, Mich.—American Motor Castings Co., from \$200,000 to \$250,000.

St. Louis, Mo.—Motor Wagon Delivery Co., from \$6,500 to \$12,000.

Recent Losses by Fire.

Buffalo, N. Y.—C. W. Miller Taxicab Co.'s garage damaged. Loss \$25,000.

First Fall Show at Detroit Fair.

Detroit is likely to have the first comprehensive display of new models to be held this fall. It will be in connection with the Michigan State Fair, September 18 to 22, and a building constructed particularly for this purpose has been erected on the fair grounds. Thirty-one exhibitors have secured space.

Schurmeier Property to be Sold.

John P. Galbraith has been appointed receiver for the Schurmeier Motor Car Co., of St. Paul, which on August 2nd filed a petition in bankruptcy. Arrangements are being made to sell the property for the benefit of creditors.

Adapt Steam Chassis to Commercials.

H. W. Bell & Co., 146 Woodworth avenue, Yonkers, N. Y., are developing a steam commercial delivery wagon. It is a Stanley chassis, modified and equipped for commercial work.

Henry Sholtz has opened a garage and repair shop in Sparta, Wis.

H. T. Carlson has opened a garage and repair shop at Moose Lake, Minn.

The Morton-Larson Auto Co. has been formed at Ellsworth, Wis. It will do a general garage business.

Charles Brautigam has opened a garage and repair shop at the corner of Fifteenth and Center streets, Racine, Wis.

H. Reed Hawley, of Staatsburg, N. Y., has added a salesroom to his garage and taken the agency for Cole "30" cars.

J. C. Chrisman, of Nashville, Tenn., has opened a salesroom at 145 Third avenue, where he will display the Cole "30" line.

The Logan Square Garage, of 1632 Vine street, Philadelphia, Pa., has been opened to the public. M. Morrison is the manager.

The old skating rink on Broad street, Beloit, Wis., has been turned into a garage and repair shop. Joseph H. Saris is the owner.

Jay Hileman, of the Black Hawk Auto & Repair Co., has sold his business to M. Mether. The concern operates a garage in Waterloo, Iowa.

Work has been started on a new garage on Eleventh street, Chattanooga, Tenn. It will be two stories high and will be occupied by the Ford Sales Co.

Charles H. Carlton is building a garage on Chestnut street, near Forty-sixth street, Philadelphia, Pa. It will be two stories high, 50 x 184 feet, and will cost \$10,000.

George Brinkman has purchased the property at 2820 Locust street, St. Louis, Mo., and will erect a garage thereon. He has taken the agency for Wilcox trucks.

The L. W. Thompson Co., dealers in accessories and supplies, have moved to 204 East Broadway, Louisville, Ky. They formerly were located at 605 Fourth avenue.

E. A. Krause is building a new garage at the corner of Court and Law streets, Allentown, Pa. It will be of brick, one story high, and will cost when complete \$1,500.

Van Dorn & Soss, formerly operating a garage in Seward, Neb., have purchased the O street garage in Lincoln from C. A. Wunderlich. Maxwell cars will be handled.

The Wallace DeWilde Co. has erected a new salesroom and garage at the corner of Clinton and Avon avenues, Newark, N. J. The company has the agency for the Cole "30."

The big Douglas Stables, at 165-67 Clymer street, Brooklyn, N. Y., are being converted into a garage. When completed the building will be occupied by the Williams-

burg Bridge Garage Co., which has purchased the property.

The United States Tire Co. has opened a depot for G. & J. tires at 511 North Capitol avenue, Indianapolis, Ind. Formerly these tires were handled direct from the factory.

Under the style of B. J. Bristol, Inc., a new concern has been formed at Utica, N. Y. Benjamin J. Bristol is the president and will deal in automobiles, motorcycles and other motor vehicles.

The Twitchell Motor Car Co., of Portland, Ore., has moved into larger quarters at Union avenue and Wasco street. It formerly was located at 342 Burnside avenue, where it sold Cole cars.

E. J. Montigny, of the Plaza Garage, Bedford avenue, Brooklyn, N. Y., has discontinued his agency for Abbott-Detroit cars and has taken on the Stutz car. He will cover the whole of Long Island.

H. A. Wetmore, Sioux City agent for Page-Detroit and Chalmers cars, has found his present quarters too cramped and has leased the two-story brick building on Sixth street, opposite the court house. The structure is 70x100 feet.

George K. Kimball, manager of the Franklin Square garage at Dover, N. H., is to continue in charge at that location. Reports to the effect that the garage had been sold led to the impression that the business likewise had changed hands.

J. L. Goff has purchased an interest in the Central Auto & Machine Co., of Knoxville, Tenn., and become its manager. In addition to handling several makes of cars the company will deal in accessories and supplies and maintain a renting service.

M. F. McCoole, president of the McCoole-Mercer Motor Co., of Oklahoma City, Okla., has purchased the holdings of his partner, B. D. Mercer, and will continue the business under the same name. Mercer has retired on account of ill health.

The E. E. Loving Auto Co., of Memphis, Tenn., has found its store at 251 Madison street too small for its needs and has moved into more commodious quarters at the corner of Madison and Manassas streets. The company handles the Cole car.

L. E. Barger, one of the partners of the Rambler Motor Sales Co., of Toledo, Ohio, has left the concern and opened salesrooms on his own account at 623 Madison avenue, the same city. He has taken the agency for Abbott-Detroit cars for Northwestern Ohio.

The Wright Auto Co., of Wichita, Kan., needing more "elbow room" for its garage

and repair shop, has opened larger quarters at the corner of Emporia avenue and First streets. Buick cars will be handled in addition to operating a first-class machine shop.

J. D. Vivian, a carriage dealer at Minneapolis, Minn., and W. S. Bailey, of the Bailey Auto Co., of Detroit, have formed the Punctureless Tire Co. of Michigan, with headquarters at 1193 Woodward avenue. They will handle the Dahl tire-filling material.

Isaac Craft, one of the owners of the Florida Gas Engine & Auto Supply Co., is building a three-story brick garage at the corner of Jackson and Marion streets, Jacksonville, Fla. He will make a specialty in rebuilding and dealing in second-hand cars.

The dissolution of the Campbell Motor Car Co., of Davenport, Iowa, a few months ago has resulted in the transfer of the agency for Overland cars to P. C. Peterson, who operates a garage on Main street. Peterson also has the agency for Pope-Hartford cars.

H. H. Dillon, formerly of the Stitt-Dillon Motor Car Co., of Hastings, Neb., has formed a new company under the style the H. H. Dillon Co., with headquarters at 331 South Eleventh street, Lincoln, Neb. Besides doing a general garage business and dealing in accessories and supplies the company will sell Hudson cars.

Charles Canfield, Algernon Holcomb and Aubert Canfield have formed a company under the style Canfield, Holcomb & Co., and purchased the Whitford garage at Rapid City, S. D. They have the agencies for four different makes of cars. P. Whitford, former owner of the garage, retires from business on account of his advanced age.

Under the style the Everitt Northwest Co., a new concern has "opened up" in Portland, Ore., with temporary headquarters at 688 Washington street, and George C. Nichols as manager. Permanent quarters are being prepared for the company at the corner of Seventh and Couch streets, formerly occupied by the Smith-Cleveland Co.

Baker Brothers, of Geneva, N. Y., and E. H. Green, of Buffalo, N. Y., have consolidated under the style the Baker Brothers Motor Car Co., with headquarters at 846 Main street, Buffalo, and a branch at Geneva. Clarence Baker will be in charge of the Geneva salesrooms, while E. H. Baker and E. H. Green will handle the Buffalo end. Cole "30" cars form the mainstay of the concern.

Some Accessory Makers' Problems.

Big orders from motor car manufacturers for equipment accessories are not always unmixed blessings for the accessory maker who receives them. Sometimes they are too big, and the accessory maker would be shortsighted to accept them, even when he could supply the goods.

This situation is particularly true of accessory makers who are bringing out new offerings that have not as yet gained wide general recognition, but that are sufficiently meritorious to attract the attention of motor car manufacturers as being suitable for equipment. The respective outputs of some automobile factories have grown to such enormous proportions that one or two equipment orders from the larger plants would swamp an accessory manufacturer who did not have extraordinary production facilities.

In cases where the accessory maker, by straining, might fulfill the requirements of

a big-quantity equipment order, but with little or no margin to spare, the decision is sometimes difficult. Despite the closer prices that must be made on equipment orders, there is an attraction about having the whole selling end settled for the season, so that the accessory maker will have no bother with it and may devote himself purely to the manufacturing end. For the time being, at any rate, all the difficult problems relating to a sales organization are eliminated.

There are decided drawbacks, however, if the accessory maker wishes to consider himself something other than a mere departmental manufacturing manager for the car builder. In devoting himself to filling equipment orders that tax his manufacturing capacity, he delays or sacrifices his progress in the general market. If after a period the equipment customer or customers should demand still lower prices or should leave him in the lurch, he is without an outlet and without a sales organization.

For this reason an accessory maker sometimes finds it the best policy to secure his place in the general market first, before attempting to accept equipment business that would take the greater part of his output. By advertising and sales effort directed toward the jobbers, the retailers and the public, he establishes his product as a recognized and standard article and he becomes correspondingly independent of the caprice or vagaries of equipment buyers.

Another advantage of this method, provided he entertains any idea of having a general outlet to the retail trade, is that it does not compel him to disclose rock-bottom quantity prices previous to dealing with the jobbers and the large retailers. Upon introducing goods to the jobbers it is the common experience that the latter will hold off so long as there is a possibility of securing better prices than those offered as the jobbing figures. With no data to aid them, however, they cannot confront the accessory maker with arguments that he is at that very time making better prices to other customers than to them.

If, on the other hand, he is dealing with the automobile manufacturers on an equipment basis, he may be making prices to them that are considerably under the quotation he is willing to make to jobbers. No matter how carefully he tries to conceal these equipment prices, however, the jobbers are pretty sure to know of them,

and to use them as a club. If equipment prices are made to manufacturers after the jobbers have been handling the goods for some time there is very little need for friction. The jobbers may demand concessions equal to those made to the equipment buyers, but if they do not get them they will not necessarily cease to handle the goods, whereas in the first instance they might refuse to take them on.

Elements Lacking in Road Races.

Besides affording an effective and painful illustration of the need of extreme caution in the supervision of grandstand construction, the meet at Elgin served to emphasize the notion that affairs of the sort lack the snap of visible conflict that is inherent to well-conducted track racing. As such affairs go, the races at Elgin were ably and efficiently carried through. Ample provision was made in the way of bulletin boards, the course was kept clear, the roads were in good, though slippery, condition. Barring the lamentable affair of the ill-conceived grandstand and the unavoidable accidents it probably was as successful a meet as could be desired; that is, from the standpoint of management.

Despite its elements of success as a popular attraction, however, a certain indefinable something was lacking to render it thoroughly satisfying. Following the nearly five hours contest of Saturday the familiar objection was voiced that as a race the affair had been tedious and uninteresting. To those thoroughly acquainted with "the game" it proved nothing of the sort. Analysis of the scores indicates that there was competition of the keenest sort; real sport, with all the elements of hazard, opportunity for skill and quick decision and for precise maneuvering that differentiate between a race and a mere exhibition of speed and daring. From the viewpoint of the drivers themselves the officials and the pit attendants it was a race in every sense of the word. Yet without the technical knowledge of the trackside or the ability to figure time allowances and averages quickly and accurately, this element in a measure was unrecognized by the average spectator.

And this, in a word, is the common difficulty with all road races. The old-time thrill which the mere sight of a passing contestant used to inspire has worn away with the seasoned racegoer. Likewise the intense concentration that used to be de-

Sept. 23, Detroit, Mich.—State Automobile Association's race meet.

voted to every move in the contest. Road racing has become more of a diversion and less of an epochal event with the passing of the years and the increased frequency of repetition. The slackening interest of the later portions of any great affair of the sort is a natural outcome of familiarity with the outward aspects of the race and of an equally natural ignorance of the finer elements. These always have existed and always will exist in any great race. To increase the zest of the contest for the average onlooker they should be rendered visible; the relative positions of the cars, the meaning of every change of place, every delay, should be translated for the benefit of the public.

The obvious requirement is for a simple method of scoring and for an equally simple and understandable form of score board. Charts and diagrams in great variety have been prepared with this in view, but all or nearly all have the fault of real or apparent complication. The training necessary to comprehend the automatic score card is a barrier to its success as a means of popularizing the technique of the road race. What would be more to the point would be some form of graphic score board; an equal in simplicity and accuracy of the baseball reporting chart, for example.

We are learning the art of successful promotion and management, we are learning to produce competition of the cleanest and liveliest sort and we are taking such measures as we may to guard the sport against the risks that in the lurid light of the sensational press sometime have threatened to curtail its development. But we have yet to learn to stage long distance races in such a manner as to render them wholly diverting to the casual spectator from beginning to end.

Substituting Names for Model Numbers.

After the manner in which the automobile industry is not unwont to seek inspiration co-operatively, it has been borne in upon a number of manufacturers simultaneously and with suddenness that the mathematical method of designating car models is unfair to the public. Henceforth several makes of car will be distinguished, collectively and individually as types, by names; rather high-sounding and alliterative names, it is true, but still names that are easier to remember and more pleasant to pronounce than the numerical cryptic

which they supplant. Thereby the owner of one of the new cars may describe his possession to the neighbors without resort to a volley of technical sounds, and thereby also the confusion of nomenclature which the industry already bemoans, may be somewhat increased. But no matter so long as the part of the automobile vocabulary which the motorist himself must assimilate is rendered measurably simpler and non-technical.

The idea really began several years ago, of course, when one maker named a model, which is perpetuated to this day, after a certain race that its prototype had won. Up to now, however, the employment of names rather than numbers by way of car designation has attained no conspicuous popularity. Instead, hyphenated horse-powers, antedated yearly marks, distinctive numerals and qualifying numerals have been prefixed to the name of the particular class of vehicle, until considerable skill was required to accomplish a satisfactory translation. One maker even went the length of developing a numerical cipher, in which,

according to the "key," certain digits represented the year of manufacture, certain others the power, others the style or series, and still others the serial number of the individual machine. The result was impressive, to say the least.

The only excuse for the numerical designation was, and is, its usefulness in facilitating correspondence and the ordering of parts. Such systems naturally will continue to be used in shop and sales practice, but they really need not disturb the individual motorist. In the production of some of the older French cars, it was customary to employ a variety of type symbols. A motor of one style, a change gear of another, a chassis of a third, would be combined to form a complete vehicle, which would be known by still another distinguishing mark. Yet it is not on record that any owner of such a car ever bothered to learn more than the characteristic that distinguished the body. That, and perhaps the horsepower, though the latter usually was understood to be a more or less fabulous quantity.

ZENGLE WINS ELGIN CUP IN STRIKING CONTEST

Great Crowd Sees Grant Take Second Place with Hughes, Kane County Winner, Third — Nationals Run One-Two for Illinois, While Aurora Falls to Roberts — Two Meet Death on Course and Grandstand Tumbles.

ELGIN NATIONAL TROPHY—305.26 Miles, 36 Laps

3—A. M. Robbins.....	Abbott-Detroit	2 46 56

Average speed, 53.5 miles per hour.

ELGIN, Ill., Aug. 26.—Elgin has had its fill of road-racing—for another year at least. When Len Zengle, driving his 40-horsepower National, plunged under the banner that marks the starting and finish line of the eight and one-half miles course for the 36th and last time this afternoon, thereby declaring himself winner of the Elgin National Trophy, the two most exciting days this city ever has known officially came to a close. There remained only the exodus of a hundred thousand people and more who had gathered from far and wide for the meet, which was conducted by the Chicago Motor Club and promoted by the Elgin Automobile Road Racing Association. That in itself was more than a passing show.

Zengle's winning drive was accomplished with steady, persistent care, and without a single delay, without a single change of tires and with but one stop, that on his twenty-fifth lap, for gasoline and oil. His method was that which has characterized the driving of Harry A. Grant in the Alco, Vanderbilt Cup winner, and Zengle's nearest competitor in the race, who finished six minutes and 18 seconds behind him. Zengle's time for the 305.26 miles was 4 hours 35 minutes and 39.08 seconds. His average speed was 66.42 miles per hour, or nearly four miles an hour faster than that of Ralph Mulford in winning the corresponding event one year ago. Mulford himself covered the fastest lap of the meet, his seventh, in seven minutes and 13 seconds. It was his only consolation. He finished but one more lap after that momentary triumph and was forced to retire with a burned-out connecting rod bearing when

A REMARKABLE IMPRESSION OF SPEED—ZENGLE'S FLIGHT IN THE WINNING NATIONAL

about half way around his ninth circuit.

Hughie Hughes provided one of the surprises of the day when he finished third in the Elgin event, only 11 seconds behind Grant. Previously he had won the Kane county race of 169.46 miles, making the 20 laps in 2 hours 37 minutes 21 seconds, as against 2 hours 37 minutes 27 seconds, his time for the first 20 laps in to-day's race. The contests for the Illinois, Kane county and Aurora trophies, the first and last at distances of 203.35 and 135.57 miles, respectively, were run concurrently yesterday as a curtain-raiser to the principal race. The Illinois was wholly a National event, Don Herr winning in 3 hours 5 minutes 55 seconds, while his teammate, Charles Merz, was but 1 minute and 51 seconds behind him in point of elapsed time.

Mortimer Roberts, driving one of the two Abbott-Detroit entries, captured the Aurora trophy in 2 hours, 31 minutes 11 seconds, just eight minutes ahead of Frank Kulick, who piloted a Ford.

While Zengle, Herr, Hughes and Roberts were winning respectively the Elgin National, Illinois, Kane county and Aurora trophies in the two days' meet, two drivers and one mechanic were killed and six or seven spectators are temporarily laid up from injuries received. All in all there was sufficient excitement to last Western motorists for a long time, for with the death of Drivers Ireland and Buck and Mechanic Jacobs came a collapse of a section of the immense grandstand, letting close to a thousand people down to earth from heights of from one to 12 feet.

PEARCE (COLBY) MAKING FAST SPURT DOWN HILL WITH MERZ (NATIONAL) CLOSE BEHIND

The officials of the two promoting bodies for weeks had been making preparations for the big event. They had widened, smoothed and oiled the roadway; they had eased the turns; they had shut off the farms by fencing; they had built substantial and commodious judges' and press stands, in fact they had done everything to make the event a howling success.

As was the case last year portable grandstands were used—the same that were used at Chicago's recent military tournaments and the aviation meet, and which heretofore never—so far as recorded—had given way. But in order that the grandstand could be placed on a level, to make up for the unevenness of the cornfield, the West end was built up three or four feet, being placed on posts set in the ground and, it is believed, improperly braced. When Grant was coming down the homestretch at the end of his first lap fully a thousand people arose to see and to give greeting.

At this instant, and without a word of warning, with hardly an outcry, with hardly a cracking of timbers, the West end, embracing some ten sections of the stand settled, slowly and wave-like, with hun-

dreds of feet and arms aloft. It was over in a moment. People stood transfixed, while Zengle, Buck and Wishart and other race drivers whisked by at 70 miles an hour.

The militiamen were alert and crowded back the few who attempted to break on to the track and to stampede, and be it said to their credit they quickly subdued the attempt. The people in the remaining portion of the grandstand did not, strangely enough, become at all panicky and this notwithstanding the fact that it was apparent that at least several score of people must be killed or at best maimed. Still they sat, except a very few, while aid was rushed to the unfortunate mixed up in the debris. Little by little people began pulling themselves out from among folding chairs and as fast as possible those not hurt were requested to give room for the rescuers.

In the meantime the officials had become wildly excited. Starter Wagner directed the yellow flag to be waved to warn the drivers of danger, but a couple of overzealous officials—and there was a surfeit of officials both on and off the track—grabbed a couple

of the checkered flags and waved them in the face of at least three of the drivers, causing them to stop. This meant that all had to be stopped, and the race restarted.

The restart was delayed 50 minutes and in the meantime the hospital corps was busy giving first aid. Ambulances took away a couple of those having suffered most, while several touring cars were pressed into service to act as ambulances. A number of persons had slight bruises and scratches and one woman had a severe double fracture of the ankle. These were rushed to St. Joseph's hospital and those with lesser injuries were cared for in the field hospitals near at hand. The total casualty list, despite exaggerations in the daily press, totaled but seven, whose injuries were more than trivial.

The only fatalities in connection with the meet occurred in accidents to the racing machines. During one of the practice days early in the week Ralph Ireland (Staver-Chicago) was wrecked as he turned out to let another car pass. Ireland died in a hospital a few hours later. On Saturday, while on his 25th lap in the Elgin race, David Buck, driving a Pope-Hartford car,

PEARCE (COLBY) CLOSING UP ON MORRIS (COLE) JUST ABOVE THE GRANDSTAND

ROBERTS (ABBOTT-DETROIT) AVOIDING A SKID

HERR (NATIONAL) AT HORNBECK'S TURN

and Samuel Jacobs, his mechanic, were killed as the result of a burst tire. Jacobs was killed outright and Buck passed away a short time after being taken to the hospital. It is noteworthy that the projected banquet of the Chicago Motor Club to celebrate the meet, on Monday, will not be held, the members of the club attending Buck's funeral instead.

In two other accidents on Friday serious consequences were narrowly averted. John Raimy, driver of a Cino car, and F. E. Radina, his mechanic, had a close shave when their car turned over after a skid on the seventh lap. Raimy escaped with bruises, but Radina suffered a compound fracture of the leg. Fred Robillard collided with a telephone pole when his Staver-Chicago threw a tire at the Hornbeck turn—choosing that alternative to charging into the crowd. Both he and W. G. Reid, his mechanic, were badly shaken up in consequence, though neither was seriously hurt.

The course was guarded by detachments of the Illinois militia, which had been in

camp near Elgin for several weeks, and there were also a couple of hundred special deputy sheriffs, the course being a mile and a half outside the city of Elgin. Good discipline was maintained at all times—even, as already indicated, during the stress of the few moments following the collapse of the grandstand.

The course had been worked for the past three months and was naturally faster than it was a year ago. Then it was simply a country road, widened in a few places, the wrinkles taken out, a bridge being built, the turns fixed up and the surface treated with 50,000 gallons of oil. This year the homestretch was made 54 feet wide for over a mile, the turns were made easier, narrow places were widened and, all in all, it had a much more uniform width, permitting the cars to pass one another without slackening at all and also permitting a few brilliant brushes down the stretch.

It had been generously oiled, but it was slippery as a result of too much oil or not enough sand thereon. But that it was

faster is shown by the increase in the average mileage from 62.5 to 66.4 per hour.

The grandstand was materially larger, with the boxes at the top and covered with canvas. The same cement pits were used, but a 20-inch heavy board guard was placed all along to prevent the possibility of a car skidding into the pits.

The judges' and timers' stands and the press stand were made considerably larger and were more substantially built, accommodating all who made application for seats. In addition there was a guests' stand immediately east of the judges' stand, and this was occupied by invited guests, friends of officials and others.

The score board was on the top of the judges' stand and at six or eight places on the course there were large bulletin boards for the benefit of those who did not seek a position near the grandstand. The reports were telegraphed to these points, so that everybody around the eight-mile circuit had information of the race as it progressed.

How Three Races Were Run and Won on the First Day

Early Friday morning the procession of cars into town began and until the road closed at 10:40 there was a double line of cars and a few horse-driven rigs moving slowly into position along the course. At 10:40 a bomb was shot, which was a

signal to close the course, and inside of five minutes every person was off the road. A few minutes before the time of the start, 11 o'clock, another bomb was fired and again still another as the first car was sent off, so that those away from the grandstand

were kept aware of all that was going on.

As in all merry-go-round races the contestants were started in groups. First, competitors for the Illinois trophy, Herr, in the National leading, were dispatched at half-minute intervals. Followed the Kane

ZENGLE (NATIONAL) IN LEAD OF GRANT (ALCO)

THE ILL-FATED BUCK (POPE-HARTFORD) LEADING GRANT (ALCO)

MERZ (NATIONAL) LEADING ROBBINS (ABBOTT-DETROIT) IN THREE-IN-ONE CONTEST

county contestants, Raimy, Cino, followed by Barnes, Mercer; Maisonville, Corbin; Hughes, Mercer—the ultimate winner—and seven others. Finally the three entrants in the Aurora trophy contest, Robbins, Abbott-Detroit; Kulick, Ford, and Roberts, Abbott-Detroit, were dispatched. But before Monkmeier, whose Staver-Chicago was the last of the Kane county aggregation to leave the tape, had received the word, Herr had finished his first lap, making it in 7 minutes 37 seconds.

For a second time the Illinois trophy fell to the National, this time Donald Herr, for years an employe of the Indianapolis concern which entered the car, being the winner, while his teammate, Charles Merz, was second, only 9 seconds behind him. It was, as before stated, a National race all the way and was devoid of interest except as to which National would prove the winner.

When the two big blue cars had finished, the two Velies were still running, the No. 2, driven by Jeffkins, having completed 20 laps, while the No. 4, driven by Stickney, had covered only 16 laps.

Herr went right out at the start and before the end of the first lap Merz had passed Jeffkins and was hot after his teammate. At the end of the fourth lap Merz had gained 10 seconds on Herr, but having started a minute after had not overhauled him. So far as positions went Merz was then in the lead by a small margin and this he held until he had completed the eighth lap, when he was seven seconds to the better of his teammate. Then Herr began moving up and after the ninth lap had been recorded he was ahead of Merz, having gained 19 seconds in that lap and putting himself ahead by the close margin of 12 seconds. It was a case of near see-saw, but at all times from the ninth up Herr had a slight lead. This lead, counting by laps, was as follows: Tenth, 42 seconds; eleventh, 43; twelfth, 63; thirteenth, 54; fourteenth, 37; fifteenth, 20; sixteenth, 15;

seventeenth, 23; eighteenth, 34; nineteenth, 36; twentieth, 25; twenty-first, 27; twenty-second, 36; twenty-third, 27; twenty-fourth, 9.

Thus neither had much of an advantage, while the consistent running of both cars all through is plainly evident. Merz lagged a little once because he ran past the Hornbeck corner when his brake failed to work soon enough because of grease, and rather than risk taking the turn ran straight down the road, which had been fenced off to take care of just such emergencies. Then he had to back up and get away again, losing the little advantage he had been gaining and keeping him behind the other National, which was humming along at a speed which was rapidly breaking the course record established last year by Mulford in the Lozier, when he did 62.5 miles an hour.

It is noteworthy that the nine seconds Merz lost to Herr in the first lap simply offset the nine seconds difference between the two National stars at the finish, so that

after the end of the first lap the average running time of the two cars was exactly the same.

The Kane county trophy race had the largest field, there being fifteen nominations, but because of the financial troubles of the Fal Motor Co. the Fal cars were scratched and also the No. 26 Cino. This left eleven competing cars, which were sent away after the four Illinois trophy cars had been started at 11 o'clock sharp.

Hughes went right out to win, making the first lap in 7:40, as against 8:05 for the next man, Maisonville, in the Corbin, and 8:07 for Raimy, in the Cino. This gave Hughes the lead and never did he lose the premier position; in fact, he gained a little all along by degrees. But Barnes, his teammate, kept up a steady plug and at the end was only a little over two minutes back of first place.

Raimy's No. 11 Cino went out in the seventh lap, when he skidded and broke a wheel, slightly injuring his mechanic and

ACTION AT THE PIT'S ZENGLE'S FIRST AND ONLY STOP

"GOING, GOING—"

stunning the driver. Ogren had to quit the race in the sixth lap because of a seized piston in the engine of his Colby, but Armstrong's Colby No. 22 was permitted to keep going until the end of the Illinois race, at which time he had covered fourteen laps. It must be said of all the Colbys that they were extremely new, having had practically no work-out and naturally were too stiff to perform well in such a fast race as this proved to be.

Pearce's Colby No. 20 and Jenkins's Cole No. 24 ran a see-saw race for third place, the former gaining the advantage in the first lap and along towards the end, but at no time losing the lead over the Cole entry. Maisonville's Corbin No. 13 and Morris's Cole No. 21 had a similar race all to themselves, while Monckmeier, in the Staver-Chicago, was hot after these two all the time. But he lost many valuable

"GONE!" GRANT (ALCO) FIRST TO START

moments due to a leak in his oil tank and but for this should have been well among the leaders at the finish, as the car ran consistently all the time. Robillard, the driver of the Staver-Chicago entry No. 25, was eliminated in the seventh lap, when he threw a shoe on the Hornbeck turn, went wide and to avoid going into a dense crowd back of a fence, steered straight into a telephone pole, stopping the car, cutting down the pole and putting the car out of the race.

Much had been expected from Frank Kulick in the little Ford, but while the car was fast enough it was so light that Kulick said he dared not let it out. There were but three entries in the Aurora contest, and all started and finished, although the time made last year was not quite equaled. Roberts started out from the word go and just caught Kulick in the first lap. In the

fourth lap he had caught his teammate, Robbins, and from this on it was his race, providing he could dodge mechanical or other trouble and just "keep a going."

Both Roberts's Abbott and Kulick's Ford hummed along without trouble and without stopping, making a steady pace and keeping it up, with Roberts gaining a little all the time. Robbins, who handles the Abbott in Chicago and who never drove a race before, had magneto trouble, the coupling becoming loose and requiring nine minutes to discover where the difficulty lay. Even after it had been fixed, in a few moments, it again gave trouble, and when finally repaired Robbins had lost a lot of valuable time. As it was he was only fifteen minutes behind his teammate at the finish, so that barring the magneto trouble his performance was a remarkably creditable one.

How Zengle Captured a National Trophy with a National Car

Len Zengle captured the western classic, the Elgin National trophy race, not only by brilliant driving but by consistent running of the National Forty, which he drove. But he did not make his win without oppo-

sition, for Grant, in an Alco—and favorite with Mulford for the honors—kept him on the job every minute. Had Zengle been delayed to any great extent he might have lost, but as it was he finished ahead of

Grant by 7.02 miles, being 6 minutes 18 seconds in the lead in the matter of time.

The surprise of the two days of the meet was the splendid showing made in this event by Hughes in the little Mercer, for he not only finished third but was only 11 seconds behind Grant and had been steadily cutting down Grant's lead of 4 minutes 4 seconds in the nineteenth lap.

There were surprises galore in this event, for favorites were bowled over without mercy, and then it became a race between Zengle's National and Grant's Alco, with Hughes's Mercer a possibility, providing something happened to the two big fellows.

Ralph DePalma was the first to be compelled to quit, a broken flywheel—the same trouble that Wishart had experienced in practice—putting him out of the running in the third lap. He had not made phenomenal time in the two laps, however, but he did reel off the second in 7:20, which is almost 70 miles to the hour.

On the same lap Aitken withdrew his National because of a cracked cylinder, which he discovered in the first lap, both laps being slow because of the trouble.

Then Wishart found engine troubles and was compelled to quit because of a broken

HARTMAN'S ALCO IN A MOMENT OF FEVERISH ACTIVITY

THE CROWD ON THE STAND WAITING TO BE THRILLED

connecting rod after he had gone four laps at a pace which, if kept up, would have made him a factor in the race.

Mulford had been going great guns right from the jump, for he knew too well that, being a prime favorite with the crowd, it would be up to the other contestants to go after him above all others. He was feared, too, for some of the drivers openly stated that they would have to go after him in order to make him keep going and thus force him out. That he "went" is shown by the lap times, being from the first 7:27, 7:14, 7:19, 7:17, 7:18, 7:17, 7:13, 7:17, an average of approximately 7:18, or a shade under 70 miles to the hour. But this terrific pace was more than the motor could or did stand, for a connecting rod bearing was burned out and Mulford stopped at the end of the ninth lap.

Three cars, DePalma's Simplex, Mulford's Lozier and Aitkin's National, were shoved to one side of the road at the west end of the pits, and they formed the national colors—red, white and blue—as they were lined up, dead to the race.

The two Cino cars had been scratched, because one was wrecked and an accident had happened to the other in practice, leaving only ten out of the twelve entered to start. The two Simplexes, Aitkin's National and Mulford's Lozier being out,

there were now only six cars left—the three Alcos, Zengle's National, Buck's Pope-Hartford and Hughes's little Mercer.

Hartman's Alco was making a nice showing and drilling along in third and fourth positions until the twenty-first lap, when a bad leak was sprung in the gasoline tank and the car was withdrawn.

The ill-fated Buck had not been a factor from the start because of tire troubles. He was a little slow, making the first lap in 8:53, but he had stated that he intended driving in a conservative fashion and preferred coming home with his neck to winning the race. His second lap was timed at 25 minutes, 53 seconds, and from this time on he lost ground through tire changes. He would come to the pits, take on a new tire and dash away, only to come around for another tire, having made the change on the road and having come in on the rim nearly every time. He was not eliminated, however, until the twenty-fifth lap, and he had expressed his intention of going that one lap and quitting; realizing that he was then seven laps behind the leaders and had no chance for the race. He knew he could not finish because he started on his twenty-fifth lap with his last spare casing. It was literally his last lap, too, for it was on this that a tire burst and sent the car into the ditch, turning over,

righting itself and dashing straight for two militiamen, one of whom was knocked down by the car in its flight.

Buck was in the ditch on the first lap, but was soon on the road after a tire change. He took on new tires in the fourth, fifth and eighth laps, and when he came to the pits at the end of the eighth the casing was wedged between the spring hanger and the wheel, with the tube dragging and the car running on the rim.

The race had narrowed down to Zengle and Grant for the two leading places and Hughes for third. Lee had been having some tire trouble and, while he kept up a good gait, was unable to overcome the delays. He made his first stop at the end of the twelfth lap to change tires, and this, with the change made on the road, set him back some eight minutes. The leaders had finished their thirty-fourth lap when Lee had covered thirty laps, so that he was out of it for anything better than fourth place.

Zengle made but one stop, in the twenty-first lap—177 miles—when he took on 15 gallons of gasoline and filled up his oil tank. Not once did he make a tire change, and after the race an inspection of all four tires showed not even a sign of a scratch or ruffle; in fact, except for discoloration, the tires looked as good as new. Zengle's fastest lap was recorded at 7:17, in the sixth, and his slowest at 8:28, in the twenty-first, when he stopped for fuel. His next slowest lap, while he was running, was the fourth at 7:54. It became apparent to the students in the press stand that Zengle was making just a little better time than Grant, for he was creeping up all the time. Grant made a stop at the end of the thirty-second lap for water, gasoline, oil and a tire change on the left front and right rear wheels. It required 80 seconds to do this work, whereas Zengle's stop required less than half a minute, so systematic was the work of the National crew.

Hughes in the meantime had been humming along at an even gait, doing laps in about 7:45, with an occasional one nearly as slow at nine minutes. His fastest lap was the thirtieth, in 7:34, and his slowest

VIEW SHOWING WRECK OF THE GRANDSTAND

VIEWING RACE FROM WRECKED GRANDSTAND

the nineteenth, 9:58. Hughes had a tire go in the thirteenth lap at parking space 58, but was soon on the road after taking about two minutes to make a change. In the twenty-second lap he took on gasoline and oil and changed a tire. The little Mercer was the admiration of not only the crowd but the officials as well, for all realized that it was doing good work making such a game fight against cars with greater power; all of the other cars to finish had at least $\frac{1}{3}$ greater piston displacement.

Grant was kept posted from the pit as to his position, and while he made a desperate effort to close up the slowly opening gap between his own car and Zengle's blue National, he had to be content with knowing that he was losing a little each round rather than gaining. Zengle simply drove, drove, drove, steadily and with a display of headwork, taking the turns with care lest he should make a false move and lose the race, which he knew was his because of his steady gain and with Grant's apparently hopeless task of holding, much less improving, his position.

The times for the laps show how Zengle gained little by little on his rival:

Lap	28	29	30	31	32	33	34
Zengle	7:41	7:39	7:45	7:34	8:27	7:52	7:46
Grant	7:46	7:42	7:43	7:28	10:17	7:51	7:51

Here, in these seven laps, Grant suffered

SHOWING HOW THE COURSE WAS KEPT CLEAR

a loss to Zengle of two minutes, six seconds—which means a couple of miles or better.

It was of course known the moment Zengle had crossed the tape that he had won, for he had started thirty seconds after Grant and had finished ahead of him. It seemed a long time before Grant hove in sight. The latter had started an even four minutes ahead of Hughes, so that by the time the four minutes were up Hughes was

in sight and until watches had been consulted it was no certainty that the two-time Vanderbilt cup winner had even made the second place secure from the little yellow car; but he had, by the close margin of 11 seconds.

As soon as Hughes had finished the checkered flag went up and the 1911 Elgin road race became history, with Lee's Alco running in fourth position at the end of his thirty-first lap.

Seen and Heard by a Wide-Awake Onlooker at Elgin

Elgin with all its state militia encampments and Grand Army meetings, never saw so many people in two days; the crowd of 1911 was fully twice that of 1910. Every available spot where sleeping accommodations could be secured was gobbled up early on Friday if it had not been taken and occupied a day or two before that.

The city was packed to overflowing because of the races. Private homes of all grades were thrown open to the visitors, the few and very commonplace hotels were jammed to overflowing, and the smaller places nearby, such as St. Charles, Geneva, Carpenterville, Dundee and Algonquin, held many, while a few emulated the Vanderbilt

cup racegoers and slept in their cars around the course. It was also with some difficulty—at least some delay—that meals could be procured. It was too much for sleepy Elgin; it had forgotten last year's rush, and it did not relish it all, even if it did mean that several hundred thousand dollars were dumped into town. It is to Elgin's credit to say that there were not many cases of real extortion, but there was a little raising of prices all along the line. The people of Elgin were tolerant, but the crowd was absolutely the best behaved ever seen at a like gathering. The police had little trouble and there was not a case of disorder that amounted to anything. Elgin a year ago laughed at the prospect of a

crowd and was eaten out; this year immense preparations were made to care for a record-breaking attendance, and still they proved not wholly adequate.

The Chicago & Northwestern road and the Elgin-Aurora electric lines ran special trains and carried thousands from Chicago and the thickly settled neighboring places, such cities as Rockford, Waukegan, Kenosha, Joliet and even Mississippi river places being heavy contributors to the attendance. It is conservatively estimated that there were from 100,000 to 125,000 people around the course on Saturday, while it would be well within the limit to say that from 40,000 to 50,000 people were on hand for the first day's program, the "Three-in-One" contest.

All of Elgin's business houses had closed for the two days and all of Chicago's automobile colony was there the second day. Governor Deneen and a number of prominent state officials, including several military officers, attended the races Friday.

In consequence of this the crowd seemed to have grown to twice the size of the day previous, for many hove into town in the early morning hours and had their positions almost before the ticket-sellers and takers were on the job. After the race it required a full hour for all the people and cars to leave the course, and during that time there were four rows of cars wedging themselves into as little space as possible, but so far as was reported there was not the slightest accident in the final get-away after each day's race. Every mortal man, woman and child had paid an admission and every car had to have at least a \$2 ticket to be permitted to park around the course, and some of them paid as high as \$5. This money goes to the Elgin Road Race Association, and the farmer owners of the land around the course share in it, too.

The race itself was good in some ways, but it was the consensus of opinion that on either day it became decidedly uninteresting because of the lack of real contest. This criticism is not well taken, for there was decided contest; the trouble was that the field was separated and without a close study of the charts showing the positions of the cars by laps it appeared decidedly uninteresting. But the people stayed till the finish, because there was nothing else to do and because those with cars could not get out until the race should be called off.

It was most unfortunate that death should have stepped in and taken Ralph Ireland away the Monday before; it was quite as unfortunate that Buck and his lit-

the mechanic, Jacobs, should have come to such an untimely end just as the former was about to abandon the race because of having used up twenty tires and having no more with which to complete his thirty-six laps. They were imprisoned by the heavy body built up like an enclosed car, making it impossible for the occupants to get out in case of an upset. No sooner had Buck and Jacobs met their fate than the opinion was expressed among the officials that there should be some rule to prevent cars from competing in races when equipped with bodies of this type.

Some consternation is felt in Elgin because of the possibility of damage suits being brought by those who were in the grandstand. The Elgin Automobile Road Race Association, the contractor who furnished seats and stands, the farmers who shared in the receipts from admissions and, just possibly, the Chicago Motor Club, may be dragged into the trouble if there are suits started. That the Elgin association made money this year to offset last year's deficit goes without saying, for the prices of seats and parking spaces had been materially increased and the attendance was perhaps double that of last year.

All told the four races resulted in a signal victory for Michelin tires; the first three cars in all of the longer races were shod with Michelins, as was the Abbott-Detroit, with which Roberts won the Aurora Cup. Kulick, who drove a Ford and was second to Roberts, used Firestones. Splitdorf ignition apparatus, with the exception of the plugs, which were of Bosch manufacture, was the equipment on all three of the National cars with which Zengle won the Elgin trophy and Herr and Merz ran one-two for the Illinois trophy, respectively. Of the other winners and place winners all used Bosch ignition apparatus, with the exception of Pearce, whose Colby was

sparked by a Remy magneto, though he, too, used Bosch plugs, and Kulick, whose Ford was equipped with its own ignition system.

Happily the falling of the grandstand proved less serious a catastrophe than was supposed even by those who remained on the spot and saw that in place of the fifty or more whom the newspapers reported to have been seriously hurt, but seven actually required hospital care. Later reports indicate that of these, but four remained under treatment, three of them being able to

ing. During the 50 minutes that the race was suspended and while the tangled spectators were being rescued from the sunken stand and assisted to positions of greater safety when they could view the remainder of the race, it was reported that there was great activity in the National camp. Zengle's car, later to be piloted home the winner, was said to have suffered a mishap at the outset of the race and to have been in somewhat damaged condition when it was flagged at the end of the second lap. The delay before the race was restarted

a total of twenty-six cars nominated up to Thursday, August 31st. Furthermore, he will invite the Governor of each of the ten States through which the tourists will pass, or near which they will pass, to be his guest from boundary line to boundary line—and it is said that at least some of them will accept. As far as is known this is the first time that a purely sporting event has boasted of gubernatorial interest, and it is hoped that the presence of Governor Smith, at least, will increase the impetus it is expected will

HOMEWARD BOUND—NEARLY 100,000 PEOPLE FORSOOK ELGIN WITHIN FOUR HOURS

go home early in the week. Considering that nearly a thousand people were tossed about when the shoring gave way and permitted the stand to settle to the ground it is nothing short of remarkable that the most serious injury should have been a compound fracture of the leg.

With the relieving of all anxiety as to the outcome of the accident certain rumors of damage suits against the Elgin Automobile Road Racing Association, the contractors and even the Chicago Automobile Club likewise vanished into thin air. Likewise stories to the effect that the Elgin association was trying to avoid some of its obligations, which had been vigorously circulated, also were found to be untrue. The accident probably, however, will not be without useful effect in teaching the management of future gatherings.

Incidentally the falling of the stand gave rise to a supposed situation that is probably unparalleled in the history of road rac-

ing. was said to have been sufficient to enable the trouble, whatever it was, to be set right.

Disappointed partisans of the Alco team made capital of the report after the race was over, claiming that as a result of the delay an unfair advantage had been gained against the field, and that but for that circumstance Grant in the Alco would have finished first, instead of second. The American Locomotive Co., entrant of the three Alco cars, was urged to protest the race on this ground. As a matter of fact, however, no protest has been filed, nor is there direct evidence that the National required, or received, attention of an important nature during the period of idleness.

Ten Governors for the Glidden Tour.

The entry list for the resurrected Glidden tour continues to fill, one of the latest entries to be received being that of Governor Hoke Smith of Georgia, making

be given the good roads movement which is the ostensible purpose of the tour. The Governor will ride in a 36-horsepower Maxwell, which has been tendered to him by the United States Motor Co.

Stock Car Registrations Gaining.

While it is necessary, according to the rules of the American Automobile Association, that stock cars be properly registered at least 30 days prior to the date of stock events in which they are to be entered, it is unlikely that the entry list for the 1911 Glidden tour will suffer on this account, as with but few exceptions all of the prominent manufacturers have registered their 1911 cars, and already eight registrations of 1912 cars have been made. September 14 is the limit date when registration of cars for entry in the Glidden will be entertained, as the tour is scheduled to start from New York on October 14.

VEERAC'S FEATURES DISCLOSED

**Acrostic Name for New Light Truck from
Anoka—Its Engine Controlled by
Novel Method.**

Though its name, which means "Valveless, Explosion Every Revolution, Air-Cooled," tells a good part of the story of the Veerac light delivery car, it does not tell it all, and some of the features which are left untold are at once distinctly novel and meritorious. The vehicle is manufactured by the Veerac Motor Co. at its plant in Anoka, which is a suburb of Minneapolis, Minn.

VALVELESS EXPLOSION EVERY REVOLUTION AIR COOLED DELIVERY CAR

A single chassis nominally rated at 1,000 pounds capacity is produced and on this may be mounted any of a number of styles of body varying to suit the commercial requirements of the purchaser. The price of the complete vehicle with any of the bodies is close to \$850, that figure applying to a full-paneled delivery wagon. Considering the fact that the wheel base of the car is only 82 inches, the length of the available loading platform, which is 88 inches, is rather more than might be expected on a car of this size, this advantage being explained by the location of the power plant under the driver's seat and below the chassis.

As is implied by the phrase from which the name of the vehicle was evolved, the motor is of the two-cycle, air-cooled type. It consists of two horizontally opposed cylinders rated at 20 horsepower and is cooled by means of a fan, the blades of which are mounted on the exterior of the flywheel, which is located in front. By means of deflectors the air is forced to pass directly around the cylinders and this, in

conjunction with especially thin radiating flanges of large surface, effectively precludes the possibility of overheating.

Ensuring economy of operation while standing during short delivery stops the motor is so arranged that one cylinder may be shut off, the saving in fuel thus realized being augmented by the slow running of the motor on the remaining working cylinder. To attain this end suitable levers connected to shut-offs between the crank case and the combustion spaces of each of the cylinders are located on top of the steering wheel. Either or both of the shut-offs thus may be opened or closed at the will of the driver, and it is claimed that for slow running in traffic on high gear one cylinder may be "killed," resulting in a

considerable saving of fuel when running as well as when standing. A foot accelerator connected to the carburetter also is supplied, and this may be used alone or in conjunction with the cylinder cut-offs to provide quicker action and greater flexibility. The simplicity of the two-cycle motor is further increased by the absence of any outside lubricator, the lubricating oil being placed directly in the gasoline. The cylinder walls are lubricated by a continual oily vapor and the oil which drains down into the crank case is sufficient to ensure the proper lubrication of the main and auxiliary bearings.

Two speeds forward and reverse are provided in a planetary change gear set and this and the high-speed clutch form a unit which is supported at three points. Final drive is effected by means of roller chains running over sprockets mounted directly on the spokes of the rear wheels. The wheels are of the artillery type, 36 inches in diameter, and are mounted on roller bearings. Two-inch solid, flat tread rubber tires constitute the standard equipment.

The driver's seat is located at the left side and control is effected by means of a pedal and lever arrangement.

Jackson Announces Three New Models.

Supplementing the comprehensive line of Jackson cars, which are built by the Jackson Automobile Co., Jackson, Mich., three new models have been added. They are styled models 52, 42 and 32, and are rated as 50, 40 and 30 horsepower, respectively. Model 52, which sells for \$1,800, is a roomy, five-passenger touring car of 124-inch wheel base and is mounted on 36-inch wheels. Demountable rims, gas tank, horn and tools are included in the standard equipment without extra cost. Built on practically the same roomy lines, except that the wheel base is six inches shorter, model 42 also is a five-passenger touring car, the price of which is \$1,500. The 34-inch wheels are shod with four-inch tires and the purchase price includes such items of equipment as top, windshield, gas tank, horn and tools. The smallest model lists at \$1,100 and is similar to the others, with the exception that the wheel base is 110 inches and the wheels are 32 inches in diameter; the equipment is practically the same as for model 42. The motors in all of the three new models are of the four-cylinder variety.

White Announces Taxicab Offering.

After a very thorough canvass of the taxicab situation the White Co., of Cleveland, O., is offering a taxicab model embodying features of construction and equipment that particularly adapt it to the service. Instead of the regular pleasure car chassis, a special chassis has been developed. The motor is of the long stroke type, $3\frac{3}{4}$ by $5\frac{1}{2}$ inch bore and stroke, and is identical with that used in the White 1,500-pound motor wagon and in the one and a half and three-ton trucks. The tires are 34 by $4\frac{1}{2}$ on all wheels, which are fitted with quick detachable demountable rims. The panels of the body are metal and are removable separately for replacement in case of damage. Leather is used for the interior finish.

Riverhead Race Plan Abandoned.

After having suffered a postponement on account of conflicting with the date of the Suffolk County Fair, the proposed road race over the Riverhead (L. I.) course scheduled for September 30th has been called off. Although sanction had been obtained from the A. A. A., it is claimed that the promoters were not able to obtain militia to guard the course, which requirement formed one of the clauses in the sanction, and that they therefore decided to abandon the idea. People conversant with the facts, however, are unkind enough to lay the abandonment to the apparent reluctance of the manufacturers to fill out the entry blanks sent to them.

AVOIDING TRUCK TIRE TROUBLES

Overloading and Overspeeding Effects Augmented When Heavy Loads Rest on Wheels—Views of an Expert.

Truck owners and operators frequently are warned about the dangers of overloading and overspeeding their vehicles, but these two forms of abuse are not the only ones to which the tire equipment may be subjected. Another and by no means unimportant one results from allowing trucks to stand fully loaded for hours at a time, or even over night. Because of their apparent solidity and strength some truck operators believe solid tires capable of standing any kind of load placed upon them, a fallacy which should be dispelled if exorbitant tire bills are to be avoided.

In speaking of the abuse of solid tires by otherwise careful drivers and owners, F. F. Phillips, manager of the solid tire department of the United States Tire Co., declares that many truck owners and operators seem to entertain the idea that solid tires need no attention as long as they remain on the wheels and run. "The man who holds these views," he declares, "will find his tire bills far in excess of what they should be. Solid tires constitute one of the most important details of motor truck equipment and, besides, they cost money. For these reasons if a truck owner expects to realize a satisfactory return on his investment he should see to it that his tires are looked after in a business-like manner."

Overloading and speeding are not so much the owner's fault as that of the driver, particularly the speeding, as that is generally done when the truck is out of sight of the "boss." Combining overloading with speeding is the surest way of ruining the best truck made in the shortest possible time. Another effective way of destroying tires is the sudden application of the brakes. This action is extremely hard on the tires, as it is apt to tear the rubber from its base. When the caoutchouc material is wrenched from the base, or even merely split for a short distance, moisture, oil, gasoline are admitted to the crack and result in speedy disintegration of the whole tire. Once a crack is made it is impossible to prevent further loosening.

"In this connection," Phillips remarks, "it may be noted that the most difficult problem confronting solid tire makers has been the devising of means to hold the tire together. It has been comparatively easy, through various processes of compounding, to produce a mileage-yielding tire, but it has not been so easy to maintain the unity of the tire until this service could be gotten out of it. Solid tires show a tendency to peel off the base and violent operation of the brake is a certain aid in this process of disintegration.

"Another practice frequently resorted to, for reasons of apparent expediency, is to allow a truck to stand under full load over night, or perhaps longer. This imposes an unnecessary strain upon the tires and from the standpoint of tire economy it is far better to remove the load from the truck until such time as delivery is to be made. Oil is a natural enemy of rubber and tires should never be allowed to rest on a greasy garage floor.

"Rounding corners at a high rate of speed is a mighty expensive way of demonstrating skilful driving. A driver shortens the life of his tires every time he does it. When a heavy truck is swung rapidly around a corner the strain on the tires is tremendous. They must not only sustain the weight of the load under such conditions, but must resist the swaying motion of the truck as well.

"Street car tracks should be avoided whenever possible, and at crossing points, where there are frogs, additional care should be exercised in dodging them, as the frogs frequently are worn until their sharp edges cut a tire as effectively as though a knife were used.

"It is important that every business man using motor trucks in his delivery system should keep a careful, systematic record of the work done by them and the expense of their operation. In this way, and in this way only, is he in position to know what each detail of his truck equipment is costing him. And if he finds that he is not getting the mileage out of his tires his business judgment tells him he should get he may discover, upon investigation, that the men operating his trucks are more or less at fault."

Raincoats That Are "All-Proof."

On the ground that the ordinary rubberized raincoat suffers by decomposition of the rubber when oil or gasoline comes in contact with it and that the wrinkles cannot be removed by pressing or any other quick method, the Brown & Williams Co., 253 Broadway, New York, manufacturer of raincoats, has brought out a new fabric, known as Ex-Tex All-Proof, which is claimed to be not only waterproof, but gasoline, grease and heat proof as well. The Ex-Tex raincoat can be cleaned with benzine and pressed like a suit of clothes, and is represented as having the appearance of high grade, double texture rubberized raincoats of considerably higher price.

Will Use a Lion for Wireless Work.

During the recent ten days' maneuver of the Michigan National Guard at Port Huron a Lion "40" was used in the wireless telegraph service and performed so satisfactorily that Company A of the Signal Corps decided to equip its wireless section with this car. It is expected that all signal corps in the National Guard sooner or later will equip their wireless telegraph sections with motor cars.

VAGARIES OF FERRY CHARGES

New York Ferries Most Inconsistent in Ferry Rates for Trucks—Some Examples of Gatemen's "Discretion."

Among other conditions affecting mechanical haulage in and about New York City, the Motor Truck Club, a metropolitan organization, which has set itself the task of righting some of the wrongs of motor truckmen, has brought to light certain astonishing inconsistencies in the ferry charges applied to trucks. Instead of basing the tolls on the weight of the truck and its load, a special method of charge proportioned on the length of the vehicle has been introduced. Even this rather incongruous method of classification might be permitted to pass without comment were it not that the gatemen are permitted to use their own discretion in determining to what classification any given vehicle belongs.

Trucks usually are charged ten cents less when light than when fully or partially loaded; otherwise the method of classification by length obtains uniformly. The typical system provides five or six classes, the graduation being two feet per grade and the increase charge for every additional two feet of length being 10 cents. But definite rates do not apply when it comes to paying the ferry gatemen's toll. One prominent truckman stated that on the Staten Island ferry, which is owned and operated by the New York City government, and which is regarded as one of the most inconsistent in the harbor, he has paid from 40 to 65 cents for the same truck and the same amount loaded as light, while with the same truck he was once charged \$1.10 light and 65 cents loaded, according to the whim or vagarious estimate of the attendant.

Another instance is cited with the Forty-second street ferry, where a certain truck should have been charged 25 cents, but the attendants tried to charge 40 cents. Not until the chauffeur left his truck standing in the gangway and proceeded to complain to a superior and compel their measurement of the vehicle did the attendant weaken and accept the 25 cents charge.

The work of the special committee of the Truck club which has the matter in hand has not as yet progressed much beyond the stage of gathering information, but a number of remedial plans are in mind. Pending possible conferences with the various authorities in charge of the ferries and even an appeal to the willing ear of the mayor, it has been suggested that it might be a helpful measure for truck owners to scale their vehicles and have their exact lengths painted on the sides in a position where the figures would come under the eye of the gatemen.

\$250,000 IN A SERVICE BUILDING

Reasons That Impelled Ford to Provide It for the East—Plaintiff Reveals Its Many Purposes.

"With all the talk about 'service buildings' and what has become known as 'service,' in connection with taking care of

place, but they couldn't. The best thing we had offered to us was way over on Tenth or Eleventh avenue, but it was not big enough.

"Then the Pennsylvania Railroad's property over in Long Island City was brought up. It seemed like talking about East Seaboard, Me., or something like that. But we thought better of the proposal after we found that it took hardly any longer to get

avenue on the side and the Pennsylvania railroad tracks at the back. It gave us the room and the location we wanted, so we bought 350 feet frontage, or four times what our building requires, as it is 80 feet wide.

"This extra land is to be kept covered with nice green grass for some time, until it is needed. It will not be needed for quite a few years, because, although the service building has three stories and basement, the foundations, wall construction and pillars are such that it can take seven more stories as they may be required, giving a chance to expand upward considerably before we go sidewise. By spending between \$200,000 and \$250,000, we have provided a real service building that will benefit not only Ford owners in the Metropolitan district, but every dealer and owner in the East.

"For owners in New York City and vicinity, it gives more room and better facilities than our Broadway building, for taking care of adjustments, repairs and replacements, so that they may get their cars back within a few hours under ordinary conditions, and in a minimum of time where rebuilding or coach work is necessary. For dealers and owners out of town, it makes possible a system whereby every replacement part order received before 5 P. M. will be shipped the same day, whether it be for a whole chassis, a body or a switch plug. Orders that come in at night, by telegraph, telephone or special delivery, must be shipped before 10 o'clock the next

FORD SERVICE BUILDING IN LONG ISLAND CITY

customers' cars, only the big fellows are so far really carrying out the idea in a large, practical way," said Gaston Plaintiff, "and I think that about the biggest and best thing that has been done as yet is the new Ford service building in Long Island City, for Ford owners and agents in the East. It's worth seeing."

Plaintiff did not speak as a disinterested observer. He is the manager of the New York branch of the Ford Motor Co., of Detroit, Mich. But he did speak with sincere pride. As the Ford landaulet with himself and his guest from the Motor World glided over the great spans of the Queensboro bridge, on its 15 minute trip from the Ford branch on Broadway to the service building, Plaintiff gave expression to some of the reasons actuating the putting up of the impressive Long Island City structure.

"Broadway rent for a stockroom and repair shop isn't good business," he declared. "In fact, it is hard to find a location on the island of Manhattan where enough space can be obtained without paying outrageous prices for land or rent, and where it is easy for customers to bring their cars and where at the same time the railroad is close at hand for incoming and outgoing freight and express shipments. We had plenty of brokers trying to find such a

MAIN RECEIVING AND DELIVERY ROOM OF THE GROUND FLOOR

there in a machine than it does to go from Columbus Circle down Broadway to Fourteenth street. It is easy to reach by street car, too. The site was 275 feet deep, with Jackson avenue on the front, Honeywell

morning. Express and freight offices are right at hand, while for our incoming shipments from the Detroit factory, we have a spur track from the railroad, coming right to our own platform at the back of the

building, where we can unload four freight cars at a time.

"So important do I regard the service building in the handling of Ford affairs in the East, that I shall make my office there hereafter, instead of at the Broadway branch. The latter will be kept for retail sales, and will carry enough replacement parts and have sufficient repair facilities for minor emergency needs. The display room and headquarters for the wholesale trade,

sponding degree, is to give the owner that 'service' which best assists satisfactory maintenance."

By this time the landaulet had traversed the bridge, passed the handsome building in Long Island City where Brewster automobile bodies are made, and had swung into the wide side-entrance of the Ford service building itself. The accompanying pictures give a suggestion of the spaciousness of the whole building, each floor of

displaying cars. On three sides the room is windows, and it is finished in quartered oak, with elaborate decorative electroliers.

Back of the showroom comes the main receiving and delivery room, where the cars that are to be called for are kept and where incoming cars that are to have work done on them are received. There is a complete checking system for incoming and outgoing cars, something similar to that maintained in the best garages. Near the entrance is a large washing stand, with an overhung swinging hose so arranged that the water automatically shuts off when the hose is not in use. Out in the yard at some little distance is a Bowser underground storage tank, with measuring pump. The tank holds 500 gallons of gasoline. At the rear of the building is a big elevator for taking cars from one floor to another. It is equipped with automatic devices that prevent the elevator platform from being moved unless all gates are closed, and prevent the opening of a gate other than that where the platform is at rest. Outside the building, at the rear, is the spur track of the railroad, with suitable freight receiving platform.

The second floor has the large office at the front; an immense stock room with steel bins and racks full of Ford parts for all past and present models; and the packing and shipping department at the rear. In the stock room there is kept a perpetual inventory of over 5,000 items and group

AMPLE SPACE AND LIGHT CHARACTERIZE THE REPAIR SHOP

however, will be in Long Island City. It is not impossible that we may rent some of the upper floors of our Broadway building to suitable people for offices and lofts, now that we shall not require them for storage and repair purposes.

"Certain moral effects on Ford dealers are expected to follow the erection and maintenance of the service building. The present generous size of the building, the extent of our investment in it, and the provision we have made for increasing it in the future, all go to show our faith in both the immediate and the distant future. Like a certain proportion of automobile dealers in general, some of our dealers have been very wary lest some sudden blight of overproduction or change in conditions might arise between one season and another, and they have been reluctant to make any considerable investment in the business themselves, in the way of headquarters, stocks of repair parts and the like. Our own service building will show our good faith in persuading them to regard the agency for our cars as a proper basis for adequate permanent investment on their part. The fact that we make the very minimum of changes in our agencies from year to year, and do not take an agency away if a man comes anywhere near doing his share of the business, also helps us along this line. The whole object, of course, in urging dealers toward following our example in corre-

A CORNER OF THE STOCK ROOM FOR REPLACEMENTS

which, as indicated, is 80 x 275 feet, with remarkably high ceilings. As the building was only opened this month, the basement, which is to be used for storage purposes, was simply a great, barren vastness of concrete floor, with a boiler room and coal bunkers walled off in one corner. It looked big enough to hold several hundred cars. The main or ground floor has the showroom in front, for receiving visitors and

units of parts for Ford cars, with a system that gives ample notice when any particular item is getting low.

Practically all work on cars is done on the third floor, where the repair shop and assembly floor is located. The necessity for pits is avoided by short movable inclined runways that elevate either end of a car and permit a workman to get underneath. The room for tools and supplies,

with a check system, is on this floor, as is the machine shop, which is fitted with lathes, testing stands and other necessary equipment. The varnishing and finishing room for bodies is in front, with dustproof compartments where the painting and varnishing jobs may dry to best advantage. Sanitary drinking fountains, metal cans for waste and plenty of "No Smoking" signs form an obligato to the general equipment throughout the building, which also has a private branch exchange telephone system and a special fireproof and burglary-discouraging vault.

Like the showroom, the office is a solarium, with daylight flooding it from three directions. Plaintiff has selected the sunniest corner as the location for his large,

WHAT ONE GIFT MOTOR CAR DID

**It Made the Amir of Afghanistan Boom
Automobiles and Order Good Roads
—The Effects.**

Owing to the peculiar conditions existing in Afghanistan the automobile presently is to enjoy the distinction of becoming the sole means of modern transportation in use. After years of semi-barbarism the Amir has become a motorist. Consequently, as the indulgence of the pastime requires good roads, the decree has gone forth that good roads shall be built forthwith, while to give permanent impetus to

the highest mountainous region in the world.

Mexico's Market for American Cars.

Supplementing his previous report as to the good market offered by Mexico to American automobile manufacturers, United States Consul William W. Canada, stationed at Vera Cruz, calls attention to the number of automobiles imported from Europe during 1910, all of which arrived at the port of Vera Cruz and were reshipped to Mexico City, the capital. The cars imported from the different countries were as follows: From Germany, 151; England, 8; France, 11; Spain, 1; United States, 38. Germany is credited with 151, but the major part of these machines came from France and were credited to Germany because they came in German vessels.

"Great care should be taken by shippers when packing for export," says the Consul. "Automobiles imported from Europe are completely boxed up, whereas some American machines are sent to Mexico in crates covered with paper. In one instance brought to the attention of this Consulate the paper was torn and a watch had to be put upon the crate to prevent the theft of detachable fixtures."

Mitchell Cars to Be Remy Lighted.

As the culmination of a series of exhaustive tests, the Mitchell-Lewis Motor Co., Racine, Wis., will equip the higher priced Mitchell cars for 1912 with the Remy magneto light. The system, it will be remembered, is one in which a special Remy magneto is used for both ignition and lighting, a winding around the magneto serving to cause the generation of additional current, which is collected by a set of brushes and stored in a battery or used to light the lamps directly according to the condition of the battery. When the engine is at rest the battery automatically takes up the lighting load. When the battery is fully charged, and the engine is running, an arrangement of automatic switches diverts the current directly to the lights. The battery therefore is maintained in a fully charged condition.

Show Question Splits Spokane Dealers.

Spokane automobile dealers are in the midst of a "merry war" and the prospects are that the residents of the Eastern metropolis of Washington will have two automobile shows during the Inter-State Fair this fall. The Spokane Automobile Association has contracted for all the space in the automobile hall at the fair grounds, thereby cutting out dealers who are not members, the fair management having ruled that no automobile exhibits will be permitted except in the hall assigned for that purpose. The anti-association dealers threaten to rent a separate hall for the week and in addition to organizing a rival exhibition give daily automobile parades.

HOW THE REPAIR PIT HAS BEEN SUPPLANTED

flat-top desk, as he finds it a happy contrast to being stowed away in the nocturnal recesses in the middle of a Broadway building closely crowded by neighboring structures. At first he thought of dividing its 80 feet of width and generous depth into partitioned-off rooms for the various divisions of the office force, but when it came to the pinch he did not have the heart to do it. Scientific arrangement of the desks, telephone exchange and other office appurtenances will be employed.

"Vapor Cooling" in Ohio Falls Car.

Embodying the rather unusual engine which at one time was incorporated in the Jonz car, the first 40 horsepower, five passenger machine of the American Automobile Co., of Ohio Falls, Ind., has been completed and is being exhibited. The engine is two-cycle, waterless, valveless and "vapor cooled." The "vapor cooling" is effected by making the compressed crank case mixture sweep certain radiating surfaces on the under side of the pistons. The company is occupying the former New Albany woolen mills.

the movement a motor vehicle service is to be introduced over a 200-mile route across the northwestern frontier. For this purpose it is said that the Amir has placed an order for rolling stock to the tune of over five lakhs of rupees, or \$162,000 and upwards, with P. Stewart, of the Bombay Motor Co., Bombay.

The impending revolution in transportation is the direct outcome of a piece of subtlety on the part of the Government of India in presenting a fine car to the Amir when he last visited India. Before the time of his return the Amir was so enthused with motoring that he decided not to abandon his new possession, but to provide means for its successful use at home. Hence the projected highway improvement, which has caused the potentate no particular mental or financial strain, since it was necessary merely to order the construction of the roads radiating from his capital at Kabul by forced labor.

The new motor line will run from Peshawar, which is in British territory, to Kabul. Its route lies through the celebrated Khyber Pass in the Pamir plateau.

ABBOTT-DETROIT CROSSES DESERT ON CANVAS STRIPS

KELSEY MOTORETTE ON ALABAMA "ROAD"

DUPONT'S UNIQUE CAMPING CAR

Delaware Senator Has Special Vehicle From Which He Will Oversee Road Work—Its Ingenious Appointments.

Having decided to build a broad highway across his native state with his own money and under his own supervision, Col. T. Coleman Dupont, United States Senator from Delaware, does not permit any "grass to grow" under his feet, and goes about the carrying out of his project in a systematic and detailed manner. Realizing that if he wishes to supervise the construction of the road he will have to live in the open air for considerable periods, and desiring to be as comfortable during these periods as modern ingenuity can make him, the senator has purchased a specially designed touring car with as unique an arrangement of "home comforts" as could be obtained.

The car is a Stoddard-Dayton 45 horsepower chassis, with the regulation 115-inch wheelbase. But instead of carrying a five-seated touring body, it is furnished with a long body, which is illustrated elsewhere, so laid out that it furnishes enough space to accommodate a six-foot hair mattress. On each side of the body are lockers, six inches wide, running the entire length of the car, and affording packing space for supplies. Above the body is a permanent top with a slat rack on the under side holding four vulcanized fiber provision boxes, and another special rack for the temporary filing of drawings, maps, etc. On the outside of the top, in a rack with iron railing, are four spare tires.

The lockers contain all manner of apparatus, such as a portable cooking stove and kettles, pots and pans; a storage battery and dry cells; tent material, and a very complete tool outfit; oil reserve tanks and other supplies. The tent is notable, as it is constructed of balloon silk, water-proofed and capable of being compressed into a very small space. Six poles, each six feet high, are carried on the running board alongside of the car. The curtains are so arranged as to form three compartments, two outside of the car body and one car compartment inside.

Another interesting feature of the equipment is the electric light plant. It consists of one Edison 150 ampere hour storage battery, charged constantly by means of a dynamo driven by the flywheel of the engine. The storage boxes fixed inside the car may be removed when stops are made and may be easily carried out into the camp. They are upholstered on top and serve as seats while camping. They contain blankets, sheet iron trays, etc.

The road which Senator Dupont is making preparations to build is to be from 100 to 200 feet wide, running for a distance of 103 miles in a north-south direction

across the state. Although it has been variously announced that this road is a present from the senator to his native state, it appears from earlier interviews given by him that he probably will recoup himself for the \$1,500,000 which it is said it is going to cost, by collecting a toll from automobiles and other vehicles using it. Evidently Senator Dupont is determined that this road shall be built properly, without the deplorable "shoddy" work so often met with in the construction of roads built with the money of the taxpayers. He is going to see that it is "built right."

Highway Advertising is Unlawful.

Friday, September 1st, marks the terminating of the free advertising privilege within the highway boundaries of New York State. Accordingly motorists in many sections of the State are planning to go forth on grand campaigns of pillage and destruction on that day, removing the many signboards and placards which deface fences, trees and guide boards in the country districts. The movement has the sanction of the State government, being in line with the enforcement of a law passed by the last Legislature, which reads in part as follows:

"A person who * * * in any manner paints, puts or affixes any business or commercial advertisement * * * on or to any stone, tree, fence, stump, pole, mile board, mile stone, danger sign, danger signal, guide post, billboard, building or other structure within the limits of a public highway is guilty of a misdemeanor. An advertisement in or upon a public highway in violation of the provisions of this subdivision may be taken down, removed or destroyed by anyone."

The Good Roads Committee of the American Automobile Association has requested the fifty odd automobile clubs in the State to make an effort to clear the horizon of these obstructions as quickly as possible. The only signs that cannot be touched are those in the forest district of the State that have been put up by the State Conservation Committee. They are cloth notices in regard to forest fires.

New Connecticut Bridge Is Opened.

Motorists of Connecticut and adjoining States commemorated Thursday, 24th inst., the opening of the new million dollar bridge over the Connecticut River, between Saybrook and Lyme. Over 500 motorists took part in the parade, which officially marked the opening, and nearly as many more crossed in order to be among those who visited it during the first free day, for it is to be a toll bridge. Addresses were made by Lieutenant Governor D. A. Blakeslee, Col. James N. Shepard and Mr. James H. Day, the Bridge Commission. Senator Stiles Judson and Rev. Frederick Sexton. The toll charges are: Touring car with driver, 53 cents, runabout with driver 38 cents and motorcycles 15 cents.

PUTTING IT UP TO THE OWNERS

New York Garageman Charges Majority of Motorists With Being Unreasonable—How They Keep Agreements.

If they could see themselves through the eyes of the garagemen, it would take some of the pride out of a good many motorists—not alone in those instances where the garageman regards his customers as mean and overly exacting but also where he regards them as exceedingly foolish in the way they manage affairs relating to their cars. Into a sympathetic ear the manager of a large uptown New York garage released some of his observations as follows:

"It's a pleasure to serve some customers. They pay their bills on presentation, after auditing them carefully, and they always keep the garage properly advised as to when they want their cars, so that their machines are always ready for them at the right time in spick and span order. But like everybody else in the world, the garageman has his troubles, and they are not confined to chauffeurs and help. Some of the customers are worse than any chauffeurs or disloyal employees.

"In the first place, many owners when seeking storage for their automobiles wrangle over the terms. There is nothing criminal in that, but it ought to be generally known that the rates at good garages are pretty well established and that beyond a certain point it is a waste of breath to hold out for special inside prices lower than anybody else gets. With most of these Marathon wranglers, however, it is the case that they would not come to your garage were it not for the fact that it is near their homes. They will not keep a car at a distant point, even though they employ a chauffeur. The gasoline and the time consumed in going to and from the garage is an important item to them. Many of them offer terms that would be a considerable actual financial loss to the garage.

"It is much cheaper to store a car in the suburbs than in the congested part of a city, but quite aside from this most owners want their cars kept near their residences. If the owner does not employ a chauffeur, he prefers that the walk to the garage be short, and if he does have his own driver, he can find out without much delay what is preventing his man from keeping an appointment.

"With these suburban owners the usual request or demand for a cut in rates is based on the representation that the car will not be used very much and that therefore it will not be necessary to wash the machine and polish the brass more than once a week. This would hold good, perhaps, were the car taken from the garage only once a week, but the garageman does

not care much about having machines that are on almost dead storage. It is the cars that are used that are counted upon for profits in the business. They consume gasoline and oil, which help put money in the cash drawer.

"Should the customer be accommodated with a slightly lower price because of the fact that his car is to be used so little, he nevertheless will kick like a steer the first time his car is brought to the house unwashed, after it has been washed three or four days in succession. When reminded of his special arrangement, he generally has forgotten that any such things were said, with the result that the garageman who cannot show a written and signed contract covering the case is in a bad situation. In some cases he yields in order to prevent a neighborhood row.

"Tough customers are found among the men who drive their own cars. Some of them have the trick of getting the garage down to the lowest possible rate and then offering one of the employees extra money to pay particular attention to their particular cars. We have such a man here. He drives a runabout, for which our regular charge is \$25 a month storage. This man lives nearby and generally goes out each evening and on Sunday. He did not want the car washed or polished more than once a week, and declined to pay more than \$20 a month storage.

"He was the first one to make me a special proposition like that. Thinking that he was in a position to send the garage a lot of transient business I agreed to his terms. He had hardly concluded talking with me before he slipped around to one of the employees and had offered him \$2 a week to look after the car, polish the brass, etc., every day. This employe belongs to the day force, and in order to do the work would have to neglect his own work, as all the polishing is done at night. Consequently he gets one of the night polishers to do it.

"Figure it out and you will see that this owner is paying from \$28 to \$30 a month for service that he could have gotten for \$25 a month. Furthermore, he is not getting as good service. All the employees in a garage get to know the owner who has insisted on a cut rate, and no matter whether that man pays out extra money to one of the men to look after his car, he does not get good service. For my part, he receives exactly what is contracted for, and the employees carry out the contract to the letter. They have no use for the cut-rate customer, despite the fact that one of them may be receiving tips from him. Tips, as a rule, are divided, but where one man is picked out individually he retains what is given him. The usual tips in the garage are from transients or tourists, as they realize that their unheralded arrival and the quick work that is necessary to take cars of their traveling needs rather disturbs the regular routine. Tips are not

looked for, I am happy to say, but in such cases are generally given.

"Many misunderstandings arise with the owner who has purchased a second-hand car, which has been overhauled and repainted before entering regular service. He seldom wrangles over terms, but he is a kicker of the first water about what happens to the finish of his car, and blames it on the garage when it gets dull and shabby all too quickly. A repainted car will not hold its finish like a car fresh from the maker, and it does not take many washings to dull the finish.

"On repainted cars we do not permit the washers to use soap of any kind, and we make the finish last as long as it will. In addition to the complaints about dull finish, there will be kicks about stains that find their way to the body surface. It does not make any difference whether the stain was acquired outside the garage or not, the garage is blamed. In all good garages, when a stain, scratch or dent is noticed, the washer reports to the foreman and then to the manager. Frequently the marks are only hand marks or finger prints, often made by the owner, and which stand out especially conspicuous on refinished cars.

"Quite as many owners cannot hold a chauffeur for any length of time as there are chauffeurs who cannot hold a job. I know an owner with two cars, who had eight chauffeurs in seven weeks. Then I secured for him a man whom I consider a high class chauffeur in every respect and who thoroughly understands every phase of the business. He would not have taken the position except that at the time his former employer had released him for the winter and he had a family to support. A very moderate salary was agreed on, with the promise of \$5 per week bonus additional provided the chauffeur held the position for six months.

"That chauffeur fulfilled his part of the contract in every particular, although the employer had no thought for the man's comfort. The owner would frequently send the car out in extremely bad weather for no other purpose than to take the 15 year old son to a confectioner's shop. The automobile would have to be taken from the garage to the hotel, make the trip for candy, return the boy to the hotel and then go back to the garage, covering perhaps a mile or two, when it would have been easier and more healthful for the boy to have walked the two blocks for his candy.

"The two cars of this owner were not supposed to be on live storage at all times, one being dead storage excepting on Sundays, when it was used, and the other or 'small car,' as it was called, not to go out on Sundays. For this a special concession had been made at the garage. It was not long, however, before the man and his wife would use both cars daily, and when the bill for extra service was presented there was a howl. This man did not keep faith with the chauffeur concerning the \$5 per

week extra that the latter was to receive for six months' service. In exactly five and a half months he decided to put up the cars for the summer and go to Europe. The chauffeur had to seek another job without having his expected \$130 for a rainy day. That is one type of owner.

"Another type is the man whose wife has the purse strings and pays the bills. He is the old maid of the fraternity and he is constantly 'phoning about one thing or the other that 'the wife' wants. I would rather deal direct with the woman than the husband. We have a number of cars here owned by women who have chauffeurs. These ladies transact their affairs in a business-like way and their complaints are very infrequent. They are as particular as anyone could be and want the best of service. They get it. The man whose wife pays the bills endeavors to make the garageman believe that 'Madame' is a crank, when it is the other way around. He is the crank, and when arranging to store the car or cars, drives a close bargain by insisting that this or that little detail need not be bothered about. Then just as soon as things begin to run smoothly he rings in complaints from the wife. He uses this method to get more than called for in the original agreement. Such men generally permit the bills to remain unpaid until threatened with suit. They are afraid to give them to 'the wife.' I have come across several such men during my experience; then have happened by accident to meet 'the wife' in a business way and found that things as represented by the man were quite at variance with the facts.

"The main thing an automobile owner should do after acquiring a car is to secure the service of a competent chauffeur. I do not mean a graduate from one of the so-called automobile schools, but a man who has had experience and can give the best of references from other automobile owners and people connected with the industry. Look him up as you would an employe in any other line of business, not only as to his ability to drive a car, but as to his knowledge of the motor, etc. Then give him absolute charge. Since the owner trusts the chauffeur with the care and lives of the members of his family while out driving, he should not hesitate in giving him charge of the automobile. Then the owner should never permit the younger members of the family to call for the car at will, and should let instructions be given only by himself or wife. The car then will be well handled and the owner will receive good service on the part of everyone. I know a number of chauffeurs working under these conditions, and I do not think they could be induced to leave their present employers. Others, however, could easily be 'stolen,' provided the new employer sought them out. I do not mean the kind that would demand fancy wages but those who only desire to receive all that is just for the service required."

Standardizing the Control Lever System

It is an undisputed fact that a large percentage of automobile owners knows little, and cares less, about the structural details of their cars—until some derangement of the mechanism becomes apparent. Then enlightenment, of a kind, comes with a rush. A nut or a bolt is lost on the road and the car is stopped at some wayside repair shop. Possibly and quite probably the village smithy is appealed to, and if by any chance he can replace the lost part with another that fits, the motorist goes on his way rejoicing.

If he cannot supply the proper size bolt

long by one-half or one-quarter. But the owner was not the only one to appreciate the advantages of standardization. Its possibilities long have been appreciated by manufacturers as well, though little in this direction was accomplished until comparatively recently. What has been accomplished resulted primarily from the efforts of the mechanical branch of the now defunct Association of Licensed Automobile Manufacturers, the foundation work of which is now being utilized by the active Society of Automobile Engineers. At the last meeting of that body, a large number

that they master the differences of movements necessary.

Such an arrangement would possess many advantages, but there are any number of reasons why it scarcely is possible. This matter of standardization of control levers received attention at the last meeting of the S. A. E., with the result that three "standard" forms of segment, or gate, for selectively operated change gears, as shown in Fig. 1, were recommended for adoption by manufacturers. As may be seen, in each of the three, the starting position is on the inside and to the rear, the reason for this being that with four speed changes the second most frequently is used for starting, the lowest being reserved for hill climbing. The uniformity of movement for both three and four speed changes is further carried out by providing that the next higher change in each is obtained by an outward and forward shift, final drive in each case being obtained by a straight pull back. Likewise, in each case, the reverse is obtained by a forward movement in the innermost slot.

Though the system suggested has the merit of uniformity, and it is not unlikely that it will come into more general use, there are several reasons, chiefly mechanical, why its general introduction may be a matter of several years. The principal reason is that there scarcely are two makes of cars which are built sufficiently alike to render an immediate change practicable, did the makers desire to adopt the new standards. Though at first glance it might seem that the adoption of such standards would necessitate only minor alterations, a study of the accompanying illustrations will show that while the necessary alterations readily may be made in some instances, in others they require more extensive changes, and hence, are not likely to go into effect save in entirely new models.

In the arrangement of the Winton control mechanism, shown in Fig. 2, is depicted a favorite method among a large number of manufacturers of enclosing the rod, A, by means of which the emergency brake is applied, inside a sleeve, B, to which the gear shifting arms are attached. The selective action in this case, by means of which four forward speeds and one reverse are obtained, is made directly in the gear box, an extension of which encloses the shifting arms.

The Kissel mechanism, which is shown in Fig. 3, while similar in that the same telescopic arrangement of the rod, A, which actuates the emergency brake, and

FIG. 1—PROPOSED STANDARD GATE FOR SELECTIVE CHANGE GEARS

or nut, and though repair shops, both orthodox automobile repair stations and those which glean most of their business from owners of horse-drawn vehicles, generally are well stocked with a miscellaneous assortment of such accessories, not infrequently a nut or a bolt that will fit cannot be found, the most natural question in the world is, "Why?" "Why should automobiles be bolted together with bolts of special sizes—sizes that seldom are encountered in other branches of mechanical endeavor?"

Then the owner commences to learn. He learns that a nut with 20 threads to the inch cannot be used. He must have a nut with 21 threads, or 19, or 23, or some other number. That 20 threads to the inch for a bolt of that particular diameter has been standard for years among carriage builders and practically everywhere else where bolts and nuts are used makes no difference. When he built the automobile, the manufacturer evolved a new size—for reasons best known to himself—and the owner, figuratively, is "up a tree."

Of average intelligence, probably the next impression which the owner receives is that if, when his car had been built, there had been some system whereby only standard sizes of nuts and bolts had been used, he would not have been delayed as

of standards were adopted. Among them was the adoption of a modified standard for nut and bolt sizes. It follows that after the general introduction of these standards an owner may be much more certain of obtaining the size of nut or bolt he wants because only standard sizes will be used and the dealer or repair man will know what sizes to stock. Eventually it is hoped that as far as is practicable all parts of the automobile will be made in conformity with certain standards which may be agreed upon by a majority of the manufacturers. It readily may be seen that such a system would work advantageously to both purchaser and manufacturer—to the purchaser in that repairs and replacements would be facilitated, and to the manufacturer in that first cost would be reduced because of the possibility of using stock parts at decreased cost; the use of special parts always entailing extra expense.

Following out the general idea of standardization, persons of purely lay minds are not unlikely to ask why if some parts are standardized others are not. And that part of the mechanism which is suggested most often as particularly adaptable to standardization is the control levers. Why should not control levers, at least, be standardized so that Tom, Dick or Harry could run each other's car without it first being necessary

the sleeve, B, by means of which the three speeds forward and reverse are obtained, is quite different as regards the manner in which the selection is secured. Instead of being made in the case as in the other, it is made outside, the selector forks being placed at the front of the gear case. Another variation which may be noted is that the emergency brake rod is carried clear across the chassis with a bearing in the center to insure rigidity.

Two separate rods for gear shifting and emergency brake, respectively, are used on Corbin cars, the arrangement being shown in Fig. 4. In this arrangement also, the gear shifting rod, A, enters the gear case, the selective operation being made directly in the case. Three speeds forward and reverse are provided. With this arrangement

FIG. 2 WINTON SELECTIVE GATE CHANGE

of the emergency brake lever, the point of bearing, B, of the rod by which the brakes are actuated being further removed from the handle of the lever, slightly greater leverage is obtained.

In Fig. 5 there is illustrated another method of arranging the gear shift and emergency brake rods separately, though in this case they are placed side by side instead of one over the other. Obviously, the rod, A, actuates the gear shifting mechanism, and as in some of the others, the selective operation is made in the gear case, the rod entering through an extended housing on top of the case. Incidentally, the picture illustrates a clever method of providing for the adjustment of the brakes. The turnbuckle which is used for this purpose is locked by means of the "latch," which when fastened fits over the partly flattened rod and effectively prevents the adjustment being deranged by vibration. Its chief advantage is that it can be adjusted without the use of a wrench.

While in all of the control mechanisms which have been described the selective operation is made either in the gear case or at it in the Speedwell arrangement,

shown in Fig. 6, the selection is made at the segment or quadrant. The telescopic arrangement is carried even further in this instance, there being two sleeves, by means of which the gear changes are obtained,

FIG. 3- DETAILS OF KISSEL CONTROL

and these enclose the rocker shaft, D, which actuates the emergency brake through the rod, E. The outer of the two sleeves, A, is attached to the shifter arm, B, and the inner sleeve is connected to the other shifter arm, C. The sleeve, A, carries a forked arm at its outer end so that when the hand lever is moved toward the body of the car it engages with the notches, permitting the rotation of the sleeve and

FIG. 4-CORBIN LEVER ARRANGEMENT

the consequent movement of the gear shifting arm. Similarly, the inner sleeve is arranged with an arm at its outer end which engages with the hand lever when it is moved outward, the shifter arm, B, thereby being actuated.

Indicative of the tendency toward unit construction, and also illustrative of one

of the more recent engineering accomplishments, the Columbia-Knight change gear mechanism, which is shown in Fig. 7, portrays graphically the element of simplicity which is possible with center control. The levers in this case are at the right of the driver, the car being of the left hand drive variety; four forward and one reverse speeds are provided. Not the least of the advantages of the center control is the elimination of parts which is possible. Cross rods are unnecessary, and other things being equal their elimination should make for greater ease of operation because of the decrease in friction. In addition to this advantage a greater proportion of the mechanism is fully housed and therefore less liable to injury. The arrangement il-

FIG. 5-SEPARATE CROSS SHAFT MOUNTING

lustrated also permits the manufacturers to offer an option on right and left hand steering without undue inconvenience or expense.

Gear shift and emergency brake levers, however, are not the only elements of the control mechanism which are susceptible of more or less standardization; it has been suggested on more than one occasion that the spark and throttle levers might also be so arranged as to provide some similarity in different makes of cars. Which is to say that of two cars in which both levers are placed on top of the steering wheel, as in the Knox wheel shown in Fig. 8, the throttle lever in each case might be definitely agreed on as the outside one or vice versa, though when so arranged the outside one logically should control the throttle opening because of its position nearer to the operator's fingers.

Often, too, these two levers are mounted on semi-circular quadrants side by side, the throttle lever in some instances being on the right hand quadrant and as often being on the other. Such changes as would make either one or the other of the levers always the throttle lever, in all makes of

cars in which that or a similar system was used, could, in the majority of cases, be made quite easily, and the liability to accident would be decreased. Naturally, the careful driver raises the hood of a strange car to determine "which is which"

FIG. 6—SPEEDWELL GEAR SHIFT SYSTEM

before he attempts to drive, but if the positions of these little, but none the less important, levers were standardized, such measures would not be necessary.

Even where the levers are placed under the wheel on the steering column, as in the wheel which is illustrated in Fig 9, some system of "hook up" might be employed to advantage and it would entail little, if any, extra expense. For instance, of the two levers in Fig. 9, the lower one is the throttle, though owing to the proximity of the other to the wheel, more easily within reach of the driver's fingers, it might be

FIG. 8—KNOX ENGINE CONTROLS

supposed that the reverse was the case. In other makes of cars in which similar arrangements are used, the throttle lever is placed above the spark lever, and a driver going from one car to another scarcely could fail to be confused.

Owing to the increase in the use of the fixed spark, a number of cars now are being put out with but a single lever at or near the steering wheel, and this simpli-

fies matters considerably. Obviously that lever controls the size of the throttle opening. There are any number of ways in which this lever may be mounted, and as it is the only one to which the driver has to pay attention, its actual position makes little difference, provided, of course, that it is easily accessible. One of the comparatively recent developments in this respect is the S. G. V. arrangement which is shown in Fig. 10. It is nothing more than a small knurled knob mounted on one of the spokes of the steering wheel; by means of small bevel gears and suitably placed rods the throttle is controlled by the turning of the knob. In this and many other instances the driver's main dependence is placed in the employment of the foot accelerator.

Just how far standardization of control mechanism eventually will be carried is difficult to forecast. Certain it is, however, that today elements are much more standard (or more properly, similar) than they were in the early days of the automobile, and it seems within reason to expect that

FIG. 9—ANOTHER CONTROL SYSTEM

with the further growth and development of the industry, standardization will be carried to greater lengths. Those motorists who are wont to rail at what they style "inconsistency" of design should remember that the development of the automobile has been none the less steady for its apparent lack of convergence to standard forms, and that inasmuch as standardization requires some little redesigning in many cases, that also may be slow of accomplishment, though it is hoped it will be no less sure.

To Make Gear Shifting Easier.

In those cars in which the construction of the gear shifting mechanism embraces a tube to which the gear shifting lever is attached and which slides over the rod by means of which the emergency brake is actuated, it is well occasionally to grease the rod where it is exposed to the atmosphere. Owing to the continual rush of air oil is of little or no use as it evaporates rapidly and not infrequently the rod becomes dry and causes trouble in gear shifting. A small quantity of grease will effect a cure where a large quantity of oil would

be effective for but a short time at the least.

Why Exhaust Pipes May Become Clogged.

Though clogged mufflers on more than one occasion have been accused of causing an unnatural falling of power, it should be

FIG. 7—COLUMBIA CENTER CONTROL

remembered that as often as not the real trouble lies in the obstruction of the exhaust pipe itself, where it joins the muffler; the area of the pipe may be considerably restricted at this point by an accumulation of burnt oil. This trouble is particularly prevalent in those engines which show a tendency to smoke. The burnt oil issuing from the engine is, of course, deposited within the whole length of the exhaust manifold and pipe, but the interior of the former and that part of the pipe which is near the engine is kept compara-

FIG. 10—SIMPLICITY OF S. G. V. THROTTLE

tively clean by the flame which issues from the exhaust ports of the motor. As the exhaust gases pass along the pipe, however, they are rapidly cooled as the flame extends but a small part of the length of the pipe so that the deposit near the outer end is not burned away as it is at the other end. Consequently any deposit which forms remains and rapidly accumulates.

GERMAN SUBSIDY STANDARDIZED

How Government Controls Use of Motor Trucks—Cannot Sell Without Permission—Quarterly Reports Required.

Following the various tentative arrangements with manufacturers and purchasers of motor trucks, in regard to the utilization of the latter in actual war or in mobilization trials, the Imperial German Government finally has decided upon a full set of regulations, rules and contracts applicable to all who desire to take advantage of the government subsidy offered. These regulations, which in fragmentary form have been followed for some time in the individual sovereign states composing the Empire, now are effective throughout Germany, and consist chiefly of the following requirements:

A subsidy is granted to the purchaser of a motor truck or "road train," providing the said purchaser keeps the vehicle in good condition and at all times at the command of the government, ready for road duty in either maneuver or actual war at a moment's notice. Such a road train, in order to fulfil the requirements of the war department, must consist of one motor truck and one trailer, the former carrying a useful load of at least 8,800 pounds and the latter one of at least 4,400 pounds. The dead weight of such a complete road train, inclusive of driver, helper, full gasoline tanks and all tools and winches, must not exceed 19,800 pounds. The motor must be geared to the driving wheels in such a manner that a speed of 10 miles an hour on level roads cannot be surpassed. Ordinarily the road train is required to make eight miles an hour on ordinary, level roads. The train must be capable of climbing grades up to 14 per cent., fully loaded and with loaded trailer; it must be built so as to support the addition of another trailer in emergency cases, and must still be capable of making 10 miles an hour when occasion calls for such a speed.

The subsidy granted consists of the sum of \$1,000 paid by the government at the time of purchase and four annual payments of \$250 each, payable at the end of the second, third, fourth and fifth year of usage; amounting, therefore, to a total of \$2,000 for each road train. Special awards may be added to these amounts, if the company or individual using the road train makes valuable improvements tending to increase the usefulness of the vehicle, or succeeds in developing a particularly efficient operating organization, whose abilities might prove of value to the government in war time.

In granting this subsidy the government requires the careful handling of the train during the five years allowed as the term of its useful life; it requires that each vehi-

cle be fully insured against fire and accident; that a sale of such subsidized vehicle is only permitted within the confines of the Empire, provided the special permission of the minister of war is obtained: a sale to any citizen of another country, or the removal of such a subsidized truck across the German frontier is strictly forbidden. The owner of the road train furthermore is required to submit every three months a complete tabulated record of the work done by the train, and to permit the government's agents to examine the condition of the train at any and all times. Should he fail to fulfil these conditions a fine of \$125 is to be imposed for every failure. The owner must, furthermore, send his vehicles twice a year on a reliability tour under the supervision of the government, and in case his trains do not measure up to requirements his annual subsidy is immediately canceled.

Ramblers 96 Per Cent. Kenosha Made.

Since the recent completion of extensions to the plant of the Thomas B. Jeffery Co., Kenosha, Wis., 96 per cent. of all the parts which go to make up Rambler cars now are made in the company's factories. As indicative of the care and supervision which the production of such parts under its own roofs permits, it is stated that during 1910 and 1911 the average value per car of parts sold for the 20,600 Ramblers in use was \$14.58. This figure, however, covers the total number of parts purchased by all owners of Ramblers of every age varying from ten years down to two years.

Motor 'Buses to Replace Trolley Cars.

Delaware has a new motor 'bus line. It is operated between New Castle and Delaware City, and replaces the trolley cars between those points. Until August 1 the railway was leased by the Wilmington Southern Traction Co., which owns the line between Wilmington and New Castle, but because of a dispute between the owner and lessee the Delaware City road ceased operations and the New Castle Co. began a freight and passenger automobile service. The route covered is a little more than nine miles long and leads over excellent roads, so that little trouble is expected on that account.

Hindoo Tire Factory for Calcutta.

With the idea of absorbing the local trade, which has attained to not inconsiderable proportions, an attempt is being made by a group of Indian capitalists to establish a tire manufacturing business in Calcutta. While a good deal of rubber is now being grown in parts of India and Burma, it is at present shipped to England, manufactured into tires and reshipped to India. High hopes are attached to the project through the possibilities of saving the double shipment charges, duties and one or more middlemen's profits.

TRUCKS STILL BARRED FROM DOCKS

Important Question Still Unsettled—Insurance Bogey No Longer a Factor—Pier Owners Explain Their Actions.

Although nearly a year ago it looked as if all the piers and docks on New York's water front were to be opened to gasoline trucks, the problem at present seems hardly nearer a final settlement than before. Of the 41 dock managers concerned, 22 already have opened their piers to the motor-driven truck, but the attitude of the remaining 19 is somewhat discouraging—the more so as the latter include all the big transatlantic steamship companies and the more important coastwise lines. Among those which admit motor trucks to their docks are, of necessity, all ferry and railroad lines, the Hudson River lines and the United Fruit, Ward, Munson and Red "D" lines.

The uncompromising attitude of the dock proprietors is maintained, it would appear, largely through lack of confidence in the real safety of operation of the gasoline motor truck, or perhaps, through timidity inspired by the great risks continually run, this despite repeated assertions to the contrary. The insurance question, which continually has been paraded as an excuse for excluding motor trucks, fast is losing its power as a restrictive influence—at least such is the assertion of the insurance men themselves. Although some of the pier managers continue to bring forward the existence of certain warranties which were signed several years ago and which forbid the admittance to motor trucks to piers. Manager Willis C. Robb, of the New York Fire Exchange, is authority for the statement that all such agreements have been canceled and are not now considered in force by the exchange. Last fall a ruling was obtained from the exchange whereby that organization announced its decision of requiring no further prohibitive rates from dock owners who admitted trucks to their premises. The policies at present in force, according to Manager Robb, not only permit the use of trucks on piers for haulage purposes, but require no extra premium where trucks are so employed.

Among the many answers given by pier owners and dock managers as to their attitude, the one of "Waiting to see what the other fellow will do" appears to be the most frequent; others, such as the Scandinavian, Holland-America, Royal Mail Packet, Panama, and Italian lines, are very much against admittance of the trucks under any circumstances, the first two mentioned going so far as to express the opinion that their companies will never consent to their use on piers. It is, however, probable that the growing displacement of horse-drawn trucks by motors will force their admittance.

991,111. Spring Hub. John Berner, Whitefield, Marshall county, Ill. Filed Nov. 30, 1909. Serial No. 530,662.

In a resilient wheel in combination, a hub member, pairs of parallel winged housings integral with said hub member, resilient springs carried between said parallel walls, a spoke carrying member surrounding said resilient hub, wedge shaped members on said spoke carrying member constructed to co-operate with V-shaped openings formed between the housings, side plates for retaining said hub member and said spoke carrying member in normal relationship, and means for retaining said side plates in position.

994,107. Vehicle Top Bow Holder. Sherman T. Allen, Detroit, Mich. Filed Sept. 19, 1910. Serial No. 582,631.

1. In a vehicle top bow holder, in combination with a frame piece, anchorage pins engaging transversely thereof at intervals, a locking piece normally out of locking position with respect to said anchorage pins, a key member for moving the same to locking position, and a plurality of clip members carried by the bows of the vehicle top, adapted to engage said pins within the frame piece, and to be locked in such position by the movement of said locking piece thereagainst, substantially as described.

994,121. Folding Windshield for Automobiles. Orra A. Byron, Denver, Colo., assignor of one-half to T. Watkins Fugate, Denver, Colo. Filed Feb. 13, 1909. Serial No. 477,675.

A windshield composed of two hinged members, the hinge pintle of the said members extending beyond the edge of the said shield, and disks coaxially mounted on the hinged pintle, on the extending portion thereof, one of the disks being secured beyond its center on one member of the shield, and the other disks being arranged on opposite sides of the first named disk, and secured beyond their center to the other members of the shield, and layers of material also mounted on the extending portion of the hinge pintle and interposed on opposite sides of the first named disk to increase friction.

994,130. Gearing. Paul Daimler, Unter-
turkheim, Germany. Filed Oct. 25, 1906. Serial No. 340,549.

In a motor vehicle, a speed changing mechanism comprising a first and a second shaft, a shaft arranged in alignment with the first shaft of the speed changing mechanism for driving a machine mounted on the said vehicle, a clutch coupling between the adjacent ends of the said shafts for connecting them together, and a third shaft situated below the second shaft of the speed changing mechanism, the said third shaft extending in both directions, gear wheels on the said motion shafts for transmitting rotary motion from the first to the second and from the latter to the third motion shaft, all combined substantially as and for the purpose set forth.

994,141. Friction Clutch. Charles T. Fletcher, Philadelphia, Pa., assignor, by mesne assignments, to Frank E. French,

In capitals, 25 cents per line.

REBUILT THOMAS CARS—The Thomas Motor Car Company has for sale a few factory rebuilt cars which carry the same guaranty as new ones. Most of these cars have been all torn down, worn parts replaced, the chassis reassembled, and the body repainted and refinished. Two particularly interesting bargains are a 70 H. P. Six Cylinder Seven Passenger Touring Car for \$2,250 (original price, \$6,000), and a Thomas Model 36 (not rebuilt), for \$600. This is the model which made the trip around the world. Other attractive propositions are listed in our descriptive bulletins, giving specific information regarding actual condition of each car. Write us, stating your wants. E. R. R. B. ABBOTT SALES CO., Sales Agents
Majestic Building, Detroit

Philadelphia, Pa. Filed Aug. 17, 1908. Serial No. 448,981.

1. A friction clutch comprising an inner drum having an outward end flange, rings mounted on said drum, a rib-and-slot connection between the rings and drum whereby they turn as one and permit axial movement of the rings, an outer drum, a detachable end flange for the outer drum, bolts connecting the end flange and the outer drum, and a second set of rings alternating with the first set of rings and peripherally notched to slidably engage the shanks of the bolts, substantially as described.

994,191. Carburetter. Jonathan Peterson, Brooklyn, N. Y. Filed Sept. 15, 1910. Serial No. 582,123.

1. In a carburetter, the combination with an open fixed air passage, of an auxiliary air intake, a gate for closing the intake, means normally holding the gate in closed position, a support for the gate, a cam carried and operated by the gate, a block engaging the cam and movable in a plane intersecting the gate support, a needle valve adjustably mounted in the block, means for holding the block against the

cam, and a fluid nozzle co-operating with the valve.

994,195. Carburetter. Sydney I. Prescott, New York, N. Y., assignor to Jonathan Peterson, Brooklyn, N. Y. Filed Apr. 21, 1910. Serial No. 556,802.

1. In a carburetter, the combination with a fluid nozzle, of a valve co-operating therewith, a support for the valve, a two-part airgate, and cams connected with the airgate and contacting with the support, whereby a movement of either part of the airgate produces a movement of the valve and support.

994,247. Removable Tubular Rim. John Clarence Cole, Chicopee Falls, Mass., assignor, by mesne assignments, to The Fisk Rubber Company, Chicopee Falls, Mass., a Corporation of Delaware. Filed July 27, 1908. Serial No. 445,498.

A vehicle wheel, and a tubular rim fixed to the felly thereof comprising one side parallel with the plane of the wheel, the opposite side being disposed at an acute angle to said plane, and an annular band secured over said inclined side, and over

the outer edge of said first-named side, there being a seat thereon for a demountable rim, together with an expansible ring bearing on said inclined side of the fixed rim, and means to force said ring against said side into locking engagement with the underside of a demountable rim mounted on the fixed rim.

994,317. Traction Engine. Pliny E. Holt, Stockton, Cal. Filed Jan. 19, 1909. Serial No. 473,194.

1. A traction mechanism comprising a main frame, a traction truck secured thereto and having side bars, idlers mounted in opposite ends of said truck, an endless traction belt passed around said idlers, a series of rollers carried by said side bars and located between said idlers, said rollers engaging the lower stretch of the belt to hold the latter in contact with the ground, a super frame secured to said side bars at a point between said idlers and above the plane of the latter, and a driving sprocket mounted in said super frame, the upper stretch of said belt being suspended from said sprocket whereby said belt is always taut irrespective of the direction of rotation of said driving sprocket.

SEEKS TO STOP AMERICAN KNIGHTS

Russell Company Claims Exclusive Rights in Canada and Prepares to Act—Peculiar Situation in Prospect.

In due course the slide valve engine probably will find its way into the courts and provide food for patent lawyers, in fact, the first indication of the sort already has appeared and though the validity of a patent is not the issue the scope of a license granted under the Knight patent is the point involved and it may prove one requiring judicial determination.

At any rate, the Russell Motor Car Co. of Toronto, holds a license under the Knight patent to manufacture and sell cars using the Knight engine in not only Canada but Australia, and it believes its scope is wide enough to prevent the importation into the Dominion, at least, of any of the three American cars—the Stearns, Columbia and Stoddard-Dayton—which recently acquired the right to make use of the now celebrated slide valve motor. Officials of the Russell company are understood to have obtained legal advice as to their rights in the premises and to be prepared to apply restraining measures when the first American-made Knight appears across the border. The probable developments, therefore, are fraught with interest.

Until about three months since the Russell Motor Car Co. was the Canada Cycle & Motor Co., under which title its Knight license was granted two years ago by the Daimler Motor Co., of England. It first used imported engines in its Russell car, but within the last twelve months it has installed in Toronto the necessary machinery for their manufacture. The Canada company maintains several branches in Australia, which explains its interest in that direction and why its license covers that territory also.

Of several stories affecting the Knight

engine, one that is but just gaining circulation is of a somewhat startling nature and is to the effect that although Charles Y. Knight, once of Chicago and now of London, appears as the sole inventor, one of his relatives residing in New England had more or less or more than less to do with the origination of the motor. Why the New England member of the family has not been heard from the story does not relate.

Parker Motor Makes an Assignment.

In order to protect all creditors the Parker Motor Co., of Hartford, Conn., on Friday last, 1st inst., made a voluntary assignment to John C. Wilson, of Portland, Conn., as a representative of the creditors. Wilson also is a director of the company, which was organized two years ago with a capital of \$100,000, and with Lewis D. Parker as president and treasurer and several well-known Hartford men as directors. It built a four-cylinder gasoline engine which acquired a good reputation, but encountered obstacles which it could not overcome. No estimate of assets and liabilities has been made public, but it is expected that creditors will receive 100 cents on the dollar.

Economy Truck in Receiver's Hands.

Following the filing of a petition in bankruptcy by three creditors on the 1st inst., Howard Hughes, of Chicago, was appointed receiver for the Economy Motor Car Co., of Joliet, Ill., of which W. R. Everett was president and which manufactured the Economy truck. No statement of assets or liabilities is yet obtainable, but as the company was known to be in straightened circumstances for several months its failure caused small surprise.

Warner Establishes Canadian Branch.

The Warner Instrument Co., of Beloit, Wis., has established a Canadian branch at 559 Yonge street, Toronto. It is in charge of Donald F. Johnston, who has represented the company in the Dominion for several years.

"HARVESTER TRUST" CHASTENED

Its Experiment of Mixing Motor Vehicles and Farm Machinery Proves Unhappy—Plans and Salesmen Upset.

From the time that it first leaked out that the great International Harvester Co. was to go into the making of automobiles and the selling of them through its 40,000 agents in the agricultural districts, there has been plenty of speculation and eager curiosity as to how the experiment was working out and as to how successfully the company might be operating among the farmers in comparison with automobile manufacturers who, while of longer experience in the making of cars, were not equipped with so immense a selling organization dealing directly with the rural communities. The Motor World is in a position to give the chief facts in the remarkable story of the strange position the Harvester company has found itself in, the story being one that shows that the best laid plans of industrial generals, like those of ordinary men, "gang oft a-glee."

Tempted by the possibilities presented in placing at least one machine per season through each of most of its 40,000 agents, the International Harvester Co. some three or four years ago set about the producing of a motor vehicle designed to fit what were assumed to be the farmers' needs. The buggy type machine was enjoying something of a boom at the time, as various manufacturers were offering machines of this class for the farmer. The International people were impressed with the arguments advanced in behalf of this type, and decided to make such a vehicle.

When the first lot had been placed with agents of the company, it soon became apparent that most of the farmers who regarded themselves as financially able to buy automobiles were also men of family, with sons who took the prerogative of

telling "the old man" what kind of automobile he should buy. To these youths the idea of a hybrid combination of old fashioned buggy with gasoline engine propulsion was not the thing at all. In effect their attitude was: "We want the biggest and reddest and fastest automobiles we can get for the money; and we don't want any danged motor buggies."

This being found to be a general condition, the Harvester people modified their plans of a huge production of motor buggies, and carried on the making of the new vehicles on only a moderate scale. With a view to meeting the evident "sporty" demand of the younger generation, negotiations were even carried on with one of the big producers of popular price touring cars and runabouts for a large share of the latter's output.

Subsequently it was thought that the situation could be met by the Harvester company's making a combination machine, on conventional lines but having a convertible body, so that the machine could be used for utility purposes and carrying service on week days but by a change of body could be made into a pleasure vehicle for evenings and Sundays. In due course of time these machines were placed in the hands of the more favored agents, but the results were again highly disappointing. The agents did not meet with the success that had been anticipated, and it was evident that the products of other automobile manufacturers were being sold right under their noses without their being able to stem the competition.

Meanwhile the sales figures for the Harvester company's principal products—agricultural machinery—were not increasing at the rate annually expected of them. This condition was not explicable by conditions of crops or business, but at last was traced directly to a lowered efficiency of that portion of the selling organization where the attempt was being made to carry along the automobiles with the regular offerings.

Thorough investigation revealed that amazingly evil effects had resulted from trying to make automobile salesmen out of men trained only in selling agricultural machinery. Figuratively speaking, one whiff of gasoline intoxicated an agricultural machinery salesman to such an extent that without being able to sell automobiles as they should be sold he was almost utterly spoiled for his regular work.

Although it is a virtual monopoly so far as concerns the general run of agricultural machinery, the "trust" long ago found that for the best results it could not successfully pursue a purely monopolistic course in the sales end, and to spur the salesmen to creative selling rather than mere order taking, it created artificial competition by maintaining subsidiary companies that in relation with one another are the hottest kind of rivals, with rival brands and types of

(Continued on page 768b)

WEST VIRGINIA LOSES A FACTORY

**Had Organized \$300,000 Company to Get It, but "Doings" in Ohio Intervened
—Two Receivers for Norwalk.**

Changing its name from the Auto Bug Co. and its product from motor buggies to conventional touring cars did not avail to save the Norwalk Motor Car Co., of Norwalk, O. It is now in the hands of a receiver, or two of them. Its last days were full of excitement and the crisis came at a moment when it appeared that a silver lining was beginning to show through the clouds.

Certain residents of Martinsburg, W. Va., had been induced to make an offer for the property and had gone so far as to organize and incorporate a \$300,000 company of the name The Norwalk Motor Car Co., and after a prolonged and embittered discussion the stockholders of the Ohio company voted by a narrow margin to accept the West Virginia offer. At this meeting it was brought out that the auditors' statement showed an excess of \$5,540 liabilities over assets.

J. P. Link, one of the dissenting stockholders, was not content with the decision of the majority, however, and the next day filed a petition against the Norwalk Motor Car Co. and its officers and directors, in which he asked for an accounting, for equitable relief and for the appointment of a receiver. A. E. Skadden and C. H. Glaser, who were president and secretary, respectively, of the Auto Bug Co., and who are directors of the Norwalk company, were singled out for special characterization in Link's petition. He alleges that they induced him and other citizens of Norwalk to part with subscriptions amounting to \$15,000, and that soon thereafter they formed the new corporation, the Norwalk Motor Car Co., which took over the assets of the Auto Bug Co., whose liabilities at that time were greater than its assets.

In response to Link's petition, H. L. Stewart was appointed receiver by the State court. On the following day, August 23, A. J. Schur, of Cleveland, also was appointed receiver, but by the Federal court, and as a result of the petition in bankruptcy filed by the Diamond Rubber Co. of New York, the Pennsylvania Rubber & Supply Co., of Cleveland, and the Cross-Gilcroft Advertising Co., also of the same city.

Cathcart Wants Mortgage Set Aside.

Claiming that they are trying fraudulently to evade the payment of a patent suit judgment of \$300, Frank H. Cathcart has brought suit against John L. Kuser and the Motor Car Specialty Co., of Trenton, N. J., of which Kuser is vice president, asking that an alleged fraudulent chattel mort-

gage for \$25,000 on the company's property held by Kuser be set aside and that the chattels of the company be sold to satisfy Cathcart's judgment. Cathcart recovered judgment last July under an agreement by which the company was to pay him for a patent. He granted the defendant several extensions in which to pay, and finally was compelled to levy on the company's property. The Sheriff found everything protected by the mortgage, which Cathcart claims was executed two days before he brought suit and was not recorded until three months later, and which he seeks to have set aside.

Lieutenant-Governor a Henry Director.

To succeed W. L. Simonton, of Chicago, Michigan's Lieutenant Governor, John Q. Ross, of Muskegon, was elected a director of the Henry Motor Car Co. at the annual meeting of the company held in that city last week. The other directors elected are C. F. Latimer, Chicago; A. E. DeMange, Bloomington, Ill.; J. J. Maloney, Chicago; John H. Moore, Muskegon; J. W. Fulton, Chicago, and A. R. Palmer, Muskegon. The directors in turn re-elected all of the old officers, as follows: President, A. R. Palmer, Muskegon; vice-president, C. F. Latimer, Chicago; secretary, P. H. DeMange, Chicago; treasurer, C. H. Latimer, Muskegon; assistant treasurer, John H. Moore, Muskegon.

Keats Alleges Unjust Railroad Rates.

A complaint has been filed with the Interstate Commerce Commission against the Oregon-Washington Railroad & Navigation Co. et al., by the H. L. Keats Auto Co., of Portland, Ore., in which it is asserted that the rate of \$7 per 100 pounds on automobiles shipped from New York City to Portland is unreasonable, unjust and exorbitant. It is further alleged that a just and reasonable rate would be not to exceed \$4.50 per 100 pounds, and they ask for an order stipulating that rate to be applied to future shipments. Reparation is also asked for.

Trade Association Formed in Calgary.

Some 15 dealers in Calgary, Alta., Can., have organized the Calgary Motor Trades Association, which will affiliate with the national organization which now is in process of formation. The officers of the Calgary association are: S. Chapin, president; B. Cockerton, first vice-president; F. R. Harriss, second vice-president; F. L. Irving, secretary-treasurer.

Schurmeier Assets Under Red Flag.

The public sale of the assets of the bankrupt Schurmeier Motor Car Co., which undertook to build trucks in St. Paul, Minn., has been set for September 27th. The company filed a voluntary petition in bankruptcy on August 1st last, admitting liabilities amounting to \$51,899 and assets of \$33,288.

EXPORT TRADE IS SPREADING OUT

**Record for July Discloses Stronger Trends
Toward Southern and Far Eastern
Markets—Lower Average Values.**

The long continued rise of American exports of automobiles, which has been so pronounced during the past twelve months, still continues, although the gains are not as great proportionately as heretofore. During the month of July, 1911, 1,025 cars were exported, valued at \$1,104,807, as compared with 764 cars worth \$1,034,483 during the same month of 1910. Parts to the value of \$255,282 were exported during July, as against \$189,812 in July of the preceding year.

Study of the report shows a general shifting of the field towards Asia, Oceania and South America, and the prevalence of low-priced cars in the shipments. While in July, 1910, the average value of exported cars was \$1,354, this sum dropped to \$1,077 in the same month of 1911. The chief interest of the report, however, centers in the big drop registered by Canada, Mexico and Great Britain. These three countries for many months past have proven the best customers for American-made automobiles, increasing their monthly purchases in leaps and bounds. During July, 1911, however, their purchases declined greatly, while those of British Oceania, Asia, South America and Other Countries showed considerable gains. Six of the twelve geographical divisions registered losses, which were outweighed by gains in the other six divisions, resulting in a net gain of six per cent. in the total exports.

The figures for the seven months ending July 31, 1911, clearly show the gradual shifting of the market towards Asia, Oceania, and South America, instead of being largely confined to Canada and Great Britain. While shipments to the latter two countries showed only slight gains, amounting to less than 10 per cent., those to South America and British Oceania increased by 180 and 340 per cent., respectively. The report in detail:

	July		Seven months ending July—

Total	\$1,224,295	\$1,360,089	\$4,975,889	\$8,641,544	\$11,096,271

(a)—These figures include both "automobiles" and "parts of."

Changes Among Prominent Tradesmen.

Bert Morley, who formerly was with the American Distributing Co., of Detroit and Jackson, Mich., has been appointed sales manager of the Kelsey Wheel Co., of Detroit, which has let contracts for the erection of a \$50,000 addition to its plant. In addition to making wheels and standard types of rims, the Kelsey company now is producing the Booth and Detroit demountables.

I. G. Berryman, previously superintendent of the Marion Motor Car Co., of Indianapolis, has been made general manager of the Wabash Gear Works, of Terre Haute, Ind. In addition to producing transmissions, clutches, shifting levers, etc., the Terre Haute concern is furnishing material and making up hubs ready for the use of wheel manufacturers.

Morton H. Luce, manager of the Velie Motor Vehicle Co.'s Boston branch, has been transferred to the company's Chicago establishment, of which he assumes the management. The Boston berth will be filled by Harold D. Bornstein, who was Luce's chief assistant.

R. P. Henderson, for five years sales manager of the Parry Buggy Co., of Indianapolis, has been elected vice-president of the Henderson Motor Sales Co. of that city, which markets the output of Cole cars. R. P. is a brother of Charles P. Henderson, general manager of the Henderson company, and has had a financial interest in it for some time.

Detroit Office for Standard Welding.

The Standard Welding Co., of Cleveland, Ohio, is this week establishing a branch office in Detroit to permit of direct representation in the state of Michigan. The office will be located in the Ford Building and will be in charge of C. E. Miller.

Penn Plans Plant in Sharon.

The Penn Motor Co., of Pittsburgh, Pa., has indicated its intention of building a plant in Sharon, Pa., for the manufacture of Penn "30" cars. The capitalization of the concern will be made \$250,000 to take care of the building of a new factory capable of large production.

SHRINKAGE OF IMPORTS CONTINUES

But Decline During July Not as Heavy as Usual—Italy Loses Most Ground While Germany Gains 70 Per Cent.

July, 1911, was not such a bad month for automobile importers as were some other months, inasmuch as during that period 80 cars, valued at \$175,741, were brought to this country, as compared with 86 cars, valued at \$180,935, during the same period of last year. The shrinkage was due chiefly to the great loss sustained by France and Italy, which, however, was practically balanced by increases in imports from Germany and the division of Other Countries. Particularly notable in the figures giving the trade with Italy is the extreme drop in the average value of the cars. This decreased from \$2,300 in July, 1910, to \$1,457 in the same month of 1911, a loss of fully 36 per cent.

Italy was the heaviest loser, both actually and proportionally, its sales to this country having decreased from \$35,039 to \$14,578, equal to a loss of 58 per cent. France, the next heaviest loser, sent \$56,142 worth of cars during July, 1911, as against \$74,098 worth in the same month of last year. Germany increased its quota from 11 cars, valued at \$19,369, to 14 cars, valued at \$33,080, a gain of over 70 per cent. in total values and of \$602 (or 34 per cent.) in the average value of each car. The division Other Countries sent \$50,472 worth of automobiles, as compared with \$23,332 in July, 1910, the average value of the imported cars from this division remaining the same as last year. Parts to the amount of \$21,710 were imported, which shows a loss of 59 per cent. when compared with the \$53,438 worth imported during July, 1910.

American Tires Still Gaining Abroad.

Automobile tires to the value of \$218,883 were exported from this country during July, 1911, as compared with \$146,080 during the same month of the preceding year, a gain of 49 per cent. Other tires to the value of \$30,455 were exported, as against \$56,096 worth in July, 1910. For the seven months ending July, 1911, the figures for automobile and other tires were \$1,464,060 and \$337,130, respectively. No corresponding figures for the same period of 1910 are available, as the Government did not list tires separately previous to July 1, 1910.

Splitdorf Opens Branch in Kansas City.

C. F. Splitdorf has established a branch in Kansas City at 1823 Grand avenue. It will be in charge of E. A. Kelley, who previously managed the Splitdorf branch in San Francisco, and will carry a complete stock of Splitdorf magnetos and other Splitdorf productions.

San Francisco, Cal.—Keaton Vulcanizing Works, under California laws, with \$50,000 capital; to manufacture a non-skid tread under patent rights.

Rockford, Ill.—Rockford Truck and Garage Co., under Illinois laws, with \$10,000 capital; to maintain a garage and deal in automobiles and accessories. Corporators—T. D. Reber, E. J. Weil.

Malden, Mass.—Irving Garage & Repair Co., under Massachusetts laws, with \$10,000 capital; to deal in automobiles and maintain and operate a garage. Corporators—Stephen K. Bender, Stanley A. Cash.

Akron, Ohio.—Standard Tire Protector Co., under Ohio laws, with \$50,000 capital; to manufacture and deal in tires. Corporators—H. N. Coulter, O. J. Bohlander, H. O. Barber, D. J. Koonce, H. A. Lane.

Muskogee, Okla.—Oklahoma Motor Wagon Co., under Oklahoma laws, with \$10,000 capital; to manufacture and deal in motor vehicles. Corporators—C. T. Chenevert, Chris M. Bradley, F. E. Fancher.

Detroit, Mich.—Auto Lock & Specialty Co., under Michigan laws, with \$25,000 capital; to manufacture automobile accessories and specialties. Corporators—John W. Hubbard, Thomas E. Ahern, F. C. Stick.

St. Louis, Mo.—The Electric Motor Car Co., under Missouri laws, with \$10,000 capital; to deal in automobiles and supplies. Corporators—Noble H. Davis, 398 shares; Arthur E. Keller and A. J. Davis, one share each.

Indianapolis, Ind.—Morton Place Automobile Co., under Indiana laws, with \$10,000 capital; to deal in automobiles and other motor vehicles. Corporators—Mary Cheney, Maybelle E. Hutchinson, I. A. Pease.

Albany, N. Y.—Mohawk Valley Automobile Co., under New York laws, with \$500 capital; to deal in automobiles and operate a garage. Corporators—William E. Milbank, Agnes C. Waldron, Frank S. Weiss.

Detroit, Mich.—American Tire Protector Co., under New Jersey laws, with \$1,000,000 capital; to manufacture appliances for automobile and other tires. Corporators—R. L. Watson, R. St. John, J. P. Donahue, all of Detroit.

Hinton, Ohio.—Hinton Garage and Supply Co., under Ohio laws, with \$5,000 capital; to deal in automobiles and maintain a garage. Corporators—L. W. Baylor, W. C. Hoobs, W. H. Garnett, F. R. Puckett, Minnie Hoobs.

Indianapolis, Ind.—Mack's Tire Filling

Co., under Indiana laws, with \$6,000 capital; to repair automobiles and other vehicles and deal in motor supplies and tires. Corporators—Edward R. Donnell, C. A. McCordle, Charles Luhring.

Indianapolis, Ind.—Auto Lighting & Electric Co., under Indiana laws, with \$3,000 capital; to manufacture gasoline and electric lights for automobiles and other

United States Tire Co.'s New Office Building Now Being Erected at Broadway and 58th Street, New York City

vehicles. Corporators—G. S. Monfort, C. R. Brown, F. C. Parker.

Kittanning, Pa.—Kittanning Motor & Transfer Co., under Pennsylvania laws, with \$5,000 capital; to operate a motor truck and transfer service. Corporators—G. H. Burns, D. L. Shaffer, J. S. Claypool, Roy M. Cox, D. E. Acland.

New York City, N. Y.—Thompson Engine Starter Co., under New York laws, with \$300,000 capital; to manufacture all kinds of machinery. Corporators—W. M. Kingsley, G. F. Scott, F. I. Eldridge, and others, all of New York City.

Martinsburg, W. Va.—The Norwalk Motor Car Co., under West Virginia laws, with

\$300,000 capital; to manufacture motor vehicles. Corporators—F. A. Minor, S. P. Hopkins, H. L. Alexander, T. W. Martin, G. W. McKown, L. H. Ware.

Youngstown, Ohio.—E. A. Wick Rubber Co., under Ohio laws, with \$3,000 capital; to deal in rubber tires for automobiles and motorcycles. Corporators—Eldridge Wick, Dudley R. Kennedy, Curtis A. Manchester, Agnes C. Hamilton, L. A. Manchester.

Pittsburg, Pa.—Standard Steel Tank & Mfg. Co., under Delaware laws, with \$100,000 capital; to manufacture tanks and other appliances for motor vehicles and other purposes. Corporators—J. L. Kountz, F. M. Strecker, M. J. Dain, all of Pittsburg, Pa.

St. Louis, Mo.—St. Louis Automobile Sales Co., under Missouri laws, with \$5,000 capital; to deal in automobiles and other motor vehicles. Corporators—Mrs. Jennie W. Donnelly, 47 shares; Denmark Donnelly, two shares; Maurice Schoenfeld, one share.

Hackensack, N. J.—American Automobile Co. of Philadelphia, under New Jersey laws, with \$50,000 capital; to manufacture and deal in automobiles and other motor vehicles. Corporators—R. D. Earle, G. M. Brewster, J. R. Ramsey, W. J. Wright, all of Hackensack.

Henderson, Ky.—Corbitt Automobile Co. of Henderson, under South Carolina laws, with \$250,000 capital; to manufacture, sell and deal in automobiles and other motor vehicles. Corporators—R. J. Corbitt, D. Y. Cooper, J. B. Owen, J. H. Bridges, A. C. Zollicoffer, S. T. Peace, M. W. Teachey, W. A. Hunt, A. A. Zollicoffer.

Donaldsonville, La.—Donaldsonville Co. Ltd., under Louisiana laws, with \$10,000 capital; to manufacture and deal in automobiles and other motor vehicles. Corporators—K. A. Aucoin, Dr. S. Moore, Dr. V. Painchaud, Dr. Henry LeBlanc, P. H. Gilbert, A. L. Shaw, A. A. Sarradet, A. Schroeder, Adolphe Netter, Charles H. Landry, Dr. E. K. Sims, A. Bloomenstil.

Recent Losses by Fire.

Jacksonville, Fla.—Eureka Garage, East Union street, totally destroyed. Loss heavy.

Remsenburg, L. I.—H. H. Joyce's garage and one automobile burned. Caused by lightning. Loss, \$6,000.

Plaquemine, La.—John Wilbert's garage on Main street and two automobiles, three buggies and one wagon burned. Loss on automobiles covered by insurance.

H. Burger, one of the partners of the Burger & Losser garage at Jackson, Mich., has sold his interest to Clifford Rhodes, a dealer in woven wire fencing. Rhodes took immediate possession.

The Long-Henderson Co., 226 Peachtree street, Atlanta, Ga., has changed its name to Cole Motor Co., of Georgia. As the name serves to indicate, Cole cars will be handled exclusively hereafter.

Benoist & Aull, dealers in supplies and pleasure cars, at St. Louis, Mo., have added commercial vehicles to their other interests. They will handle the Commer truck in the Missouri territory.

Charles A. Gover and William H. Klein have purchased the Union Garage on West Washtena street, Lansing, Mich. They intend to establish a taxicab service, in addition to doing general repair work.

H. A. Mason has purchased a half interest in the Clear Lake Auto Co., and the Forest City Auto Co., from J. S. Hanson, formerly sole owner. Mason will assume charge of the two companies, which will be continued under the old styles.

George H. Beyer has bought the property on Essex street, near Prospect avenue, Hackensack, N. J., and is building a garage and repair shop thereon. He will handle Brush and Penn "30" cars and Victor motor trucks in Bergen and Passaic counties.

Under the style the Rockford Truck & Garage Co., a new company has been organized at Rockford, Ill., with a capital of \$10,000, and T. D. Reber as president and E. J. Weil as general manager. The headquarters of the new concern will be at 814 South Main street.

H. B. Groves, manager of the United Motor Des Moines Co., has resigned his position. He is chief stockholder of the Inter-State Auto & Supply Co., and his duties in connection with the latter caused him to relinquish the management of the United Motors Co.'s branch.

Knight S. Jordan, son of David Starr Jordan, of Stanford University, has gone into the automobile business and opened salesrooms at Palo Alto, Cal., in partnership with W. Walters. The firm will be known as the Jordan & Walters Garage and will handle E-M-F cars.

Albert Kratky, who for several years conducted a garage and repair shop at the corner of Washington avenue and Eleventh street, Cairo, Ill., has sold his business to Horsford & Roberts, who conduct a garage at 810 Commercial avenue. Kratky intends to open a new garage in St. Louis, Mo.

C. E. Dunn has purchased an interest in

the Frogner Auto Co., which hitherto existed as a co-partnership between G. A. Frogner and E. M. Williams and operated a garage at Shawano, Wis. The incorporated name is the same as the old name, while the capital stock has been fixed at \$5,000.

E. C. Johnson, for several years identified with White interests in the Quaker City, has purchased the business of the late Prescott Adamson, including the agency for

United States Motor's New Philadelphia Store

Reo automobiles. He will operate under the style the E. C. Johnson Co., with headquarters at Broad and Spring Garden streets, Philadelphia, Pa.

The Bayless Motor Car Co., of Lexington, Ky., has changed hands, a new company having been formed to take over the entire business. Dr. Hugh L. McLean is president, C. M. Stratton, vice-president, and J. R. Dorman, secretary, of the new company, which will operate under the same name as the former concern.

Miss Eva Greenstein, for some years in the employment of the Fawkes Auto Co., Arthur Murphy, another employe of the same concern, and E. R. Corcoran, have formed the Motor Car Repair & Equipment Co., with headquarters at 208 Washington avenue north, Duluth, Minn. They will sell Oliver trucks and supplies.

Simultaneously with moving from 116 West Water street to 118 North Edwards street, the Kalamazoo (Mich.) Motor Co.

has changed its name to Kalamazoo Auto Sales Co. The company also has discontinued its garage business and hereafter will sell Hudson cars exclusively. Albert E. Rose is president of the company.

Owing to the recent extension of their business, so as to include several other makes of cars besides the White line, the White Motor Car Co., of Grand Rapids, Mich., has changed its name to Stratton & Woodcock Auto Co. The company has its headquarters at 118-120 Island street, and a garage and repair shop in the Becker Auto Co.'s building.

The Rambler Garage & Supply Co., on Broadway, Milwaukee, Wis., which has been conducting a garage and repair shop, as well as an accessories and supply store, has discontinued the sundries business and hereafter will devote its energies to the sale of Rambler cars exclusively. The big supplies department will be converted into a service department.

Harry J. Mich, who for twelve years has been connected with various automobile concerns in Minneapolis, Minn., at last has decided to go into business on his own account and under his own name. He has opened a garage and salesroom at 1401 Hennepin avenue, where the Maxfield Automobile Co. formerly was located. He will sell Knox and Franklin cars.

Stephen R. Hollen has been appointed receiver for Gilchrist, Peters & Burchart, veteran automobile dealers at Cincinnati, Ohio. Both Peters and Burchart died recently and the receivership was brought about by an application of the estate of Charles M. Peters, one of the partners. The assets are appraised at \$3,924.32, while its liabilities amount to \$3,829.27.

Consolidation has been effected between the Albertson Motor Car Co., of 1527 Grand avenue, and the Boyd Automobile Co., of 3100 Main street, Kansas City, Mo., under the style the Albertson Motor Car Co., with headquarters at the Grand avenue salesrooms. The company will handle Hudson and Marmon cars as general agents, and Haynes cars in Kansas City only.

A. E. Thompson has purchased an interest in the McArthur-Zollars Motor Co., of Minneapolis, Minn., and has assumed charge of the sales department. The company henceforth will be styled the McArthur-Zollars-Thompson Motor Co., with the letters "M-Z-T" entered as trademark. The company will handle the Everitt and Krit gasoline pleasure cars, the Babcock electric and the Veerac truck.

National 40 FIRST!

Elgin Stock Chassis Road Races

August 25 and 26, 1911, Elgin, Illinois

In the most gruelling contest of the year this thoroughbred car again demonstrated its superior stamina and reliability.

Zengel, in his stock National 40 (certified under Reg. No. 311), won first place in the Elgin National Trophy Race Stock Chassis 600 cu. in. and under, going 305.03 miles in 275 minutes and 39.08 seconds. The National 40 has 447 cubic inches piston displacement. It defeated five cars that had more than 100 cubic inches greater displacement, and six that sell for more than \$2,000 above the price of a National. The stock National averaged 66.4 miles per hour, the fastest time ever made over the Elgin course, and breaking the record by 3.92 miles per hour, established last year by a \$4,700 car.

Herr and Merz, both in stock National 40s (certified under Reg. No. 311), won first and second in the Illinois Trophy Race. Herr went the entire distance at the savage pace of 65.66 miles per hour—203.35 miles in 185 minutes 55.18 seconds. Merz, in his stock National, finished second, 9.65 seconds behind his team-mate, his time being 186 minutes 4.83 seconds. **Both cars finished without a stop.**

This wonderful performance eclipses the phenomenal record of the stock National 40s entered in this same race one year ago, when Livingstone, at 60.6 miles per hour, won this same race without a stop.

Over 711 Miles at Over 65 Miles Per Hour Without a Tire Change

Three cars, in the hands of three different drivers, traveling at sustained high speed, averaging 65.9 miles per hour, over a destructive road course with a stop for tires, is the most conclusive demonstration of tire economy, perfect balance and correct weight distribution in the history of motor car racing. The stock National you buy has the same well balanced chassis.

STOCK CHAMPION

Not merely these, the most important stock chassis contests of the year, but in every event where America's and Europe's foremost stock cars have contested, the National 40 has been uniformly victorious. It is the **biggest stock car winner** of the year.

The National 40 you buy is an exact counterpart of the stock National 40 we race. It has the same reliable motor that in contest gives speed and in your hands absolute dependability, complete independence of road conditions or hills. The same design and materials that endure unharmed the terrific strain of high speed, mean long and unbroken service in your hands. The same well balanced chassis that enables the National 40 to finish without a tire change means slight tire expense in everyday use. For the very reason that the stock National 40 wins, it is the most satisfactory car in your hands.

Regardless of price, power or class, the National has demonstrated its supremacy.

Innovation and Standardization.

In the light of the sage reiterations of no more than twelve months ago that the era of standardization had been reached, the disclosures of the present summer and the promised disclosures of the coming fall and winter cannot be viewed otherwise than as startling. Safe to say not in three or four years has there been as much new material for discussion among designers and the motorwise as there is at the present time, while indications are not lacking that the crowded show season of the new year will be replete with novelties in construction such as have not been witnessed for many years. The fact of the matter is that having reached a stepping stone, as it were, in the current designs that were thought to have "come to stay" the more radical element in the industry is now ready to advance to the next halting place to await the coming of the rear guard.

Engineers have always understood that

certain improvements in engine, transmission and chassis construction were available. Certain manufacturers even have gone the length of developing improved designs one or two years in advance of their introduction to the public, merely to gain the necessary knowledge of their advantages and shortcomings and with a possible secondary purpose of being prepared for the turn of events. It is partly on this account, indeed, that sudden developments in one quarter so soon are followed by corresponding developments in an entirely different one, thus giving the impression of a spontaneous upheaval of practical design. The truth of the matter is that there always is a deal of activity in progress behind the closed doors of the factory experimental shop.

The explanation for the seemingly unexpected change of policy in the manufacturing side of the industry that sooner or later will be demanded is not as far below the surface as it may seem. "Manufacturing reasons" constitute the only answer that can or need be given. To support the high experimental and production costs of new designs and the high selling figures that may be involved in introducing novel features a combination of circumstances is required that is brought about only by closest competition and a recognized need for market arousal. So long as a product of staple design will fulfil every expectation of the purchaser and every legitimate demand as well, it would be sheer prodigality to force the market with designs that were "ahead of their time."

So now that the time is ripe, there are slide valve and rotary valve motors, new oiling systems, twin spark ignition, improved carburation, power-driven air pumps, electric lights, engine starters, left hand drive and central control, radical improvements in limousine and coupe bodies and a wealth of equipment hitherto unthought of even in the eager buyer's wildest dreams. What of the vaunted movement for standardization? It is written in every line of the new progress. Only by the widest misapplication of the term was the standardized automobile thought to mean a duplicate of some other automobile of different make. The standardization of minor parts such as may be rendered uniform with economy and without loss of individuality is going bravely forward. The "standardized car" is a very present and useful reality. New standards are being

created, however, and others will follow. The real meaning of standardization was not generally understood a year ago, that is all, nor is it likely that it will be for some time to come.

The Peril of "Cutting Corners."

There are people of a certain class who always run "against traffic." If it be on the sidewalk they steadfastly keep to the left side regardless of the number of shoulders they bump and regardless of the extra effort entailed. If it be on the highway they are equally regardless of what common and legal parlance agree in calling the rule of the road. Sometimes the obsession results from heedlessness, sometimes from recklessness and sometimes from native obstinacy. On the sidewalk the effect is merely annoying. On the road, especially where motor cars are involved, the consequences are apt to be serious.

But of all the tribe of drivers who zig-zag about the road, disregard the rules in general and evince no respect for the inalienable though seldom enforceable rights of the other fellow, perhaps the most dangerous rascal is he who deliberately "cuts corners" and as deliberately seeks excuse for the practice. The worst of the habit is that it has some slight foundation, albeit one that countenances direct violation of the law in two important respects. As a disciple of road racing explains, "It is easier on the tires." And he succinctly explains:

"You must keep the orbit of your wheels the same throughout the turn. In making a turn to the left, for example, begin on the right side of the main road, taking the widest possible radius so as to cut the corner and land at the outside of the intersecting road. Thus by changing your direction only once and making as wide a sweep as the road will permit, you can get around without slackening speed and with a minimum of strain on your casings."

Which is true, very true, but evil counsel. Likewise it is cheaper to steal a loaf of bread than buy a sandwich. The rule of the road and the laws of most States demand that all traffic be kept to the right, save at the moment of passing other traffic that is moving in the same direction. Similarly it is written that no corner shall be taken save at reduced speed. The wisdom of the plan is made apparent in the success of the traffic controls of great cities. The dangers of its contravention are demonstrated with alarming frequency and

with growing frequency as motor traffic on the highways multiplies.

The idiot who struggles to reverse the movement of a turnstile door is merely funny, his brothers who persist in doggedly butting the crowd instead of keeping to their own side of the walk are annoying and hardly more. But the corner-cutting motorist and his blind half-brother Mr. Wrong-Side-of-the-Road are a menace in the land.

The Sales of Cars and of Trucks.

It was to be expected that it would not be sufficient for manufacturers to learn the art of building successful motor trucks in order to achieve the upbuilding of that branch of the industry; that they would have to learn also the art of selling them successfully appears a matter of course. Experience is fast teaching that there is as great a difference proportionately between marketing pleasure cars and business vehicles as there is between the respective methods of manufacturing them. Basically, manufacturing and merchandising methods are the same in principle in all lines of activity, but the effort to apply the same details of procedure in pleasure and commercial lines has proved expensive in more than one instance.

Difficult though it may have been to come to a realization that the elements of automobile design require a distinguishment from starting crank to muffler, according to the purpose of the vehicle, it has been even more difficult to conceive that the marketing of the two classes of vehicle required different methods. That lesson at length has been learned and well learned, too, by more than one producer. That it requires a special intelligence and special training to produce a good truck salesman is now well established. That a good truck salesman may not be equally successful as a salesman of pleasure cars likewise has proved to be the case occasionally—much to the surprise of the employer. It has been less surprising to learn that a successful pleasure car salesman could not be converted into an equally successful salesman of trucks by a mere change of title.

What has been even more difficult to master is the gospel of taking care of the customer. Without the inducements and encouragements of the pastime, which prove of big assistance in the administration of pleasure car sales business, the

marketing of trucks is thrown back on a basis of pure value received for dollar paid, and the value received is measured, not in terms of the almighty dollar itself, but in terms of service. The disgruntled purchaser of a runabout or touring car frequently can be pacified with a few kind words and some slight accommodation of one sort or another; the dissatisfied purchaser of a truck is more than a dissatisfied purchaser, he is a business man who is afflicted with a non-paying investment. The distinction is important.

Here is the germ of new-born strength that lies within the commercial vehicle side of the industry at the present time: Manufacturers and dealers are beginning to comprehend that it is not sufficient to strive to make a satisfied customer after a sale has been made; that it is necessary to begin by making the right sort of a sale

in the first place. Experienced makers and dealers have reached the conclusion that it doesn't pay to sell an equipment that is not suited to the work for which it is intended. The result of such a course is bound to prove expensive and disastrous.

"Service" is a fetish that is apt to be misunderstood. Its broadest interpretation conveys not merely the idea of carrying out a generous maintenance program, it may involve little of actual maintenance or even of continual oversight. Real service begins when the purchaser is given an equipment that will do his work as it should be done; it ends with the dealer's assurance that the equipment is being employed wisely and economically and that it is not being abused. However the actual details of procedure may vary, it is service of this deep and thorough sort that is working the uplift of the industry.

MOROSS DAYS AT BRIGHTON BEACH

Two of Them, One a Real Big Day—Burman, Sheets, Hughes and Tower Bag Everything in Sight.

After a considerable period of comparative quiet, July 3rd and 4th being the dates when last a crowd gathered to witness a series of speed battles on the seaside track, the Brighton Beach (New York City) "motordrome" was the scene of two more of E. A. Moross's racemeets on Saturday and Monday afternoons, 2nd and 4th inst., and the size of the gathering of "fans" which was on hand paid tribute to the wis-

dom of the promoter in allowing two whole months to elapse between successive race dates.

driving was none the less sensational, as he literally slid around the turns, and the crowds just could not remain seated. On Saturday he drove his big Benz twice around the mile oval in one minute and 37.89 seconds, which is considerably faster than De Palma drove when he established the then existing record of 1:40.55 at Syracuse recently. The new mile mark of 48.62 seconds he made on Monday on his second trial, his first one being clocked in 49.82, and though it was only one-tenth of a second better than his own mark of 48.72 seconds made on July 4th last, it was quite sufficient.

The parking spaces along the track and behind the grandstand on Saturday were in no danger of being taxed to their capacity

track late on Saturday, and it was not until the curtain had risen and the second event was well under way that what crowd there was made its appearance. Conforming to the usual method of procedure, the cars in the "baby" class were turned loose first, four of them lining up for a five miles sprint. The race early evolved into a procession, with Jack Towers in an E-M-F leading, and Geo. Ainslie (Penn "30"), Jack Craig (Paige-Detroit) and Armour Ferguson (Lancia) following. Once, in the second mile, Ainslie worked up almost on an equal footing with Towers, but was quickly outdistanced, and a little later Craig swung in ahead of the Penn "30" pilot, and they finished in that order in 5:55.36.

TOWERS (E-M-F) LEADING THE "LITTLE FELLOWS"

HUGHES (MERCER) BEATING BURMAN (BENZ) IN HANDICAP

dom of the promoter in allowing two whole months to elapse between successive race dates.

Metropolitan and out-of-town motorists were ripe for the meet and they came in droves. Like the last meet, it was spread over two days—though this time Sunday intervened—the first half of the program, or rather the first quarter of it if judged by the quality of the racing and the gate receipts, being completed on Saturday afternoon, and the remainder, which easily was three-quarters from the point of interest and attendance, being run off on Labor Day afternoon.

Though it almost was to be expected that some sort of a record, or "near" record, would be made—the Moross racing aggregation seldom if ever visits a town, no matter how small, without giving the local newspapers the chance to use some nice big display type on the front page telling about shattered records—it scarcely was expected that no less than two "sure enough" world's marks would go by the board. But that is just what happened. Robert Burman, the star performer of Moross's troupe, was the man who did the work, and though he had the whole track to himself and that element of visible contest which brought the spectators to their feet in the other events was missing, his

and the rails, lined two, and in some places three deep, on the succeeding day, were visible all afternoon. The really big crowd turned out on Monday. And it was a big one, too; a glance at the grandstand revealed nothing but a sea of faces, while over in the bleachers the jam of humanity was just as great.

The meet was not without accidents, though in neither of those which occurred was any one hurt beyond a bad shaking up. Both of them occurred during the second day's sport, Bert Foster, who had the mount on a Correja, being the first to thrill the crowds. He was out for practice before the racing had started, and after having made several fast laps his car skidded and overturned in the back stretch. Foster, who was riding alone, was thrown clear and was not badly hurt. The second accident came in the very last race on the program, and though it was by far the more spectacular of the two, resulted in even less injury to the occupants of the car than the other. It was Spencer Wishart with his Mercedes who this time brought the crowds to their feet as his big car swerved off the track on the grandstand turn, and after going through a light fence came to rest in a clump of bushes. A blown out tire was said to have caused the accident.

Most of the spectators got down to the

Of the five who were entered in a five miles race for cars in the 231-300 inch class but three faced the starter, and of these, Bert Foster, in a Correja, led to the beginning of the fourth mile, when Hughie Hughes, who had been loafing along in his Mercer, romped past him and won as he pleased. His time for the five circuits was 5:22.56, and J. M. Gray, Schacht pilot, was third, something like an eighth of a mile astern of the winner.

When H. Richter, in an Opel, lined up for the next race, which also was at five miles, for cars of from 301 to 450 inches displacement, Starter Wagner started an investigation of a box-like structure behind the driver's seat. The result was that Richter was asked to remove what appeared to be enough tools and other paraphernalia to stock a small sized garage. He took out some of the stuff, evidently with little relish, and then, in a fine huff, decided not to race at all and backed into the paddock. The race was started without him, and Fay Sheets, who drove a National, never was headed; Louis Disbrow, in a Benz this time and not the old familiar Pope-Hartford "Hummer," was second, and Harry Cobe, in his Indianapolis Jackson, brought up the rear. Sheets made the five laps in 4:51.80.

The ill humor into which Richter had

worked himself continued during the following event, a five miles race for cars of up to 600 inches displacement and with a minimum weight of 2,100 pounds, and as Disbrow likewise failed to put in appearance, Sheets (National) and Cobe (Jack-

in less than a minute his chances, good up to that time, were lost. Burman's time for the 50 miles was 50:07.13.

The five miles race for cars in the 161-230 inch class, with which the second day's program was started, turned out exactly

Hughes won quite easily in 5:35.10, and Gray, who drove a Schacht, was second.

Following his lowering of the one mile record for dirt tracks to 48.62, Burman came right back and at the wheel of the Opel won a five miles race for cars of from 301-450 inches displacement. It was just prior to the start of this race that the spectators were treated to quite a surprise. It was a sort of double-acting surprise, however, though few realized it till they read their morning papers the next day. It was announced that Oldfield—no less a person than Oldfield himself—would drive the Benz entry, and immediately there was a storm of applause. It was Oldfield, all right, only the public was not informed that it was not Berna, or, as he is more popularly styled, "Barney," but was Lee Oldfield, who is no relation to the other man of the same name. This was the first real race of the day and the spectators were on their feet from start to finish. Though Burman led for the whole distance it was only by a very small margin, and both Sheets, in the National, and Oldfield were within striking distance all the time. By a great burst of speed in the home stretch, however, Burman got over the wire a winner, with Oldfield second and Sheets third.

Oldfield also came out in the second heat for the Remy Brassard, taking Disbrow's place in the Mercedes, though in this race as in the other he was beaten by Burman, who thereby tightened his grip on the "\$75 per" that goes with the trophy. Kilpatrick

THERE WERE A FEW SPECTATORS PRESENT ON MONDAY—

son) fought it out, though it was not much of a fight. Sheets took the lead at the crack of the gun and Cobe could not catch him. Sheets was clocked in 5:27.67.

Burman beat Disbrow (Mercedes) and Kilpatrick (Hotchkiss) quite easily in the first heat for the Remy "meal ticket," his time for the three miles, which was the distance at which the race was run, being 2:57.05. Later Burman came out in the same Benz and won a five miles free-for-all handicap from scratch. Hughes in his Mercer was second from the 20 second mark, and Foster (Correja), who had 25 seconds, was third.

Aside from Burman's successful assaults on Father Time, the greatest interest centered around a 50 miles class E race for cars of less than 600 inches displacement and of a minimum weight of 2,100 pounds. Only four cars started, among them being the Opel, which made its first appearance in action, with Burman at the wheel. Of the others, Sheets in his blue National and Cobe with his Jackson, quit before the 20 mile mark was reached and left Hughes and Burman in possession of the field. From then on to the 37th mile it was a see-saw affair between these two, Hughes leading around the turns and Burman running away from him in the stretches. The situation was not without humor and the crowd laughed to see Hughes scud around the curves and overtake Burman in the low little Mercer, only to be left behind on the straightaways. Tire trouble put Hughes out in the 47th lap, and though he had a new tire on and was out on the track again

the same as the first race of the previous day, except that Craig in the Paige-Detroit showed more speed than he did in the other race and led Towers to the third mile. After that, however, Towers had things

LIKEWISE MORE THAN A FEW MOTOR CARS

his own way and won in 5:45.13; Ainslie (Penn "30") finished third. Similarly, a five miles race for cars in the next larger class was practically a repetition of the second number on Saturday's program, though owing to his accident in practice, Foster (Correja) was unable to start.

was third with his big red Hotchkiss smoking like a house on fire.

It was the universal verdict of the crowds in the grandstands that Burman was the hardest worked man in sight. After winning the second and final heat for the Remy Brassard, he simply hopped out of

his Benz and into his Opel and was ready for the gun in a ten miles race for cars of less than 600 inches displacement. But he had his work cut out for him in this race, as an added starter in the person of Spencer Wishart turned up. Wishart had with him the Mercedes with which he won fourth place in the 500 miles race at Indianapolis on Decoration Day, and the way he drove the car around the track made Burman open the Opel up very near to the limit. At any rate he drove a great deal faster than he did in previous races with the Opel, and the result was that Hughes in his Mercer was left far in the rear. But drive as he would Wishart was unable to catch Burman and the best he could do was to finish second. Burman's time was 9:42.30, and Hughes was third.

Following his victory in the 10 miles

It was during the last race that the only accident made in competition occurred, and though at first it appeared that Wishart and his boyish mechanic scarcely could have escaped as the heavy car ploughed down fences and small trees, they soon were seen on their feet waving their arms as an indication that they were unhurt. Later Wishart drove the car off under its own power.

The race itself was a five miles free-for-all handicap, and very nearly all the cars in the paddock lined up for the start. Owing to a protest, the handicap race on the previous day had been declared no race by the referee, and the prize money from that was added to afford a second and third prize. Burman, who started from scratch, rapidly overhauled all the others except three, though it is a question if he ever

Burman, Benz; second, Louis Disbrow, Mercedes; third, H. J. Kilpatrick, Hotchkiss. Time, 2:57.05.

Five miles, class D, free-for-all handicap—Won by Robert Burman, Benz (scratch); second, Hughie Hughes, Mercer (20 seconds); third, Bert Foster, Correja (25 seconds). Time, 5:25.25.

Fifty miles, class E, under 600 inches displacement, minimum weight, 2,100 pounds—Won by Robert Burman, Opel; second, Hughie Hughes, Mercer. Time, 50:07.13.

Monday, Sept. 4th.

Five miles, class C, 161-230 inches displacement—Won by Jack Towers, E-M-F; second, Jack Craig, Paige-Detroit; third, Geo. Ainslie, Penn "30." Time, 5:45.13.

One mile time trial by Robert Burman (Benz). Time, 48.62.

SHEETS (NATIONAL) DEFEATING COBE (JACKSON)

TOWERS (E-M-F) AND CRAIG (PAIGE) IN FINE FINISH

race, Burman again came out in the Opel in the piece de resistance, a 50 miles race for cars in the 600 inch class, and though he beat Hughes the previous day at the same distance, the tables were turned, and after leading for 21 miles Burman was forced out with tire trouble. As the Opel car is not equipped with demountable rims, a tire could not be changed in time, and Burman withdrew. Sheets in the National started having trouble early in the race and had to retire to the paddock on four successive laps to make minor adjustments. Eventually he lost so much time that his chances of winning were remote, though he kept plugging along gamely.

Wishart had tire trouble at the beginning of the race and lost five laps. Two of these he made up, catching the leaders at the 13th and again at the 26th miles, but later he had more tire trouble and lost another lap. In the meantime Hughes had been driving steadily and had had no tire troubles, the result being that he then was in the lead by a comfortable margin, which lead he maintained up to the end. His time for the 50 miles was 49:56.06, and Wishart and Sheets were second and third, respectively.

would have caught Wishart at the rate he was going when he ran off the track. Hughes won, however, from the 35 second mark, and Jack Tower (E-M-F), who had 50 seconds, and Fay Sheets (National), with 30 seconds start, were second and third, respectively. The summary:

Saturday, Sept. 2nd.

Five miles, class C, 161-230 inches displacement—Won by Jack Towers, E-M-F; second, Jack Craig, Paige-Detroit; third, Geo. Ainslie, Penn "30." Time, 5:55.36.

Five miles, class C, 231-300 inches displacement—Won by Hughie Hughes, Mercer; second, Bert Foster, Correja; third, J. M. Gray, Schacht. Time, 5:22.56.

Two miles time trial by Robert Burman (Benz). Time, 1:37.89.

Five miles, class C, 301-450 inches displacement—Won by Fay Sheets, National; second, Louis Disbrow, Benz; third, Harry Cobe, Jackson. Time, 4:51.80.

Five miles, class E, under 600 inches displacement, minimum weight 2,100 pounds—Won by Fay Sheets, National; second, Harry Cobe, Jackson. Time, 5:27.67.

Three miles, class D, free-for-all, first heat for Remy Brassard—Won by Robert

Five miles, class C, 231-300 inches displacement—Won by Hughie Hughes, Mercer; second, J. M. Gray, Schacht. Time, 5:35.10.

Five miles, class E, 301-450 inches displacement, minimum weight, 1,800 pounds—Won by Robert Burman, Opel; second, Lee Oldfield, Benz; third, Fay Sheets, National. Time, 5:02.96.

Three miles, class D, free-for-all, second heat for Remy Brassard—Won by Robert Burman, Benz; second, Lee Oldfield, Mercedes; third, H. J. Kilpatrick, Hotchkiss. Time, 2:50.90.

Ten miles, class E, under 600 inches displacement, minimum weight, 2,100 pounds—Won by Robert Burman, Opel; second, Spencer Wishart, Mercedes; third, Hughie Hughes, Mercer. Time, 9:42.30.

Fifty miles, class E, under 600 inches displacement, minimum weight, 2,100 pounds—Won by Hughie Hughes, Mercer; second, Spencer Wishart, Mercedes; third, Fay Sheets, National. Time, 49:56.06.

Five miles, class D, free-for-all handicap—Won by Hughie Hughes, Mercer (35 seconds); second, Jack Tower, E-M-F, (50 seconds); third, Fay Sheets, National (30 seconds). Time, 5:14.31.

MOTORISTS AND MOTOR VEHICLES ENGAGED IN PERFORMANCES REQUIRING RELIABILITY

Diamond Tire Artists on Tour—A crew of sign painters sent out by the Diamond Rubber Co. which just has finished a 12,000 mile trip by arriving at St. Paul, Minn.

Contrasting the Old and the New—Ezra Meeker, whose prairie schooner "record" is 8,000 miles, and J. A. Wicke, whose 1910 Glidden Moline car has done 27,500 miles

An Iowan Moline Mobilization—Forty-three farmer-motorists have just completed a 100-miles "Sociability" run from Kalona, Ia., to Washington, Brighton, Richland and return. The caravan is illustrated at the Richland end of the route. The affair was inaugurated by Messrs. Loucke & Beehm, Moline agents at Kalona, and every car was a "Dreadnaught" Moline.

Fire-Fighting Minus the Romance View of a Rambler combination at speed which indicates that the old-time "thrill" is not lacking despite the absence of the plunging steeds.

Combination Apparatus for Irvington—The new Locomobile 40-horsepower combination chemical and hose wagon that has just been installed at Irvington-on-Hudson, N. Y.

THIRTEEN CROSSED THE SIERRAS

But Only Six Returned With Perfect Scores—Girl's Pa Compels Her to Withdraw at Lake Tahoe.

There is one day in each year that Tahoe Tavern, at Lake Tahoe, which is on the state line between California and Nevada, "perks up" in honor of motorists—the date which marks the arrival of Northern California automobile owners on their annual endurance contest from San Francisco to the tavern and return, which covers a distance of 520 miles. It is more of a sociability run than an endurance contest, however, because minor adjustments and repairs of the automobile, if made during running time, entail no penalties, the essential point being to reach controls on schedule time.

Thirteen motorists engaged in the 1911 run, which left Oakland, the official starting point, on the 26th ult., headed for the lake, and after contending with all sorts of road conditions for four days, six of the number checked in at the final control with perfect scores. They were: Stanley Gowne, American; Fred Gross, Buick; Claude McGee, Buick; Stanley Jonas, Flanders; A. S. Chisholm, Franklin, and H. L. Owesney, Winton. The Elmore, driven by B. Aurandt, and a Flanders, with Halsey Smith at the wheel, reached the Oakland control within the time limit, but both were penalized for being late at other points. Both men have lodged protests with the committee, however, and hope to have their slates wiped clean.

A. S. Chisholm, at the wheel of a Franklin, was the pilot. He started from San Francisco at 7 o'clock on the morning of the 24th ult. and was followed by the other contestants at three minute intervals, by way of ferry to Oakland, in the following order: Halsey Smith, Flanders; Miss Helen Weaver, Flanders; Stanley Gowne, American; Fred Gross, Buick; Stanley Jonas, Flanders; H. L. Owesney, Winton; B. Aurandt, Elmore; C. N. Hall, Lambert; A. S. Smith, Elmore; John A. Taylor, Franklin; H. Young, Winton.

The first day's control was at Auburn and some of the best roads in the state were traversed. Stockton was the noon control; from there to Sacramento and on to Auburn by way of the new Ben Ali boulevard, the motorists encountered no difficulties whatsoever. From Auburn to the lake, however, the road leads over the famous Sierra range, going over the old Summit route to Truckee, and the path is not wholly one of peace and pleasure. This part of the trip was a harder test of tires than of motors, for although there are many hills the inclines are neither steep nor long, but covered with sharp stones.

That there was no serious accident on the long trip is considered remarkable. The schedule over the mountains made it necessary for the contestants to keep their cars going at a lively pace all the time, and when overtaken by tire trouble the drivers had to force their motors to an unusually fast pace. Miss Weaver made a false turn and got twelve miles off the course. She however reached the Tavern within the time limit, but as her father, C. N. Weaver, general manager of the Studebaker Co. of California, would not permit her to make the return journey as a contestant, the Flanders she was driving was withdrawn.

On the return from Tahoe Tavern, C. N. Hall, driving a Lambert, was compelled to withdraw on account of a broken oil connection, and A. S. Smith withdrew the Elmore after having ten successive blowouts, which caused him to be late at controls. John A. Taylor, Franklin, and H. Young, Winton, also lost perfect scores on account of being late at controls, caused by blowouts. Halsey Smith, Flanders, was late in reaching Contra Costa, the noon control on the third day and failed to remain an hour, the time set for lunch. For this he was penalized, and he has made it the basis of protests, because in his opinion it was not necessary to remain the full hour. Aurandt's penalization was due to his failure to bring the Elmore into the Sacramento control on time, the third night. He was over 30 minutes late on account of an accident near Colfax. According to Aurandt he had about five minutes to reach Colfax and was going fast, when an automobile bound for Tahoe got on the wrong side of the road and forced him to run his car up an embankment to avoid a collision. As a result he broke a spring which he repaired after checking out of Colfax, which caused him to be late in reaching Sacramento. On this he bases his protest.

San Franciscan Tests City Ordinance.

In order to test the validity of a city ordinance requiring automobile owners to affix number plates to the front of their machines, Percy J. Walker, president of the California State Automobile Association, last week presented himself at San Francisco Police Headquarters and demanded to be taken into custody for violation of the ordinance. He was released under nominal bail. It is not contended by San Francisco motorists that the ordinance is not a good one, but it is their opinion that automobile registration and licensing should be carried on by the State and not by counties or cities. Under the present conditions it is necessary to make the numbers removable, as almost every county has its own particular favorite spot in which it requires the numbers to be displayed. Confusion and freak legislation are the result of the rule of letting each municipality or county make its own laws and ordinances regarding motor traffic.

31,000 CHEER KNIGHT AT COLUMBUS

Great Throng Sees His Triumph in 200 Miles Race—Two Spills and a Horse Provide Thrills.

Drawing no less than 31,000 spectators and breaking all records for attendance at the Driving Park, the 200-mile automobile sweepstakes at Columbus, Ohio, on Sunday, 3rd inst., brought victory to Harry Knight, driving a Westcott. His time for the distance was 3 hours and 45 minutes, and for the whole period he did not leave his seat. He made only two stops—one for fuel and one for a tire. Two major accidents marred the contest, the injured being Lee Frayer, driving a Firestone-Columbus, and Ben Lawwell, a substitute mechanic on a Buick, although neither man was very seriously hurt.

It was the greatest crowd that has ever gathered at the Columbus racetrack, and the Columbus Automobile Club, which conducted the contest under A. A. A. rules, figures that it will have a profit of over \$10,000 after every bill is paid. Knight, the winner, in addition to getting the Hoster-Columbus cup as a permanent trophy, received \$500 cash, and also captured two cups offered by local hotels for the leader at 100 and 150 miles.

Frayer is credited with the fastest lap of the contest, a mile in 54 seconds. Although his accident put him out at the 86th mile he was leading at the time, and having been the leader at 50 miles he was awarded the Williams & Schlereth Automobile Co.'s cup for that achievement.

As though the speed work and accidents in the race itself were not enough, part of a shed roof south of the grandstand and loaded with small boys gave way during the middle of the race, bumping a lot of heads and bruising many shins. As the star thrill, however, a horse took fright at the roaring exhaust of one of the racers that came close to the fence. The horse jumped the fence, pulling a buggy after it, and came down the stretch in the path of the oncoming machines. Officials and others rushed out on the track to stop the runaway, and one of the cars narrowly escaped hitting some of them and striking the horse. The latter finally dashed through a gateway at the right, upsetting a motorcyclist and bruising a number of people before being stopped.

The first car to drop out was the Cino, driven by John Raimsey. Magneto trouble made its retirement necessary at 15 miles. A Ford, driven by W. G. Lake, quit at 31 miles because of ignition trouble, and a Cole, driven by John Jenkins, went out at 73 miles with a cracked cylinder. Lee Frayer, in the "Red Wing," a Firestone-Columbus racing machine, was in the lead

from the ninth mile to the 86th, when his right rear tire blew out as he was rounding the south turn. He took a long skid into some fence posts, where the machine rolled over twice with Frayer in it. He suffered intense pain, but at the hospital that night it was said that his injuries were chiefly around the hips, with a number of serious bruises and possible internal injuries.

Frayer's retirement put Knight in the lead, as Knight had been in hot pursuit all along and was gaining. It was not until the 192d mile that the Buick, then in third place, came to grief, at exactly the same point where Frayer's car met disaster. John Raimey, who had started with the Cino until it retired, was driving the Buick to relieve Frank Lawwell, whose goggles had broken. Lawwell's brother Ben was acting as mechanic. The right front tire gave way and the car skidded into the embankment, throwing Ben Lawwell high in the air. He struck a broken fence post and was badly bruised. Raimey stuck to the car, which gave him a shaking up before it came to rest. Knight's Westcott had finished some time before, and the two remaining Jacksons finished in 4:10 and 4:15 respectively.

Protest Settled; St. Louis Makes Awards.

After considering the protest of W. B. Scott, driver of the Flanders car, against H. L. Bagley, who piloted a Ford, in the St. Louis-Kansas City reliability run, the Contest Board of the American Automobile Association has ordered the award of the first prize in the roadster class to Scott. The Inter-City contest was held under the auspices of the St. Louis Automobile Dealers and Manufacturers Association, Monday, Tuesday and Wednesday, 14th-16th ult. Scott had protested on the ground that the Ford car used a cut-out and a wrapped steering wheel, neither of which was stock equipment. The protest has been sustained and the Ford car disqualified in the roadster class. The Dorris car, driven by J. E. Baker, has been awarded the cup for touring cars. The official score is:

Touring Cars.

Driver and Car.	Road Score	Technical Score	Total Score
J. E. Baker, Dorris.....	0	0	0
Herm'n Schnure, Marmon	3	0	3
C. M. Barnard, Mitchell..	9	0	9
George Neff, New Parry..	7	5	12
C. C. Donovan, Interstate	56	8	64
John H. Phillips, Hudson	12	53	65

George Bolt, Ohio.....	Withdrawn		

Roadster Class.

B. W. Scott, Flanders...	0	2	2
Frank Dunnell, Ford.....	35	0	35
G. M. Herron, Flanders..	96	2	98
*H. L. Bagley, Ford.....	0	0	0

*Disqualified.

SCRANTON SEES DE PALMA DRIVE

Local Amateurs, However, Provide the Best Finish at the Meet—Mile Time Trials in Abundance.

Two accidents, in which nobody was injured, and five efforts to break the so-called record of 1:08 for a mile on a half-mile dirt track, were the woof and warp of the entertainment provided at the Minooka Driving Park, Scranton, Pa., on Monday, 4th inst. Of the eighth competition numbers on the program, in addition to the mile time trials, Ralph DePalma won five, two of them with a Mercer and three with a Simplex. William Haupt, with a National, scored one victory, while local men of the anthracite valley divided the other two. DePalma made the best time of the day, when in the first of his two tries at the 1:08 "record" he slewed his 50-horsepower Simplex twice around the oval in 1:11.

What was the most exciting finish of the day was provided by the amateurs in a three-mile event. Dr. McGinty and Joseph Wills, both in Buicks, furnished it. McGinty had a lead of almost half a lap at the start of the last mile and seemed a sure winner until his machine suddenly swerved almost off the track. While he was righting it and getting his stride again, Wills made a fine burst of speed and passed him. The doctor went after him in the last turn and overhauled him in the stretch, winning the race.

Collision with the fence came near bringing death to Eugene Cusick, who was driving a Buick in the five-mile non-stock, Class C, free-for-all against DePalma and Haupt. A fence rail was jammed through the car's radiator when it struck. Henry Kaufman, in the first event, had run his Buick into the fence at the same point, but without much damage to himself or his car. The summary:

Two miles—Won by Ralph Ammerman, Buick; second, William Krise, E-M-F.

Three miles—Won by Ralph DePalma, Mercer.

Three miles—Won by William Haupt, National; second, Tom Jacobs, Buick.

Exhibition mile—Ralph DePalma, Simplex. Time, 1:11.

Five miles—Won by Ralph DePalma, Mercer; second, Ralph Ammerman, Buick; third, David Birtley, Buick. Time, 7:54½.

Exhibition mile—Eugene Cusick, Buick. Time, 1:21.

Three miles, amateur—Won by E. F. McGinty, Buick; second, Joe Wills, Buick. Time, 4:41½.

Five miles, non-stock, Class C, free-for-all—Won by Ralph DePalma, Simplex; second, William Haupt, National. Time, 6:39.

Exhibition mile—Ralph Ammerman, Buick. Time, 1:20½.

Three miles, non-stock, free-for-all—Won by Ralph DePalma, Simplex.

Exhibition mile—William Haupt, National. Time, 1:16¾.

Three miles, non-stock, Class C, free-for-all—Won by Ralph DePalma, Simplex; second, William Haupt, National; third, Ralph Ammerman, Buick. Time, 2:41¾.

Exhibition mile—Ralph DePalma. Time, 1:17½.

More Match Races in South Jersey.

Drawn from neighboring towns in swarms, people poured into the little town of Salem, in the southern part of New Jersey, on Labor Day, 4th inst., to witness the automobile races given under the auspices of the so-called South Jersey Motor Club. The half-mile dirt track of the Salem Driving Park Association was used; it was the first time motor cars ever were driven over the course. Several well known drivers participated in connection with a number recruited from local and nearby sources. The program, like all others of the "club," was made up of time trials and match races.

The summary:

Five mile match, Harry Ringler, Mercer, vs. W. D. Morton, Kline—Won by Ringler. Time, 7:08.15.

Five mile match, A. Padula, Abbott-Detroit, W. D. Morton, Kline, and Baker, Metz—Won by Padula. Time, 7:23.25.

Five mile match, between David, Velie, vs. Morton, Kline—Won by David. Time, 7:05.25.

Five mile handicap—Won by Padula, Abbott-Detroit (scratch); second, Meager, Kline (10 seconds). Time, 8:35.

Five mile handicap—Won by Padula, Abbott-Detroit (20 seconds); second, Ringler, Mercer (scratch). Time, 7:17.

Five mile match, Harry Ringler, Mercer, vs. R. S. Blockson, Jackson—Won by Ringler. Time, 6:37.45.

Five mile match, David, Velie, vs. Blockson, Jackson—Won by David. Time, 7:30.

One mile time trial, to beat 1:19—Mullin, Simplex. Time, 1:18.

One mile time trial, to beat 1:18—Morton, Kline. Time, 1:17.35.

One mile time trial, to beat 1:19—Ringler, Mercer. Time, 1:18.45.

Five mile match, Ringler, Mercer, vs. Padula, Abbott-Detroit—Dead heat. Time, 7:16.12.

Truck Contest Had No Cass Competitor

Through a similarity in names, it was made to appear that the Cass Motor Truck Co., of Port Huron, Mich., had a Cass truck in the recent Chicago-Detroit motor truck contest, which was not the case. Inasmuch as the Cass company had not even considered entering a truck in the contest, the confusion of names resulted in some little misunderstanding.

MARVELOUS SPEED ON MAINE SANDS

That is, it Seemed Marvelous Until Course Was Found to be Short—Rutherford Biggest Whale on Beach.

Ideal weather, complete freedom from serious accidents and the presence of thousands of visitors combined to make the automobile racemeet on the Old Orchard beach, September 4, 5 and 6, a successful affair. It was the first attempt of the Old Orchard Automobile Association to promote races at that fashionable Maine resort, and its success promises an annual meeting, but surveyors' certificates and tested watches probably will be required on future occasions.

Chief honors went to John M. Rutherford, driving a National, and Louis Disbrow, at the wheel of a Pope-Hartford. Rutherford covered what was said to be a 50-mile course with turns in 30 minutes $6\frac{1}{2}$ seconds, and Disbrow captured a 25-mile race in 15 minutes and 25 seconds, both of which are heralded as "beach records" and were so much faster than even the speedway records that on the last day it dawned on someone that something was wrong somewhere. The suspicion led to the discovery that the five miles out and home course that had been used was only two miles short.

Nearly all the races of the first day were against time, to establish records, as the course was in perfect condition. Louis Disbrow, Pope-Hartford, in an exhibition of five miles with turn, covered the distance in 3 minutes and 3 seconds, and L. F. N. Baldwin drove a Stanley Steamer over the mile course in 42 seconds. The feature of the day was the 10-mile race, in which Rutherford, National, jumped to the front at the start and held the position, although hard pressed throughout. The race for small cars had but two starters and H. J. Habick, Cole, led the way throughout the 10 miles, winning 52 seconds ahead of N. A. Mitchell, Chalmers. Time, 8:04.

The second day interest was centered in the 25 and 50 mile races, which established records for these distances. The best contest, however, was the ten miles race, between Harry Endicott, Inter-State, and H. J. Habick, Cole. Their cars were close at all times and Endicott crossed the tape one-fifth of a second in advance of Habick. Time, 7:56 $\frac{1}{2}$. Rutherford in the National in the 50-mile race, outclassed Disbrow, Pope-Hartford, and won handily, Disbrow finishing second and Mitchell, Chalmers, third. Time, 30:06 $\frac{1}{2}$. Disbrow, however, took the 25-mile race from the same contestants in the alleged record time of 15:25. Baldwin in a trial against time beat his previous effort by two seconds.

On the third day, the day when the phe-

nomenal time made on the previous days was explained by the discovery that the course was short, the feature event was a hundred miles race. Like most of the other "features" it went to John M. Rutherford, National, with Louis Disbrow, Pope-Hartford, second. The time was 98 minutes and four fifths seconds. A ten miles contest between H. J. Habick, Cole, and V. A. Nelson, Inter-State, was won by the former in 12:00 $\frac{4}{5}$. L. F. N. Baldwin, Stanley Steamer, lowered his mile record of the previous day two seconds, covering the course in 38 seconds. The summary:

Monday, September 4.

Ten miles, stock chassis—Won by H. J. Habick, Cole; second, N. A. Mitchell, Chalmers. Time, 8:04.

One mile time trials, free-for-all—Won by L. F. N. Baldwin, Stanley Steamer; second, John M. Rutherford, National; tie for third, G. C. Jessup, Buick, and Harry Endicott, Inter-State; fourth, C. L. Bowler, Pope Hartford. Time, 0:42, 0:47, 0:54 and 0:57.

Ten miles, free-for-all—Won by John M. Rutherford, National; second, Louis Disbrow, Pope-Hartford; third, C. L. Bowler, Pope-Hartford; fourth, Harry Endicott, Inter-State. Time, 6:15.

Five-mile exhibition, with turn—Louis Disbrow. Time, 3:03.

Tuesday, September 5.

Ten miles, stock chassis—Won by Harry Endicott, Inter-State; second, H. J. Habick, Cole. Time, 7:56 $\frac{1}{2}$.

Twenty-five miles, free-for-all—Won by Louis Disbrow, Pope-Hartford; second, J. M. Rutherford, National; third, Harry Endicott, Inter-State; fourth, Harry Cobe, Jackson; fifth, G. C. Jessup, Buick. Time, 15:25.

Fifty miles, free-for-all—Won by J. M. Rutherford, National; second, Louis Disbrow, Pope-Hartford; third, M. A. Mitchell, Chalmers; Harry Cobe, Jackson, did not finish. Time, 30:06 $\frac{1}{2}$.

One mile time trial—L. F. N. Baldwin, Stanley Steamer. Time, 0:40.

Wednesday, September 6.

Ten miles, match, H. J. Habick, Cole, vs. V. A. Nelson, Inter-State—Won by Habick, Cole. Time, 12:00 $\frac{4}{5}$.

One hundred miles, free-for-all—Won by John M. Rutherford, National; second, Louis Disbrow, Pope-Hartford; third, H. E. Holt, Pope-Hartford; fourth, Harry Endicott, Inter-State; fifth, C. C. Jessup, Buick. Time, 1:38:00 $\frac{4}{5}$.

One mile time trial—L. F. N. Baldwin, Stanley Steamer. Time, 0:38.

Kansas City Racemeet is Abandoned.

After making fruitless efforts to get the mile dirt track at Kansas City, Mo., in condition for a three-day racemeet, September 2nd to 4th, the Kansas City Motor Club was compelled to abandon the project.

TO RESTORE SP. EDWAY TO PUBLIC

Motorists to be Permitted Use of New York's \$6,000,000 Roadway—Another "Horse Trot" Course Gone to Seed.

When early in July the Licensed Automobile Dealers of New York City ventured to appoint a committee to wait on Park Commissioner Stover with a view of having the \$6,000,000 Harlem Speedway thrown open to motorists few they were who anticipated that the committee would receive more than a more or less formal hearing and a more or less respectful bowing-out. The Commissioner, therefore, gave cause for genuine surprise when late last week he made known his purpose to do exactly what the dealers' organization had requested.

During recent years the expensive speedway, which was more or less a political job, has been merely a training course and playground for perhaps a half hundred owners of fast horses. It has been well maintained and policed at great expense for their benefit, and as their numbers have steadily dwindled, the Commissioner's action merely follows the "rule of reason." He is losing no time in preparing the fine, wide, nearly straight stretch for its new and wider public use; it will become a parkway for pleasure vehicles of all kinds. In response to the Motor World's inquiry, the Commissioner's office stated that it would be thrown open in the "near future," no approximate date can be set, but scraping the soft surface from the nearly two miles of road will require more than a few days. The Commissioner's office also stated that it is possible that a strip at the right hand side of the road may be reserved for fast horses, but this is by no means decided. When the Speedway is thrown open it will afford direct communication through 155th street at one end and Dyckman street at the other, with Lafayette Boulevard and Riverside Drive, thus forming a parkway outlet for upper Seventh avenue, leading directly from Central Park, and forming a superb circular drive of about 20 miles.

That the Bronx Speedway, which bisects the Grand Boulevard and Concourse, will similarly be thrown open when pressure is brought to bear seems fairly certain. It is nearly five miles in length and weeds and grass have been growing on it in several places so little has it been used. The driveways on either side are sufficient for all traffic purposes and there is no great call for the throwing open of the Speedway, which nevertheless remains a practically deserted roadway. The driveways have been undergoing repairs and motorists have practically pre-empted the Speedway, which their cars have rolled so hard as to spoil it for trotting.

SOME PENALTIES OF GREATNESS

How Living Up to a Proud Reputation
Entails Unusual Demands—Experiences
of a Famous Manufacturer.

That it is possible for an automobile manufacturing company to attain the dizzy heights of "reputation" and to enjoy the sweetest fruits of overwhelming patronage by the best people, without the officers of the concern getting any distorted view that would dull their sound business sense, is shown by the frank discourse to a Motor World representative by a directing head of one such company in relation to its affairs and outlook. His remarks also indicate that in the automobile industry as elsewhere, there are some penalties to greatness, and that it imposes responsibilities quite commensurate with its rewards.

"We are on a pedestal," he explained, "and it is a position that is not without its dangers, as we all along have plainly realized. Such is the reputation of our cars that there are not a few new customers who upon buying them expect to get a more than perfect machine, that will never give trouble, never break and never require a replacement of any kind in long years of use, no matter what kind of abuse or hard service it may have. The reputation blinds them to the fact that an automobile is a mechanism working under unusual conditions of strain, shock and vibration, and that like every other complex mechanism it requires proper care and occasional replacement."

"For instance, only recently a wealthy man, but one wholly unversed in mechanical matters, complained to us that his friends who own cars of our make had persuaded him to buy one, on the ground that it would save him all kinds of money in the repair and replacement end, whereas he already had mechanical trouble after only a few weeks' use. We investigated and found that the man had employed as his chauffeur a fellow who was a Sandow in build and who, with the meagerest knowledge about driving, changed gears by brute force. He was so strong that in giving one of his mighty wrenches to the gear shift he had broken a steel ball in one of the ball bearings. These ball bearings are the most expensive and the best that we know how to get, but nevertheless he had managed to cause a breakage. The broken ball got into the transmission gears, and being so hard and sharp it raised hob with them. The owner made it plain that the reputation of our car carried with it an implied indemnity against such a happening, so we gave him an entirely new transmission gear. However, we recommended a change of chauffeurs.

"Incidents of this general character, although only occurring with a small percentage of our customers, pile up as a big item financially in the aggregate, representing an expense that owners of low or medium priced cars would not expect to shoulder on the manufacturer and that the latter would flatly refuse to take.

"Viewing another aspect of our relations with customers, it is no unmixed blessing to have a large number of them keep writing us or visiting the factory to tell us over and over again how wonderful their particular cars are. Each one of these owners seems to think that he has the most remarkable car in the world, and that the mileage, the speed and the hill climbing that he has accomplished without any cost for repairs is something that will astound not only us but the whole motoring fraternity. While we appreciate their enthusiasm, it takes a surprisingly great amount of time and patience to give each of their repeated encomiums proper attention and acknowledgement without hurting their feelings or pride by not showing in every instance a high degree of interest in an old story.

"It is because of this come-back feature of great name and high reputation, that it is a mistake for a concern like ourselves to put out a low powered or small model, except perhaps in a purely town car. People will buy the name, thinking to get in even the small car the same performance and capacity as have become recognized in the more powerful models, and they can't understand it at all when the small car with seven or eight people in it will not go 50 miles an hour over the toughest roads without breaking a spring or will not carry the load up a hill where a big car can barely go over.

"Not the least annoying feature of having a great proportion of business with very wealthy people, is that so great a part of their motoring affairs are left to chauffeurs who, like the rest of the household employes, demand a large rake-off for themselves in purchases for their employers. There are many rich men who are severe with grafting employes at their offices or factories but who tolerate all kinds of grafting by the employes at their homes, while knowing that everybody from the butler to the furnaceman is taking commissions. Some of them even think that they ought to help get a commission for their chauffeur in buying a car. Whether they want to split with the chauffeur, we don't know.

"Stocks have been dripping away in price and conditions in general business have been very uneasy, largely because of the big men not knowing exactly where they stand until anti-trust matters become less entangled and confused. Some of these men are in such a state of mind that they do not dare talk with each other, except to comment on the weather, for fear a stenog-

rapher might be behind a screen or up a chimney somewhere, taking down their conversation as the basis for criminal prosecution. Our market for cars has been equalized to some extent, however, by the fact that the bear interests have been making money just as fast as the bulls have been losing it, and a bear is just as good a customer as a bull.

"When we first brought out our trucks, we naturally thought that the selling of them might safely be placed with those of our men who had exhibited conspicuous ability in selling our pleasure cars. We gave them every chance to repeat on the commercials, but we ultimately found that they were not the men for the work. Furthermore, it was the case that when they went back to pleasure car selling again, their work was adversely affected by their commercial vehicle experience, involving them in lines of thought and selling argument that did not bring as good results as those used before. We now recognize that pleasure cars and trucks are two widely different selling propositions, and we are managing our sales organization accordingly.

"Undoubtedly our success and present position inspires considerable envy on the part of others, and they may fancy that we are dwelling in an atmosphere of hauteur and smug security. We ourselves realize that, as in most things, it is the most fit who survive and that constant vigilance and effort are necessary for commercial eminence."

Lawyer Loses Suit on Unusual Point.

Although a suit for \$350, brought by George L. Kaeser, a garage owner, of 926 Farmington avenue, Hartford, Conn., against Howard J. Bloomer, a lawyer of the same town, did not contain any extraordinary or remarkable facts worthy of recording, it did develop into a veritable "cause celebre" from a legal standpoint and will come before the Supreme Court for final decision. The lawyer had his automobile repaired in the garage of complainant and refused to pay the bill, claiming that damage had been done to the machine.

When the case came up for trial the defendant lawyer was represented in court by an attorney, but the moment the prosecuting attorney rested his case Bloomer arose and, acting as his own counsel, called a witness to the stand and examined him. He then offered himself as witness and thereby aroused a storm of protest from the opposing lawyer, who claimed that an attorney could not testify as witness in a case with which he was connected. The judge sustained the objection and the defendant-lawyer was not allowed to testify. Bloomer filed an appeal on the ground that he, as defendant, was prevented from testifying in his own behalf, and the Supreme Court will have an opportunity to decide this important question.

WAVERLEY'S ELECTRIC LIMOUSINE

Indianapolis Manufacturers Evolve Model to Compete With Gasolene Vehicle—Its Dignity and Characteristics.

With the object of forcing the electric vehicle into active competition with all other forms of town car, the Waverley Co., of Indianapolis, Ind., has developed a new

THE NEW WAVERLEY FIVE PASSENGER LIMOUSINE ELECTRIC

enclosed model, which it terms a Limousine Electric, and which, besides seating five passengers, has the merit of affording the driver an unobstructed view through the front window. The machine, too, is a "full-sized" car, having a wheel base of 104 inches, a body sill 129 inches long and an over-all length of 144 inches.

In respect to external appearance, the new model is described as being a refinement on the lines of the French town chariot of the First Empire. Its dignity of line is plainly indicated by the accompanying illustrations, in one of which the seating arrangement also is depicted. The departure from the "Sedan" outline and its corresponding method of suspension, which, in the minds of some is believed to be "overworked," is deliberately made with the idea that a more suitable form for the purpose can be achieved.

Mechanically, the new limousine has practically the same equipment as the standard Waverley roadster; the chief point of difference is in the wheels and in the tire equipment, which, in the new model, is 34 x 3½-inch in front and 34 x 4 in the rear. The standard form of multipolar motor used on all Waverley cars is retained, as is the flexible shaft transmission from motor to rear axle, which includes a double-universal shaft that lies directly in front of the axle and normally parallel with it, or nearly so, and which drives the full-floating

axle equipment through herringbone gears. All moving parts are thoroughly encased and run in an oil bath. The no-arc controller affords four speeds in either direction, but is so safeguarded by automatic means that it is impossible to start in either direction save by introducing the lowest speed first.

Either side lever or wheel steering may be obtained on the new model, at the option of the purchaser, the latter embracing

a wheel and sector form of gear. The braking equipment consists of a contracting band brake on the armature shaft and double internal-expanding rear wheel brakes, acting on 12-inch drums. Both sets

INTERIOR AND SEATING ARRANGEMENTS OF THE NEW WAVERLEY

of brakes are pedal operated. The spring suspension is composed of full-elliptic side members with platform members both front and rear.

STUDYING NEEDS OF TRUCK USERS

Fenner Discusses the Several Systems of Promoting Sales—Also Methods of Keeping Buyers Satisfied.

Quoting the assertion that "There are but three forms of cash business in existence today, namely, transportation, postage stamps and motor vehicles," C. D. Fenner presented a useful synopsis and discussion of the various methods of handling the sales of commercial vehicles, at a recent meeting of the Motor Truck Club of New York City. In the light of his wide observation, Fenner, who is general sales manager of the Alden Sampson Co., declared it to be the good fortune of the American branch of the truck industry to have experimented with but one of the three general selling methods which are known and practiced abroad. The method of making direct sales, which is the one chiefly practiced in the United States, in his estimation possesses superior advantages over any others. Referring to the various schemes that have been applied both here and abroad, he said:

"Methods of merchandising trucks and their service can be classed under three heads: First, straight rental; second, lease and purchase; third, straight sale. Fortunately for the industry in this country, the first two have not received the attention here that they have abroad. Of these straight rental is the simplest, most easily controlled and perhaps the most profitable. The English motor contractors are report-

ed each year as having conducted a very successful business. There is nothing to prevent a dealer from renting his demonstrating vehicles whenever opportunity of-

fers, or, indeed, from conducting a regular rental service, if he has a suitable service station.

"Lease and purchase, resorted to in some cases abroad, offers many temptations to our factory branches. In England the purchaser pays cash in advance for body and painting, one set of tires and fire insurance. He pays monthly for driver, fuel and supplies, tire repairs and replacements and liability insurance. He also pays monthly a fixed sum for storage, inspection and maintenance. He signs a chattel mortgage, or lease, making the vehicle the property of the seller until such time as it is fully paid for, and he agrees to settle the balance, which represents the cost of the chassis, less tires, plus depreciation and interest, in quarterly payments covering a term of three years.

"The above is varied somewhat by allowing the purchaser to store the vehicle on his own premises, but he must agree to allow the driver ten hours off duty at night and an additional hour in the morning for cleaning and lubricating. He must also agree to send his vehicle thoroughly cleaned once a week, on a day agreed upon, to the service station of the seller and to leave it there half a day for purposes of inspection and adjustment. It is generally found that one hour is sufficient time to detain the vehicle.

"The distance run each quarter is not to exceed 6,500 miles per vehicle, an average of 500 miles per week, and the speed is not to exceed 15 miles per hour under any conditions. While the seller undertakes to conduct a weekly inspection at his service station, to make all necessary adjustments and repairs, renew worn and broken parts and to give two complete overhauls each year, he will not be responsible for breakage due to accidents or neglect.

"Straight sale, cash on delivery, as dictated by good business judgment, is the form with which we are most familiar, though it is difficult to trace it sometimes in the complexity of the 'Try it before you buy it,' 'Show me' and 'Money back' variations now offered. Yet it is fortunately still with us, and the responsibility for maintaining this, the safest and surest method of merchandising any form of motor vehicles, rests solely with the dealer and salesman."

In further discussion of the truck marketing problem Fenner continues:

"The education of the purchaser is the great common cause. We should take advantage of every opportunity to study the conditions as they exist in each customer's particular business. Spend considerable time at his shipping door, note the quantities in which the goods come through, ride on his trucks, study his customers and their facilities for unloading, visit his stable and note how he handles his equipment, and then prepare an argument which will not only convince him absolutely that he is operating his present equipment at a

loss, but educate him to the superior advantages of motor vehicles and the increased efficiency which is to be gained by their use.

"With such an array of facts and arguments we are prepared to approach the desk of the actual purchaser. A general argument confuses him, wastes his time and yours, because you have not investigated his conditions, and you are not even sure that his transportation proposition would admit of the changes necessary for the efficient use of motors.

"In closing a sale make absolutely sure that all the details discussed are definitely mentioned in the sales agreement at the time customer signs. In delivering a vehicle leave nothing for granted. Go over and over as many times as are necessary all details of operation, care and maintenance. Make it a point to see truck and driver frequently, directly after the weekly inspection if possible. Remember that the first five or six weeks are the most important in determining the schedule of operation, the habits of the driver and the life of the truck.

"Remember your responsibility to the customer and the industry; and, even more important, don't let the customer even for one small instant forget his responsibility to the truck. After using their trucks a few days many customers forget the assurances given at the time of placing the order. Trucks are neglected, overloaded and speeded, and there is no redress.

"Two years ago I made a practice of writing a letter to my customers when they took delivery of their trucks in which I made such suggestions as the following:

"You have taken delivery of one of our trucks and we wish to thank you very much for your patronage, and to assure you of our desire to aid you in its operation and maintenance. We believe that a satisfied customer is our best form of advertising and in order that we may hold you in this class and obtain fair operating conditions for our vehicles we take this opportunity of bringing to your attention a few essential facts.

"The motor truck is a labor saving device. It is not a substitute for so many horses, but a new unit in the system of transportation. Your product must be constantly moved. Consider the units in your transportation system from the raw stock at the point purchased to the finished product in the hands of the consumer. You will find that the units that cause you the greatest amount of delay, worry and expense are those in which human and animal strength are used to the exclusion of other sources of energy.

"Up to the present time the most troublesome unit in all transportation systems has been that between the freight depot and the receiving department at the one end; between the shipping department and the freight depot at the other. In order to reduce the size of some of these troublesome

expensive units you have invested money in motor trucks and entered the transportation business in earnest.

"You are managing a railroad, but with a very important difference; there are no rails and your expensive rolling stock is subjected to shocks and vibrations on all kinds of roads and grades. The success or failure of this new unit in your business depends entirely on your management and it is of the utmost importance that principles of good management are established before the equipment has deteriorated from abuse and lack of care.

"In order to obtain the greatest benefits from the use of motor trucks you must study the quantities in which your product comes to the shipping room; its distribution; the methods of handling and loading; the duties of the drivers in delivering, collecting and obtaining receipts; the schedule of the routes to be covered; the nature of the roads, grades and chances for traffic delays. In other words, it may be advisable to make radical changes in existing conditions. We should be pleased to advise you on any details you care to submit or you may consult any one of a number of transportation engineering experts who specialize in this subject.

"One of the most important items of management is the operation and care of the vehicles and their power plants. Lay out your schedule so that your vehicles are running at a moderate speed and loaded a maximum of the time they are in service. Vehicles should not be in service more than ten hours out of every twelve. At least two hours out of every twelve should be given to care and maintenance.

"Wash each vehicle once in every twenty-four hours. After washing wipe off the running gear. Get it clean if you have to use gasoline and a scraper. As each part can be recognized test it. It may be loose, it may be worn, it may be broken, or it may simply need lubrication. A worn part may need adjustment, a badly worn part certainly needs replacement.

"Anticipate breakdowns that may occur in service. Replace the worn part when the truck is out of service. It saves delays that are more expensive than the worn part discarded. An extra vehicle or power plant in reserve is good economy.

"Give the subject of maintenance the consideration it deserves, even after a truck passes to its owner. It is worthy of the best talent in your organization. Standardize the conditions and insist on good management. Give your motor trucks 'roundhouse care.'

"I am convinced that we must provide inspection and facilities for maintenance that will aid the small user and serve to educate the big fellow with his own service organization. If the customer does not avail himself of these opportunities, but prefers to neglect and misuse his vehicle we are justified in canceling our guarantee."

Control Systems; the Trend Toward Central Locations

There is an old saying to the effect that "what cannot be cured must be endured," but while the logic of the proverb is irrefutable, the statement itself is more or less old-fashioned and out of date. Which is to say that in this present day of enlightenment there scarcely is such a word as "cannot." Particularly is the word missing from the vocabularies of members of the

levers, spark and throttle control levers and pedals. In some makes of cars some or all of these elements have been changed out of all semblance to the originals and still are far from ideal. In this respect gear shift and emergency brake levers are the most frequent offenders, and though it has been suggested that the only apparent excuse for the popularity of the present system of

more apparent. In some makes of cars both levers are placed outside the body, and while this has the advantage that it allows the driver more leg room it possesses the disadvantages that it requires the operator to reach out over the side of the body to get at the levers. This necessary stretch requires time, and as the loss of even a few seconds may mean an accident, designers

Fig. 1—Illustrating an advantageous arrangement—Stoddard-Dayton with central control and left-hand steering wheel.

Fig. 2—Overland control levers, illustrating convenience of center location and right hand drive.

engineering fraternity when that which supposedly "must be endured" entails disadvantages for which a cure apparently is not to be found. Scientists and engineers have no propensity for sitting calmly and "enduring," and consequently every day something hitherto "impossible" is accomplished.

Not a little of the accomplishment has had to do with the construction of automobiles, and though at first it might appear that some details have been perfected at the expense of others, in the majority of cases the fault-eliminating process has been spread over the entire car and few parts have been neglected. Practically every part of the car has received its share of attention and revision where necessary, but the lamentable fact remains that in many cases the changes which are made are little if any better than the original arrangement.

Perhaps that part of the car to which this best applies is the control mechanism embraced in gear shift and emergency brake

side levers is that at the time of its adoption it became a "feature of fashion," it is obvious that that is not the only reason for its continuance.

But whether such systems ever will be changed so as to eliminate side levers entirely is open to question; cars have been built wherein gear shifting operations were carried on automatically, the gear shift lever thereby being eliminated; similarly the side brake lever was eliminated on some, the brakes being operated pneumatically; but as all such arrangements entail more or less complex mechanism, and as the trend at present is toward simplicity, it is doubtful whether they ever will prove popular; the side levers therefore are likely to remain for some time at least.

Simultaneously with the advent of the high-sided body the disadvantage of the side lever arrangement where the levers are at the right of the driver and the car also is operated from the right side, became

have been quick to realize that one of the levers at least should be placed inside the body within easy reach of the driver's hand.

As to which of the levers should be inside is a rock upon which designers split. Some prefer to place the gear shift lever inside on the assumption that it is the most used, and therefore should be easiest of access, while others are of the opinion that this lever should be outside. Just which position, outside or inside, permits of the greater accessibility depends a great deal on the construction of the individual body, but it is perfectly obvious that as the emergency brake is the most important part of the car in an emergency the lever which actuates it always should be placed so as to be instantly accessible without the necessity for complicated or unnatural movements.

To overcome the disadvantage of inaccessibility or cramped quarters entailed with some systems of placing the levers

either just inside or just outside the body, there remains the alternative of placing them in the center of the footboard. Centrally located gear shift and emergency brake levers now are a feature of many makes of cars, and the fact that the number of manufacturers who are so arranging these elements of the control mechanism constantly is increasing is evidence in itself that the system possesses advantages which none other is heir to.

Not the least of the advantages of the system is that it is applicable to cars in which the steering wheel is placed on either the right or left side, in addition to which very slight alterations permit the

Barring such other considerations as have been mentioned, however, the comfort of the driver, who often is the owner, and the safety of the passengers are paramount, and on this count centrally located levers score heavily. Primarily, the location of the levers close to the driver's hand permits the maximum of leg room, while at the same time an easy, natural movement permits him to grasp either of the levers without undue stretching or exertion. The car, therefore, is easily controlled and the safety of the occupants is increased.

The necessity for only easy and natural movements is shown quite clearly in the accompanying illustrations, Fig. 1 being the

In the Stoddard-Dayton arrangement illustrated in Fig. 1 the emergency brake is shown about half on and the gear shift lever is in the neutral position. Therefore it may be seen that inasmuch as the high speed position for the gear shift lever is toward the driver and the full release position for the brake lever is away from him there could be very little chance of confusion in case of emergency, as normally the levers are more widely separated. To further increase the comfort of the driver and to make the levers equally accessible whether he be tall or short, the front seats of the Stoddard-Dayton are adjustable. Which is to say that the distance between

Fig. 3 Gear shift and emergency brake levers which are separated, as instanced by the White.

Fig. 4 -Right hand drive and control without sacrifice of room, as exemplified by the Hudson

manufacturer to offer the option of either position. Another of the advantages which the location of the levers in the center provides is that because of the comparatively short levers which may be used the driver's seat may be entered from either side. In many cases, however, this fact is overlooked and entrance is blocked by the presence of spare tires, which might as well be placed elsewhere.

From the viewpoint of the engineer centrally located levers should appeal inasmuch as a number of cross rods and shafts may be eliminated. In addition to which depreciation should be less because a greater proportion of the mechanism is fully housed and therefore less liable to injury from accident or wear due to the abrasive action of dust and road dirt. Lubrication is more easily effected because of the unit housing and other things being equal, ease of action should be greater by reason of the elimination of the friction generated in the bearings of long shafts.

new six-cylinder Knight-engined Stoddard-Dayton, and Fig. 2 being the standard Overland touring model. The Dayton Motor Car Co. is one of the latest exponents of left hand drive with centrally located control levers, and the picture shows graphically one of the greatest advantages of the arrangement, namely, the possibility of entering the driver's seat from the right side, that side being the one which invariably must be placed next to the curb in all the larger cities in the United States. For city driving, the location of the steering wheel on the left side also is an advantage in that from his position the driver is afforded a better view of overtaking vehicles and the danger of collisions when turning corners therefore is decreased. Furthermore, left hand drive permits the driver to guide the car or to change gears with his right hand, while at the same time his left hand is used as a semaphore to warn overtaking cars of intended stops or changes of direction.

the seats and the dashboard may be varied within a limited range to suit requirements. Another of the detail refinement which may be noted is that the front doors are provided with latches, by means of which they may be fastened open about an inch to provide ventilation.

In the Overland arrangement, which is illustrated in Fig. 2, the steering wheel is placed at the right, the centrally located control levers therefore being operated with the driver's left hand. The arrangement possesses many of the advantages of the other, though it differs from it in that entrance to the driver's seat is slightly more difficult because of the position of the levers near the seats. In the Stoddard-Dayton the driver goes behind the levers, whereas in the Overland he must go in front of them, or rather over them. This is a small matter, however, and is more than offset by the increased room and ease of manipulation of the levers which this position permits. Like the left hand drive

arrangement the location of the steering wheel at the right and the control levers in the center permits the driver to enter from the right side of the car—provided the entrance is not blocked by spare tires.

Though the illustration shows the Overland levers fairly close together, they are more widely separated when the car is being driven, the emergency brake lever being shown in a position to lock the wheels, while the gear shift lever is in the neutral position. Practically the same method of latching the front doors open to provide ventilation also is used, the device consisting of a small brass hook which engages an eyelet on the door.

is placed slightly further forward than the gear shift lever and always is in plain sight. But barring other considerations the application of the brake demands an entirely different set of movements than are required when shifting gears, though this in itself should prove no detriment inasmuch as all cars have to be "learned" in the first place.

The arrangement of the gear shift lever, it may be seen, is such that perfectly easy control is afforded, the hand dropping quite naturally from the steering wheel to the lever, while at the same time the entrance to the driver's seat is unobstructed. A further provision for the comfort of the

prominent of the two, it has been made slightly longer than the gear shift lever. As may be seen in the illustration, the change from steering wheel to either of the levers may be made instantly, only natural and easy movements being required.

That not all right hand controlled cars are equipped with levers in as accessible positions scarcely requires the evidence given in Fig. 5; it is a fairly well-known fact. In this picture the emergency brake lever—generally recognized to be the most important element of the control mechanism—is so placed as to be well nigh out of the operator's reach. And the worst of the situation is that though the car illustrated

Fig. 5—Strained position and loss of time necessary in stretching for badly placed control levers

Fig. 6—Left hand drive and left hand control, of which the Reo is a notable exponent.

In the arrangement of the White control elements, illustrated in Fig. 3, a still different system is shown, and while the advantages of left hand drive and centrally located gear shift levers are combined, the emergency brake lever is mounted separately at the left of the driver, one lever therefore being on each side of the steering column. Whether or not the arrangement is better than when the levers are placed together is open to question. Certain it is that except in the case of an extremely "rattled" driver there is no possibility of one lever being moved in mistake for the other.

On the other hand, the location of the emergency brake lever is such that until the driver has become thoroughly familiar with the arrangement the absence of the lever from its customary place beside the gear shift lever might cause confusion for an instant. The possibility of this contingency is remote, however, as the lever

occupants of the front seats is the neat aluminum housing over the segment, by means of which the gear shift lever is held in position. As the housing fully encloses all the moving parts these may be lubricated freely without danger of oil getting on the wearing apparel of the passengers.

The orthodox arrangement of right hand drive and control, popularized by years of use, is illustrated in Fig. 4, the picture being of a Hudson "33" touring car. Though the Hudson is not the only car in which the location of the levers is such that they are within easy reach, while at the same time leg room is not sacrificed, the arrangement is noteworthy because of the skilful designing.

The right side of the body where the levers come is curved out slightly, forming a sort of recess into which the levers fit; they are therefore out of the way of the driver's legs. Recognizing the necessity for having the emergency brake lever the more

is an old one and the manufacturers may be pardoned, particularly in view of the fact that subsequent productions have properly placed levers, other cars placed on the market to-day and to-morrow are little better. To get at the emergency brake lever the driver must stretch down nearly to his feet, with his chest jammed up against the steering wheel, and to make matters worse, the lever in many cases is placed outside of a high door.

Gear shift levers, too, often are so placed that their manipulation requires that the driver be a contortionist. Be it said to the credit of designers in general, however, that the majority of cars turned out to-day have logically arranged control levers, though some of the "latest" productions show little improvement over the earliest types in this respect.

Left hand drive with left hand control is employed on comparatively few cars and the reason it is not more frequently used

is obscure, the only apparent ones being that the human race is a "right-handed race," or that having become accustomed to driving cars from the right side, the public is unwilling to make the change. To the advantage of the left hand drive, left hand control adds absolutely unobstructed entrance to the driver's seat, and when the levers are placed outside, as they are in the Reo arrangement illustrated in Fig. 6, greater leg room for the front seat.

Left hand control, however, again brings up the question as to which of the levers, if either, should be placed inside and which should be placed outside, and as in the case of right-hand driven and controlled cars the answer depends almost entirely on the construction of the individual body. The emergency brake lever on the Reo is the outer one, and is shown in the position at which the wheels are locked, the gear shift lever being shown in the high-speed notch.

Though the application of the emergency brake would require quite a stretch on the part of the driver, the lever still is in an accessible place and easily could be reached in a hurry. Similarly, while the movement of the gear shift lever into the high speed position brings the operator's arm against the top bow, the top is not always up, and the position is but momentary at best, though the interference might be inconvenient if gears required to be shifted continually as when driving through traffic.

That the arrangement of gear shift and emergency brake levers has been the subject of considerable thought is evidenced by the number of new arrangements which continually are making their appearance, the center location of these elements of the control mechanism being the latest and as considered by many—not without reason—the best. What the future arrangement will be, whether the levers will be eliminated entirely or whether they may some day be placed on the steering column in the form of buttons or very small levers, is difficult to forecast.

Estimate of the Inner Tube "Crop."

Speaking of rubber reclaiming, the recovery of inner tubes for automobile tires is one of the pretty parts of the business, that is, if the reclaimer knows how to do it successfully, says the India Rubber World. As a rule, they contain no fabric and no metal except the valve stem which is easily cut out. They are nearly "pure" and require no acid treatment, no electrical metal gatherers, etc. Moreover, thanks to the immensity of the motor business, worn-out tubes are gathered by the million. Figuring that there are 450,000 automobiles in commission in the United States and that an average of eight tubes is used a year, it would mean an annual crop of 3,600,000 tubes; say that the average weight of the tubes be two pounds each, the total weight would be 7,200,000 pounds. Reclaimed, it would give certainly 6,000,000 pounds of high-grade stock, mostly Para.

"HARVESTER TRUST" CHASTENED

(Continued from page 750)

machinery. All of the agricultural selling territory is plotted off into territories, divisions, sections and subsections, which are constantly worked and fine-tooth combed. This system requires that the salesmen in each small subsection constantly plug away getting information at each farm as to what pieces of equipment could profitably be replaced or added, the condition of the farmer's finances and what influence can be brought to bear through the members of the family or the hired men to induce the farmer to buy new machinery from time to time, if he himself is slow to realize its need. It takes long training and experience for the salesmen to become efficient pluggers along these lines. Those of the men who were entrusted with automobile selling became imbued with an exhilaration and hurrah spirit that made them drop their regular plugging work as though it were to be forgotten in a sordid past.

Their attempt at transformation from harvesting machinery pluggers to high-flying automobile salesmen was disastrous to the company's interests, because the developing of new business and increasing of sales was neglected to a degree that was not sufficiently compensated for by the sale of automobiles. After giving the experiment plenty of time to evolve whatever merits it might have, the company was forced to the conclusion that its agricultural machinery salesmen were wholly unfitted for automobile selling, and that putting them into the work was a costly mistake, not only by reason of the time lost from their development work but also because of the bad effect on this work after they returned to it.

More recently the Harvester company has been making a purely delivery wagon type, as being more nearly in line with its class of machinery in general. Since these are strictly utility vehicles, with no pleasure car atmosphere about them, they are less disrupting to the sales organization. But these machines meet a degree of abuse in service that is unparalleled by any other of the company's products. When one of these motor delivery wagons is sold, it is pretty certain to have a strenuous first six months, during which period every member of the owner's family and a good proportion of the neighbors will have a try at driving it. If a delivery boy visits a house where there is a pretty girl in the kitchen, he is likely to leave the motor running for half an hour with the machine at rest.

Whereas nearly all farm machinery is operated by people carefully trained in its use, the motor delivery wagon is expected to give good service no matter by whom it is driven or to what extent it is abused and neglected. To fulfill the rural customer's expectations, it would have to be foolproof and breakproof. As these qualities are as yet impossible of attainment in

any mechanism, the International Harvester Co. is not making an effort to force either the production or sale of the delivery wagons, simply filling whatever legitimate demand there may be in the ordinary course of business.

As the result of its experience, the company is convinced that the automobile business is a special business in itself and cannot be blended offhand with any other. Both in the manufacturing and the selling end successful results are only to be obtained by "going through the mill" just about as the established automobile manufacturers themselves have done, according to the company's view, and it therefore has forsaken its earlier plans, which contemplated so great an activity in selling automobiles to the farmers.

Enterprise Not Wholly Required.

If resourcefulness in argument were the chief requirement, a little Irishman who made a flying trip to Pontiac, Mich., immediately the new Flanders electric was announced, would surely have gotten the Chicago agency, according to E. LeRoy Pelletier, who for the Flanders Mfg. Co. has been examining the candidates. In rough and ready style the visitor combated and partially overcame practically every objection that Pelletier could offer. When the latter pointed out that the Irishman's \$25,000 cash capital was hardly enough to swing the Chicago agency properly, and that about \$75,000 would seem the right figure, the applicant declared:

"You're wrong there, me boy, because that hard earned \$25,000 is all I have in the world, and I'd work me fingers off and hock me shirt to save it, while some guy with \$75,000 easy money would be loafing on the job."

Pelletier then tried to show that the Irishman probably could not, for instance, hope to get the wealthy Jewish trade of Chicago as successfully as an agency firm having Jewish representation in its sales force.

"You're wrong again, me lad," answered the Irishman. "It takes a man like meself to win them. An' as for the rist of the bunch, let me tell you, I'll get 'em goin' an' comin', as I am a Knight of Columbus meself and will have a Jew an' a Protestant Freemason workin' for me, an' if you can beat that for an all around combination to sell electrics and get the money, I'd like to know it!"

So overcome was Pelletier that although he could not give his resourceful caller the Chicago agency, he promised to give him an opportunity, if possible, to be with the agency rather than against it.

New South Wales's Early Show Date.

The Royal Agricultural Society of Australia will hold its annual motor show at Sydney, New South Wales, from September 30th to October 6th. Thirty-two exhibitors of automobiles have secured space.

HERE'S HUPP'S NEWEST CREATION

The "R. C. H." Runabout Proves an Attractive Car at a Popular Price—Features That Will Distinguish It.

Following closely on the heels of the announcement that the Hupp Corporation, of Detroit, Mich., was preparing to enter

ers at low rotative speeds. While the bore is only $3\frac{3}{4}$ inches, the stroke is 5 inches. It is equipped with a two-bearing crank shaft, enclosed timing gears and valve stems, thermo-syphon cooling—accounting for the large radiator capacity—fly wheel type of fan and constant level splash lubrication. The Bosch magneto is mounted on the left side, while the carburetter is on the right. By this arrangement, as the

means of a coupling shaft having a universal joint at either end. The main shaft is enclosed in a torsion tube, the forward end of which is supported by a ball type of universal joint. So great is the latitude of motion permitted by the intermediate connection referred to that it is possible for the engine to be thrown as much as one inch out of line without cramping or straining the transmission.

The gearset, which is mounted in a unit type of transmission axle, is of the three-speed type, selectively actuated, and is mounted in combination bearings; the axle system including Timken and Hyatt roller mountings and plain bearings, as conditions require. One of the good features of the change gear arrangement is the use of splined, instead of squared shafts, for carrying the sliding gears. The axle housing is of one-piece construction, fitted with a removable cap in the rear. The gear housing proper is sectioned, however, the parting line being vertical, and so arranged that the components may be removed without dismounting the axle from the car.

In respect to the mechanism of control the car embodies several very modern features, including the use of left-hand drive, central gear lever, and foot-actuated brakes. The throttle is pedal controlled, and, as in standard car construction, the left pedal is used for clutch control, while that on the right applies the external members of the double rear wheel brakes. The inner expanding brakes are actuated by the clutch pedal when fully depressed.

A ratchet device is employed in this connection, which is thrown into action by a slight forward movement of the clutch

THE NEW R. C. H. RUNABOUT, PRICE \$700 WITH EQUIPMENT

the gasoline field with a new car, the details of the new R. C. H., as that product is to be designated, likewise are disclosed. It is a light four-cylinder runabout, selling at \$700 with top, windshield, oil and gas lamps, generator, horn and tool kit. In some respects it is suggestive of former ideals of R. C. Hupp, its designer, and from whose initials its name is derived. It is entirely distinctive, however, and, like the Hupp-Yeats electric, the other automobile product of the Hupp Corporation, it is unmistakable and quite striking in appearance.

Of its noteworthy external points, the large radiator and almost flat-topped hood is the most characteristic, the general appearance of the entire vehicle being in keeping with that of the larger and more impressive cars. While it is the only gasoline car at present "in the making," it is more than intimated that in due season other models will follow. The present producing plans call for an output of 500 of the new runabouts.

Embodying the recognized advantages of the block type of motor, especially with respect to the adaptability of that style of construction to light cars, the engine, which is of 22 horsepower rated output, also possesses several distinguishing features. It is of the long-stroke type, therefore embodying considerable pulling power

manufacturer points out, danger of fire is eliminated as far as stray sparks are concerned, while permitting the gas to pass along the water jackets and between the

CONTROL AND TRANSMISSION ARRANGEMENTS OF THE NEW R. C. H.

cylinders ensures its arrival at the valves in a thoroughly mingled and warmed condition.

The large diameter cone clutch is connected to the propeller shaft proper by

pedal. The consequence is that whenever the car is left standing the clutch is held out of engagement while one set of brakes is applied. This provision has the same effect as the interlocking of the clutch gear

and emergency brake and automatically prevents difficulties through attempting to crank the motor while the gears are in mesh. The brakes, it may be added, are of 10-inch diameter and 1½-inch face, Raybestos lined.

Full elliptic rear springs, 37 inches long and 1¾ inches wide are employed, a peculiar feature of their mounting being the circumstance that they are tilted forward slightly on the lower side and attached to the under side of the axle. This arrangement, in addition to lowering the rear of the chassis, tends to overcome the effect of shocks sustained by the rear wheels and so to render the vehicle easy riding. The

want of gasolene, in order to be prepared for a possible contingency when the car will not run, even while a small amount of fuel is known to be left in the tank. Occasionally, despite an indication of an apparent inch or more of fuel depth, it will be found impossible to start, either for the reason suggested or because the car is standing on a side-sloping road so that the contents of the tank drains to the end away from the outlet.

Evolution in Elmore Two-Cycle Control.

By introducing an automatic by-pass control, which is actuated by throttle movement, the two-cycle engine of the new

enclosed body with doors, but aside from body refinements and the change in engine operation noted, does not differ materially from previous models.

Hotel Clerk President Goes to Jail.

If Frank J. Dorlon had been content with his job as cashier of Hotel Manhattan, New York, where he had been employed for ten years, and had not seen in the automobile business a short cut to wealth, he might not now be in jail. Dorlon, however, saw, or thought he saw, riches in the manufacture of automobile supplies, and more specifically in the Victor Auto Supply & Mfg. Co., at 42 West Forty-third street, New

RIGHT AND LEFT VIEWS SHOWING DETAILS OF THE R. C. H. 22 HORSEPOWER MOTOR

front springs are of semi-elliptical pattern, 33 inches long and 1½ inches wide. The wheel base is 86 inches, the tread 56 inches and the tire equipment of 30 x 3-inch dimensions, all four wheels being shod with the same size tires.

In its general construction the car is distinguished by an uncommonly liberal use of drop-forgings, cheapness and accuracy of production thereby being gained, together with high ratios of strength to weight. The design has been carried through with the idea of rapid development and assemblage and the marketing of the first lot of cars, which is to be carried out by the Hupp Corporation branches, in connection with the Hupp-Yeats sales business, will be actively prosecuted.

Gasolene Tanks That Are Deceptive.

For the reason that in some cars the piping is so arranged as not to permit the very "last drop" of fuel to be drained into the carburetter, it is well to "take soundings" at some time when the engine has stopped for

Elmore roadster model, which just has been announced by the Elmore Manufacturing Co., Clyde, Ohio, is made to run with its cylinders acting in pairs when operating under half load or less. The result is that smoother action is obtained than when all four cylinders are acting independently at low speeds. The change in operation is effected by altering the application of the pumping action which is carried out by the large ends of the two-diameter pistons. Ordinarily the compression stroke of each pump cylinder is employed in forcing gas into the distributor manifold, from which it is released simultaneously to the explosion end of another cylinder; a constant volume of gas under low pressure thus being maintained in the manifold at all times. When the new by-pass is in operation, however, the cylinders work in pairs to the extent that the compression end of one cylinder feeds the explosion end of the adjoining one directly, this action being reciprocal between each group of paired cylinders. The new roadster model has an

York City. He was elected its president, and usually presidents are supposed to provide money when it is needed. Apparently Dorlon's salary as a hotel cashier was not sufficient to meet the needs of the occasion, and he acquired the practice of "borrowing" from the hotel funds without permission.

As a result he was arrested on Wednesday of last week on a charge of embezzlement. It is stated that his peculations approximate \$50,000, which is "going some" even for a New York hotel clerk. How he got away with such a large amount is not explained, although it is said that he lost a considerable sum in his automobile venture. The specific charge against him is the embezzlement of \$222.37, which a patron of the hotel paid over. Dorlon, instead of placing the check to the credit of his employers, put it in the cash drawer and appropriated to his own use cash to the same amount. Shortly afterward a detective invited him to accompany him to the Tombs.

NEWARK TRUCK WITH CLASH GEARS

New Change Gear Mechanism Employed in a New Production from New Jersey—Other Features of Interest.

With the distinction of bearing its name—the "Newark" truck—in honor of its birthplace, which is New Jersey's largest city, a newcomer in the commercial vehicle field with a number of unusual features recently has been brought to light. The Newark Automobile Mfg. Co. is the name of the company which is producing the trucks, and it is organized under New Jersey laws, with capital of \$500,000.

NEWARK 20-24 H. P. TRUCK WITH DIRECT DRIVE ON ALL SPEEDS

The factory embraces a structure 100x75 feet on Bigelow street, near Frelinghuysen avenue, and though for the present operations will be confined to the assembling of 25 vehicles in order that they "may be immediately available for prospective customers," the manufacture of the trucks complete will be commenced in about two months. Percy F. Todd, who formerly was affiliated with the Dayton Motor Car Co., is the chief engineer, and building operations will be under the superintendence of Gustave F. Kalberg, one-time superintendent of the Long Arm System Co., of Cleveland; he will have as his assistant F. M. Seekell, formerly connected with the Grahowsky Power Wagon Co.

The truck itself belongs in the light delivery wagon class, being of 1,500 pounds capacity, and lists at \$1,800. The motor, which is mounted under a hood in front, is of the T-head type, with its four cylinders cast en bloc and is rated at 20-24 horsepower; the bore and stroke measure 3 9-16 and 4 3/4 inches, respectively, and it therefore conforms to the general definition of a long-stroke motor. Ignition is effected by means of a high tension Bosch magneto, with fixed spark, and the cooling water is circulated by means of a centrifugal pump.

Lubrication is by splash with a pump over system.

Differing from usual commercial car practice, a direct drive on all speeds is provided. To attain this end, a recently patented change gear mechanism which is styled the Johnson transmission and is controlled in the United States by the Newark Automobile Mfg. Co., is used. It is a clash gear system as differentiating from the usual type of sliding gears. Spur gears are placed on the differential and on a counter shaft, the latter being moved longitudinally to bring any set of gears desired opposite others in changing speeds and then moved backward and forward, throwing the gears in and out of mesh. Five gears are used to obtain three forward

and three reverse speeds with direct drive on all speeds.

The vehicle is controlled from the left side and it is claimed that the lever control system is so simple that a few hours' instruction is sufficient to enable any person of average intelligence to operate the truck. The tire equipment consists of 34x 4 1/2 inch pneumatics.

Fire Apparatus at Two Conventions.

In connection with the 1911 convention of the International Association of Fire Engineers, which is to be held at Milwaukee, Wis., September 19-22, an exhibition of fire apparatus, including various types of the rapidly growing class of automobile appliance, will be held in the Auditorium, in which building the meeting also will convene. After the close of the convention members of the association will proceed to Chicago by a specially chartered steamer, where they will attend the International Municipal Congress and Exposition, which is scheduled to take place during the two weeks of September 18-30. A second display of fire extinguishing appliances will be a feature of the municipal congress, as will a number of papers bearing on the study of fire fighting methods.

PREVENTIVES OF GREASE LEAKAGE

Holes in Gear Boxes That Serve the Purpose—Accidental Discovery and the Theory That is Involved.

That a vent hole is as necessary in gear boxes as it is in the crank cases of engines is the opinion of a motorist, who, after spending considerable time in attempting to locate the cause of an exudation of oil, quite by accident discovered the efficacy of a vent to prevent this trouble. Leaks, when they occur, and they are by no means uncommon, generally make their appearance when the car is running; the oil or other lubricant slowly but persistently oozing out around the shaft bearings and in some cases at the points where the selector rods enter the gear case.

It was a leak of this kind with which the motorist in question had to contend, and though better designed glands with stuffing boxes were fitted, and he even went so far as to make the gear case air-tight, so that it would hold "some pressure of air," such measures were of no avail. In describing the accident by means of which the remedy was discovered and explaining the apparent reason for the cure, he says:

"The lid of the box was held in place by means of eight studs and nuts and no doubt my experiments and investigations in the matter of the leak, which necessitated the removal of the lid a goodly number of times, had weakened the thread in the aluminum casting, for finally when tightening the nuts holding down the lid one of the studs pulled out of the box, leaving, of course, a clear hole through to the interior. Hastily I made a plug of wood for this hole, and soon afterward started off for a day's run. Next morning I found that the plug of wood was gone, but a matter which caused me far greater surprise was to find that no oil, or practically none, had leaked out of the box as usual.

After the car has been running for some little time," he opines, in explaining the reason for the phenomenon, "the heat of the engine, and that generated by the friction of the gear wheels and the foot brake, raises the temperature of the lubricant in the gear box; consequently the air within the box expands and causes a slight pressure to be set up, which drives the oil out of the bearings. The pressure may be only a pound or two above atmospheric, but even that is sufficient to carry the oil with it as it gradually escapes between the shafts and bearings.

"After my discovery, I made several runs during which the stud was left out of its position, and the amount of oil that leaked out was absolutely negligible, a mere film as compared to the tablespoonful after each day's run of yore. I have now fitted a

pressure release valve in the lid of the gear box, similar to one on the engine crank case. This prevents oil being thrown through the hole or into it, and thus blocking the passage."

The valve, he describes as being in effect merely a baffle plate and vent, and he says that while it is not absolutely necessary—a hole about one-quarter of an inch in diameter being sufficient—when used, care should be taken not to place it in a line with any of the gear pinions, in order to lessen the likelihood of its becoming clogged.

The conclusions which are reached are interesting inasmuch as the reasons and the remedy given for the condition are unusual. Nothing is said about the location of the gear box, or the temperature of it before and after running, nor is the pressure obtained mentioned, and it is not quite clear how a sufficient rise in temperature could occur unless there was something radically wrong with the bearings in the gear box.

If the clutch and gear box were a unit, which construction is fairly common, and providing the clutch were slipped continually, the resultant rise in temperature might be sufficient to cause the increased air pressure. If the gear box was separate and carried in the waist of the chassis it is unlikely that the heat of the engine would have material effect because of the almost inevitable universal joint between it and the gear box and the improbability of the heat being conducted past it to the gear box; for the same reason it is difficult to see how the heat from the brakes would have any great effect.

But the fact remains that the vent effected a cure, apparently by decreasing the pressure in the gear box, and, unless as stated, the clutch and the gear box formed a unit, it appears that the bearings on the driving and lay shafts required immediate attention.

Improving the Electric Headlight.

By altering the position of the tungsten filament coil so that its axis lies lengthwise in the lamp, instead of across it, an improvement in electric headlight construction has been brought about, which not only assists in concentrating the rays but is of further benefit in adjusting the bulb to the proper focus of the reflector. This innovation has been adopted in the new Edison Mazda six-volt headlight lamps which the General Electric Co., of Schenectady, N. Y., is bringing out and which is one of a series of new Edison Mazda lamps constructed to withstand the rigorous demands of automobile and train lighting services. The new headlights, the appearance of which is indicated by the accompanying illustration, are produced in 15, 18, 21 and 24-watt sizes, with bulbs 2 1/16 inches in diameter, fitted with Edi-Swan candelabra bases. The 15-watt size of lamp will illuminate the road to a distance of 2,000 feet ahead of the car. The drawn-

wire tungsten filament affords three times the illumination for the same current consumption as the carbon filament and effects a two-thirds reduction in the size and weight of accessory apparatus. The new

line of lamps is made in six-volt sizes for side and tail light use as well as for headlights.

Pederson's Latest Lubricating System.

In addition to its several other lubricating systems, the Pederson Lubricator Co., of New York City, has developed a special arrangement of parts designed for the continuous replenishment of oil in the

crank case of a splash and natural circulating oiling system, which is particularly adapted to installation on Ford cars. The system includes a supply tank, pump, sight-feed glass, regulator and the necessary piping. The tank is intended to be mounted on the under side of the hood base strip, while the pump is neatly attached to the

outer end of the timer shaft, thereby incidentally effecting the continuous lubrication of that important member. The regulating screw and sight-feed glass are mounted on the dash, while the delivery pipe from the sight-feed is connected to the upper petcock in the crank case. By making proper adjustment of the regulating screw just sufficient oil may be fed to the engine base to replace that used up by ordinary running conditions, so that the level of oil in the base need not be watched once the system is in working order; the only care required in connection with oiling being to see that the external reservoir is kept filled at all times. The illustration shows the general arrangement of the system.

Emergency Repairs of Electric Bulbs.

Though the usual method of procedure in the case of miniature electric bulbs which apparently have passed the useful stage, as indicated by a rupture of the filament, is to discard them and insert new ones, it occasionally happens that a bulb "burns out" on the road where a new one is not available, and in this case it often is possible, by careful manipulation, to repair them temporarily. The method, however, is only applicable to those bulbs which have metallic filaments, tungsten lamps being those which are most commonly used and which respond most readily to the treatment. The modus operandi consists in inserting the bulb in the socket with the current switched on, and by a series of gentle taps causing the broken ends of the filament to touch when the momentary incandescence will, in nine cases out of ten, cause the ends to weld together. The only drawback to the repair is that the tapping process must often be repeated each time after the lamp has been extinguished, owing to the fact that the alternate expansion and contraction of the filament tends to cleave the joint. It sometimes is possible to make the repair of a more permanent nature by lighting the lamp for an instant—not longer, or the result will be fatal—at a very slightly higher voltage, when the increased incandescence will cause a more perfect weld. If the lamp normally is for four volts, the increased voltage should not be more than six volts, higher voltage lamps being treated correspondingly.

One Way to Avoid Spark Plug Trouble.

As has been pointed out recently, one very good reason for the absence of spark plug trouble today, as compared with the period of three or four years ago, is that motorists have learned to let their spark plugs alone. The moral is plain to see. When a plug is suspected of giving trouble never attempt to mend it on the road. Replace it with a fresh one and do the repairing some other time and under more favorable circumstances. The rule holds good even if the difficulty appears to be nothing more than a loss of compression due to leaky packing.

Rambler

Motor Cars

Rambler
Sixty-four

RAMBLER big wheels and tires are a great advantage in city as well as in country driving. They not only afford added comfort, but tests have shown that tires even an inch larger in diameter and half an inch greater in width will last twice as long. Small wheels drop into the holes in the roadway, adding greatly to the discomfort and wear on tires. Big wheels and tires glide lightly over depressions, providing wide cushioning surface for comfort and tire economy. This advantage is only one of many enjoyed by Rambler owners—features of quality, comfort, safety and convenience. The Offset Crank Shaft makes possible slow driving in crowded traffic, and climbing hills easy. The Straight Line Drive saves power, the Spare Wheel saves tire worry, Rambler brakes provide complete safety, and Rambler service assures satisfaction.

The Thomas B. Jeffery Company

sions in the road

THREE WHEEL IDEA NEWLY APPLIED

Martin's Tractor for the Conversion of Horse-Drawn Vehicles—Fire Apparatus Used for a Demonstration.

With the object of testing the efficiency of converted horse-drawn apparatus, the fire department of the city of Springfield, Mass., has equipped a water tower with a Martin tractor, and is preparing to put it

driven by side chains, and which replace the front wheels of the water tower. The front wheel of the tractor is of the dual type, is pivoted, and guided through bevel gearing and a long, nearly horizontal steering column and hand wheel. The mechanism is exceedingly simple and such is the steering action accomplished by the single front wheel that the entire piece of apparatus can be turned in exceedingly small radius.

Illustrative of this point, the smaller of

right angles to the trailer, the length of the latter really limits the action of the system as a whole. Absence of skidding and slippage, better steering control, economy of first cost and economy of upkeep are other advantages claimed for the system.

Rare Trouble Due to Radiator Pipe.

That the overflow pipe of a radiator, unless carefully designed, may be the cause of an unusual species of trouble, is illustrated in the experience of a motorist who

THE MARTIN TRACTOR ATTACHED TO THE SPRINGFIELD (MASS.) WATER TOWER

into routine service. The tractor, which is of the three-wheeled pattern, is the invention of Charles H. Martin, who formerly was associated with the R. L. Morgan Co., of Worcester, Mass., but who has now completed arrangements with the Knox Automobile Co., of Springfield, to manufacture the tractor. The marketing of the product will, however, be undertaken by a separate company, which is now being formed. The new water tower already has been tested by the fire department, and is said to have shown remarkable ease of handling and general efficiency.

As far as the fire apparatus itself is concerned, the arrangement is the same as with standard horse equipment. The tractor merely replaces the horses, the assembly thus falling in the so-called semi-trailer class. The tractor is not unlike that which Martin some time ago developed for general purposes, and which was designed to be applied to any horse-drawn vehicle. As the accompanying illustrations show, the motor and transmission mechanism are mounted on a triangular frame which is supported in front by a single wheel, and in the rear by two wheels, which are

the two pictures shows the water tower being turned in an ordinary street. The street is 30 feet wide and the over-all length of the apparatus is 57 feet. As the tractor can be turned in twice its own length, merely pivoting about the rear wheels and driving through the differential, and as the entire machine may be swung at

TURNING IN 30 FOOT STREET

spent considerable time in diagnosing the case properly. After running for five or six miles it was noticed that a large quantity of water issued from the overflow pipe. This was put down to overheating and to prevent trouble from this cause, the radiator immediately was refilled. "The true cause of this peculiarity was not overheating, however," he states, "but was due to the shape of the continuation of the overflow pipe within the radiator where it extended downward for some five or six inches, forming an inverted U with the highest part of the curved tube slightly higher than the high water mark in the radiator. After running a few miles, with a cool radiator, the heat caused the water to expand and the excess, as usual, found exit through the overflow pipe, but, owing to the inside end of the pipe being considerably below the level of the water, the slightest quantity overflowing set up a siphoning effect, and this was continued until the water within the radiator had fallen below the interior end of the overflow pipe. The remedy was, of course, to remove the surplus length of pipe inside the radiator."

994,237. Divisible Rim. Frederic R. Barker, Boston, and Joseph Greenwood, Walpole, Mass. Filed Aug. 24, 1910. Serial No. 578,760.

1. The combination of a rim provided with a slot, an expansible and contractible bead provided with a pair of lugs extending through said slot, and lever means fulcrumed on said rim and normally engaging one of said lugs as a fulcrum for drawing said lugs toward each other thereby to contract said bead.

994,318. Pivoted Front Steering Truck. Pliny E. Holt, Stockton, Cal. Filed July 1, 1909. Serial No. 505,387.

1. In a tractor a main frame composed of a rectangular frame and a triangular frame having its apex extended across and beyond the said rectangular frame; supporting trucks rigidly fixed to the base beam of the triangular frame and also to a transverse beam rigidly connecting the sides of said triangular frame; a steering frame hinged to said triangular frame and having a vertical swing therefrom; and buffer springs attached to said steering frame and adapted to bear against the upper and lower sides of said triangular frame.

994,367. Changeable Drive Mechanism for Automobiles. Claude R. Basford, San Francisco, Cal., assignor of three-eighths to Walter R. Blodgett, Willets, Cal., and two-eighths to C. A. Phenegar, Oakland, Cal. Filed June 23, 1909. Serial No. 503,851.

1. In a speed changing drive mechanism for automobiles, the combination of a shaft, a changeable speed disk loose on the shaft, a differential gear casing mounted on the shaft and connected to the changeable speed disk, a drive shaft extending transversely of the first mentioned shaft, separated pinions loosely mounted on the drive shaft, the changeable speed disk having a plurality of rings, one for each of said pinions, slidable crown clutches for locking the loose pinions to the drive shaft, and a link connection between the crown clutches extending through said pinions.

994,370. Device for Starting Motors on Motor Cars from the Driver's Seat or Foot Board. Samuel Howard Boswell, Norwich, England. Filed July 10, 1909. Serial No. 506,976.

A device for starting motors on motor cars, comprising in combination, a ratchet wheel secured to the motor shaft, a plate pivoted on said shaft, a pawl carried by said plate and adapted to engage said ratchet wheel, a foot rod connected to said plate, a heel on said foot rod, a lever pivoted on said plate and adapted to be engaged by said heel, a rod operable by said lever and connected to said pawl and a spring surrounding said rod, substantially as and for the purpose described.

994,389. Attachment for Gas Engine Crank Cases. Edmund E. Hans, Minneapolis, Minn. Filed Apr. 5, 1910. Serial No. 553,665.

1. The combination, with a motor driven vehicle having a crank case adapted to con-

tain a supply of oil, of an indicator hand and dial, means for forcing oil into said crank case, a float arranged within said crank case and means operatively connecting said indicator hand with said float.

994,418. Automobile Wheel. William Allen McCauley, Brooklyn, N. Y. Filed Aug. 6, 1908. Serial No. 447,293.

An automobile wheel having a deep grooved rim provided with square upper edges and spaced oppositely disposed apertured offset portions, said rim forming an air chamber, a rubber hoop arranged over said rim provided with openings registering with the apertures of said offset portions, said hoop being provided with a central annularly grooved rib, a flexible tube filled with flexible material arranged in the groove of said rib, a segmental ring arranged on said hoop at each side of said rib provided with openings registering with the openings of said hoop, and bolts passing through the openings of said rings, hoop and offset portions of the rim for clamping said hoop over said rim to form an air tight joint, said rings extending up alongside of said flexible tube, for holding the same in position.

994,428. Controlling Mechanism for Motor Vehicles. Charles Schmidt, Cleveland, Ohio, assignor, by mesne assignments, to Packard Motor Car Company, Detroit, Mich., a Corporation of Michigan. Filed Oct. 12, 1905. Serial No. 282,512.

1. In a motor vehicle, the combination with a fixed bracket, of two levers arranged on opposite sides of the bracket, a part carried by the bracket and adapted to interlock with each lever, and means for normally holding said part in engagement with one of said levers, whereby the other lever is normally free.

994,452. Adjustable Bearing. Edward J. Frost, Jackson, Mich. Filed Mar. 21, 1911. Serial No. 615,967.

1. The combination with a rigid frame, a plurality of projections formed thereon having aligned semi-cylindrical bores, rings mounted in said bores and provided with helical grooves, U-shaped yokes extending around said rings in said grooves and having their ends projecting through holes in said frame, nuts on the ends of said yokes, and bearings mounted in said rings.

994,651. Flexible Metallic Tire. William C. Nicholson, Crown Point, Ind. Filed Sept. 29, 1910. Serial No. 584,429.

1. The combination with a wheel having a felly, of a metallic rim therefor provided with side slots and having lugs provided with transverse slots, a series of outwardly curved springs held in the slots in said lugs, a series of stationary plates disposed in the side slots and secured to the felly, a series of movable sections, slotted links pivotally securing said sections together, guide plates secured on each side of said sections and adapted to slide on the outside of said stationary plates, said guide plates being provided with inclined slots and with parallel slots, bolts passing through said inclined slots and through the ends of said curved springs, strips disposed outside of said guide plates, and bolts for holding said strips in position, said last mentioned bolts passing through the parallel slots.

994,658. Carburetting System. Henry M. Reichenbach, Yonkers, N. Y., assignors to Reichenbach Laboratories Co., Chicago, Ill., a Corporation of Illinois. Filed Oct. 19, 1909. Serial No. 523,534.

1. The combination of an internal combustion engine and a carburetting system therefor, including a compartment provided with a throttle valve, heating devices supported by said compartment, heat insulating means separating said heating devices from said compartment, a feeder for supplying liquid fuel to said heating devices, said heating devices being heated by the exhaust from the engine, and means for varying the flow of said exhaust fluid through said heating devices depending upon the suction of the engine, substantially as described.

994,673. Spark Plug. William Hagstrom, Emanuel Hagstrom, and Gustaf Hagstrom, Lindsborg, Kan., assignors to Hagstrom Brothers Manufacturing Company, Lindsborg, Kan., a Corporation of Kansas. Filed Nov. 24, 1909. Serial No. 529,663.

1. In a spark plug, the combination with a casing having an annular inwardly-extending flange at its lower end, and an insulating body carried by the casing, of a central stem supported by the insulating body and having one end projecting through and beyond the lower end of the casing to form a sparking point, said central stem having thereon within the casing and adjacent the lower end of the insulating body and inverted cup-shaped guard serving to prevent conducting bodies from being conveyed on said stem beyond such guard, and a porcelain washer surrounding the stem and supported by the annular flange at the lower end of said casing, said washer having concave lower and upper faces.

994,684. Resilient Wheel. William F. Masters, New York, N. Y. Filed July 7, 1910. Serial No. 570,572.

1. In a wheel, a wheel body, a tire having a limited rotary movement relatively to the wheel body, sets of bearings arranged at intervals between the tire and wheel body, each set of bearings having opposed concave bearing faces, and a tire tension roller arranged between the bearing faces of each set of bearings and operated by the limited rotary movement between the wheel body and tire.

994,695. Illuminating Device for Vehicles. Seymour Suits, Newark, N. J. assignor of one-half to Peter C. Brashear, New York, N. Y. Filed Feb. 14, 1910. Serial No. 543,714.

1. The combination with an automobile provided with a front pair of wheels capable of turning laterally with relation to the body of the automobile, of a stud or post erected upon the frame of the automobile, a sleeve or socket piece secured to said post, a pivot pin or plug rotatably mounted in said socket piece above said post, means for securing said pivot pin or plug in said socket piece against upward displacement, a yoke attached to said pivot pin or plug, a lamp secured to said yoke and means connected with the pivot pin or plug above said post for turning said pivot pin in its socket, substantially as described.

994,969. Armor for Tires. John M. Barnett, Oskaloosa, Iowa. Filed June 8, 1910. Serial No. 565,719.

1. An armor for tires, embodying a chain netting adapted to inclose the tread of the tire and having a plurality of blocks incorporated therein, a plurality of overlapping armor plates, and fastening means for detachably securing the armor plates to the respective blocks.

Iowans Choose Officers; Discuss Roads.

President Dickinson, of the Kossuth County Automobile Association, will continue to direct the affairs of the motorists of Kossuth county, Iowa, for the ensuing year. He was re-elected president at the annual meeting held at Algona, the county seat. The other officers are: Vice-president, Ellis McWhorter, of Burt; secretary, E. V. Swetting, of Algona; treasurer, Mayor J. W. Wadsworth, of Algona. Under the new motor laws of Iowa, each township in the state receives a part of the tax collected from motorists, which is to be used for roads under the direction of the county supervisors. As Kossuth county has received \$1,611, the association has appointed the following committee to confer with the supervisors: President Dickinson, Secretary Swetting and Clarence Paine, of Algona; M. J. Mann, Burt; J. J. Warwick, Bancroft; E. G. Rich, Ledyard; Olaf Pearson, Swea City; F. C. Newall, Fenton; J. M. Blanchard, Lone Rock; J. S. Cullen, Whittemore; Nels Johnson, Sexton; Julius Kuns, Wesley; Clark Armstrong, Yitanka; M. Walsutt, Germania; W. E. Kyler, Lu Verne; Edward Rahm, St. Benedict.

The law under which the money will be spent provides that it will be used for graveling, surfacing and macadamizing roads; dragging same and putting in cement culverts. Although its purpose is good it has

caused much dissatisfaction because the tax is apportioned to the counties in accordance with the number of townships. Some inequalities exist by reason of such apportionment, as many populous counties have a small number of townships. The first collection brought the state \$111,292.65, of which 15 per cent. is retained by the state treasurer to defray the expense of issuing licenses. Kossuth county has 28 townships, and in accordance with the division each received \$57.57, or at total of \$1,600 for the county.

Columbus Discovers Some "Easy Money."

Hereafter everything running on wheels in the city of Columbus, Ind., will have to pay a license fee and a high one—that is, everything excepting baby carriages and bicycles—if the ordinance introduced in the city council succeeds in passing. According to its provisions automobiles would have to pay \$15 or \$20 annually; motor trucks \$10; motorcycles \$5; two-horse trucks and drays \$5; one-horse delivery wagons, \$3; two-horse pleasure vehicles \$3, and one-horse carriages and buggies \$1. As is but natural, protests are coming thick and fast from all directions, particularly from automobile owners, and it is likely that the measure will be considerably amended before it finally is enacted and becomes a law.

Made Farmer Pay for Calf's Damage.

At last the worm has turned! For years past the motorist has been made the victim of the shrewd farmer who had a useless horse or a sick cow, and has had to settle for heavy "damages" said to have been inflicted by that modern juggernaut, the automobile. But finally the worm did turn, and—strange as it may seem—the farmer paid the damages and the motorist drove away \$10 richer than before the accident. A. P. Veroni, of Watseka, Ill., was the valiant knight to accomplish the unheard of. A week ago he happened to run down a stray colt which was running zigzag across the highway, and broke its leg—\$50 damages to the owner. Three days later he again came that way and a sickly-looking calf meandered in front of the car with the natural result that it was knocked into the ditch. But in the collision the fender of the car was bent and one of the lamps broken. Before the owner of the calf could say anything, the motorist prepared a bill for damages against him and demanded \$10. The startled farmer promptly paid up.

Residents of New South Wales, one of the six colonies or original states of Australia, at present have over 3,000 motor cars in active operation. The licensed drivers of motor vehicles according to recent registrations, number 4,250.

New Clubs and Club Elections.

The Hutchinson Automobile Club, of Hutchinson, Kan., has elected the following officers for the ensuing year: President, L. E. Fontron; vice-president, Rev. Mr. Stevens; secretary, W. G. Barr; treasurer, Fred C. French.

Motorists of South Haven, Mich., have organized the South Haven Automobile Club with the following officers for the ensuing year: President, Dr. C. F. Young; vice-president, C. W. Williams; secretary, E. S. Rauworth; treasurer, L. E. Parsons.

Motorists of Terre Haute, Ind., have organized the Terre Haute Automobile Club, which will affiliate with the American Automobile Association. All automobile owners of Vigo county have been invited to become charter members, and until each precinct is heard from only temporary officers will have charge. They are: Dan Lane, chairman; Dr. Patton, secretary.

Under the title of the Union County Automobile Club, motorists of Beresford, South Dakota, have organized to affiliate with the state organization. For the present temporary officers will be in charge, as invitations have been extended to owners of automobiles in the county to join the club, and when each precinct is heard from a general meeting will be held. The officers are: President, Ole Ofstad; secretary, F. B. Marquette.

Twenty-five motorists of Yorktown, Ill., have organized the Kendall County Automobile Club, which will affiliate with the state organization. Only temporary officers have been elected as it is the intention to bring all motorists of Kendall county into the organization and have each district represented by a vice-president. The temporary officials are: President, Dr. R. A. McClelland; secretary, Dr. Frazier; treasurer, W. R. Newton.

Where Motor Car Replaces the Rifle.

Down on the plains of Texas, north of Big Springs, is Equash Ranch, owned by S. S. Slaughter Co. R. L. Slaughter, or as he is more familiarly called, "Bob" Slaughter, merchant, club man, and all around good fellow, of Dallas, Texas, is president and general manager of the ranch and incidentally interested in automobiles. However, his favorite sport is hunting animals and of late he has abandoned the horse for trips and taken to motor power. It is against the law in the Lone Star State to shoot antelope, and Slaughter, being a law-abiding citizen, wouldn't shoot one for anything. So with giving up the horse he decorated the house with his guns. Now he simply gets out his trusty automobile, loads it with gasoline and a lariat, and goes out after the game. One end of the lariat is tied to the steering post of the car. When he sights a bunch of antelope, he simply throws the throttle wide open, goes down among them, guides the machine with one hand while the other handles the rope.

To Automobile and Accessory Manufacturers

Is your advertising department in need of an aggressive young advertising man—one with a "common-sense" idea of advertising, in addition to a thorough, efficient knowledge of printing and publishing?

For the past six years I have been connected with a weekly automobile journal. Four years were spent in the editorial department, and two years as business and adv. manager. This publishing experience has been supplemented by an extended study of advertising, including copy-writing, space-buying, value of mediums, circulation, publicity methods, etc.

Previous to entering the publishing field, a complete understanding of printing methods was obtained through six years' actual work as a practical printer.

My record shows steady advancement won through efficiency, loyalty and integrity.

A permanent connection is desired—one that means a good future in return for meritorious service. The best of references can be furnished.

No. 12

"INDEPENDENT" SHOW ABANDONED

A. M. A. A. Forfeits Lease to Grand Central Palace—Its Office Closed and Its President Joins N. A. A. M.

The Automobile Manufacturers Association of America will hold no show in Grand Central Palace, New York, during the first week of January next, and probably not at any other time. Although it secured a lease of the building soon after its organization in January last, it has failed to meet required payments and the fate of the organization itself appears to be in doubt.

During the last month the report has been current in inner circles that the so-called independent show had been, or would be, abandoned, but two weeks since, when a Motor World man questioned Grand Central Palace officials, it was stated that payments on the lease had been made and that it was being maintained. Yesterday, however, Captain J. A. H. Dressel, assistant manager of the Palace, admitted that the lease had gone by default and that prospects of the show being held were practically nil.

No information regarding the matter was obtainable at the office of the A. M. A. A., in the Night and Day Bank Building, which has been in charge of Herbert Longendyke, the general manager of the association. The office was securely locked when a Motor World man called yesterday and the superintendent of the building stated that Mr. Longendyke had not put in an appearance for two weeks, and that the young woman who usually was present in the office had not been around for nearly a month.

The fact that only last week Col. T. A. Campbell, president of the Imperial Auto Co., of Jackson, Mich., who is president also of the A. M. A. A., was elected to membership in the National Association of Automobile Manufacturers conveyed its own suggestion, which was strengthened

by the fact that several of the members of the Automobile Manufacturers Association of America who had been disqualified from participation in sanctioned shows because of having exhibited in the "independent" show, which was held in the Palace last January, previously had applied to the N. A. A. M. for reinstatement and had had their disabilities removed.

The A. M. A. A. grew out of this last Palace show, and, like the show itself, it was brought about by Mr. Longendyke and his partners, who publish a carriage trade journal in Troy, N. Y. It was formed to take the place of the American Motor Car Manufacturers Association and to oppose the Selden patent, but only a few days after its organization the United States Court of Appeals in New York declared that patent invalid, thereby cutting much of the ground from under the new organization. Despite the fact, some of its officials at least decided to conduct another show and secured the necessary lease, but when some three months since the National Association of Automobile Manufacturers also secured a lease of the Palace for a January show immediately following the close of the "independent" one, the cause of the Automobile Manufacturers Association of America was still further weakened and the abandonment of its project caused no surprise to those able to read the signs.

With the A. M. A. A. out of the way, it is extremely probable that the N. A. A. M. function at the Palace will be changed so that it will be run concurrent with the Board of Trade exhibit in Madison Square Garden.

Shelbyville May Get Another Factory.

John Clark, former superintendent of the Clark Motor Car Co., of Shelbyville, Ind., has practically completed the organization in that city of the Shelby Motor Car and Truck Co. Clark has in view the manufacture of a line of popular priced pleasure cars and a line of commercial vehicles which will embrace everything from a \$600 light wagon to trucks of five-ton capacity.

N. A. A. M. OPENS WIDE ITS DOOR

Fourteen New Members Are Admitted and Disabilities of Two Makers Removed—Audiences Granted Three Callers.

At the regular meeting of the executive committee of the National Association of Automobile Manufacturers, in New York, on the 6th inst., the door of the organization was swung open much wider than has been the case in quite an extended period of time. Which is to say, that no less than 14 new members were admitted and added to the roll. Of the number, by far the most surprising and significant was Col. T. A. Campbell, representing the Imperial Auto Co., of Jackson, Mich., of which he is president, and who also is president of the Automobile Manufacturers Association of America, which was formed in January last and under whose auspices the now abandoned show in the new Grand Central Palace in New York had been billed to occur during the first week in January next, immediately preceding the N. A. A. M. show in the same building.

The others elected to membership in the N. A. A. M. were as follows: J. I. Hanley, representing American Motors Co., Indianapolis, Ind.; G. A. Matthews, representing Jackson Automobile Co., Jackson, Mich.; C. H. Walters, representing DeTamble Motors Co., Anderson, Ind.; F. H. Dodge, representing Ohio Electric Car Co., Toledo, Ohio; A. B. C. Hardy, representing Marquette Motor Co., Saginaw, Mich.; George E. Daniels, representing Oakland Motor Car Co., Pontiac, Mich.; T. F. Hart, representing Inter-State Automobile Co., Muncie, Ind.; Charles D. Hastings, representing Hupp Motor Car Co., Detroit; D. A. Shaw, representing Simplex Motor Car Co., Mishawaka, Ind.; W. J. Groves, representing Mack Bros. Motor Car Co., Allentown, Pa.; R. C. Hupp, representing Hupp Corporation, Detroit; Rauch & Lang Carriage Co., Cleveland, Ohio; Fred W. Haynes,

representing Regal Motor Car Co., Detroit.

Two of the old members changed their representatives in the association, J. T. Corl replacing George A. Horner as the representative of the Rapid Motor Vehicle Co., and Charles W. Churchill succeeding Thomas Henderson as the representative of the Winton Motor Carriage Co. Mr. Henderson, who is retiring from business life, also tendered his resignation as a member of the N. A. A. M. executive committee and it was accepted, of course, but so highly is he esteemed that he was unanimously made an honorary member of the committee and a committee appointed to draw up resolutions expressing regards and regrets appropriate to the retirement of such a trade veteran. The vacancy on the executive committee was filled by the election of W. C. Leland, of the Cadillac Motor Car Co.

Two more of the manufacturers who exhibited at the last "independent" and unsanctioned show in Grand Central Palace, and who thereby disqualified themselves for participation in the N. A. A. M. shows, asked to have their disabilities removed, and their applications were granted. The two who were restored to good standing were the McFarlan Motor Car Co. and the Michigan Buggy Co.

The N. A. A. M. executive committee also voted to carry out to the end the case which it instituted in New Jersey some five years ago, with a view of testing the constitutionality of the right of any state to exact a fee and require the residents of other states to secure licenses. The several New Jersey courts successively have upheld the doctrine of states rights in the matter, and the action of the N. A. A. M. means that there will be no lack of funds to carry the case to the United States Supreme Court, and thus have the point settled for all time.

The good roads committee of the association had been in consultation with the promoters of the Lincoln Memorial Highway Association, and following its suggestion the executive committee practically endorsed the project and authorized moderate financial support.

After these matters had been disposed of, the meeting of the executive committee resolved itself into a sort of levee, audiences being granted in turn to representatives of two organizations and to promoters of a semi co-operative insurance project.

H. E. Coffin, Howard Marmon and G. M. Dickson, representing the Manufacturers Contest Association, appeared before the meeting and laid before it certain facts relative to changes to be made in the rules and the urgent necessity of financial assistance by the association and by manufacturers generally. No formal action was taken, the subject being referred to the N. A. A. M. contest committee for a recommendation.

R. P. Hooper, president of the American Automobile Association appeared to urge

support of the forthcoming Glidden tour and specifically to ask that the N. A. A. M. approve the recommendation of the Manufacturers Contest Association of the immediate adoption of the rule which will encourage and permit of the participation of private owners of unregistered cars in such contests. The N. A. A. M. proved agreeable to the suggestion and passed resolutions to that effect.

The promoters of the insurance project came from Philadelphia to explain the details of their enterprise, which includes the insurance of all cars at the time of their sale. They sought the endorsement of the N. A. A. M., but the wise heads of that body listened politely and then referred the matter to its conference committee.

The members of the executive committee present at the meeting were: W. E. Metzger, president; A. L. Pope, Alfred Reeves, Charles Clifton, L. H. Kittredge, H. O. Smith, Thomas Henderson, Benjamin Briscoe, W. T. White, J. W. Gilson, R. D. Chapin and S. A. Miles, general manager.

Canadian Promoters Seeking a Site.

C. M. Preston and E. C. Hill, of Toronto, who are said to have secured the Canadian rights to the Mercedes patents and other foreign rights, are seeking to obtain a site and financial support for several new companies, the organization of which they have in view. One of these is designed to be capitalized at \$1,000,000, and will be styled the Gaso-Electric Motor Co., Ltd. It will be operated in connection with the Canadian Time Test Tire Co., Ltd., in which Preston and Hill are interested also. These promoters visited Niagara Falls, Ont., on Thursday of last week and submitted a proposal to the city council which, however, took no action.

Wants \$100,000 for Non-delivery of Cars.

Suit against the American Motors Co. of Indianapolis for \$100,000 damages has been filed in the Federal court in that city by the Kopmeier Motor Car Co. of Milwaukee, Wis. It is alleged by the Milwaukee company that, under the terms of a sales contract, it deposited \$8,000 with the defendant and that the Indianapolis company refused to return the amount after it had violated the terms of the agreement. The contracts provided for the delivery of forty cars, but only twelve were sent in the specified time, according to the bill of complaint, and the plaintiff claims that it lost \$36,500 because of the failure to make deliveries.

Chance for American Accessories Abroad.

Val H. Muller and L. E. Phipps, who were respectively vice-president and treasurer of the New York export firm, Muller, McLean & Co., are making ready for an "export expedition" to the Far East on their own accounts, which will be undertaken early in December next, and which will occupy

some 18 months. Muller has made three similar journeys in the interests of his former firm and is thoroughly familiar with the ground and the conditions that prevail. On the forthcoming occasion, however, he will devote himself wholly to American automobiles and automobile accessories instead of mixing them with a great diversity of products, as heretofore. He already practically has selected the car he will represent but he is in the market for a number of desirable accessories, for which he is ready to pay cash in New York. Muller and Phipps will visit only the Asiatic countries—India, Burma, Ceylon, Java, Straits Settlement, China and Japan, all of which are promising markets.

To Build Factory for Spare Parts.

With a view of having constantly on hand ample stocks of spare parts for all of the many models ever produced by the several factories included in its organization, the United States Motor Co. is about to make the radical move of establishing a plant which will be devoted wholly to the production of such parts. The arrangements are well in hand, but despite reports to the contrary which have been circulating in the west the site for the factory has not yet been selected; officials of the company state that the plant will be erected unless unforeseen obstacles prevent and that it will be "centrally located," but more they will not say.

Three More Can't Sell Weed Grips.

On Tuesday last, 12th inst., Judge Hazel, sitting in the United States Circuit Court for the Western District of New York and Canandaigua, issued preliminary injunctions against the International Automobile League of Buffalo and A. C. Bidwell, its proprietor; Joseph Strauss & Son and Mathew Strauss, also of Buffalo, restraining them from selling or in any way having to do with the Weed chain tire grip. The injunctions were granted as the result of a proceeding instituted by the Weed Chain Tire Grip Co. alleging infringement of the Parsons patent.

S. A. E. Sets Date for Annual Meeting.

The Society of Automobile Engineers has set its annual meeting to occur in New York, January 18th to 20th, which dates are also the closing days of the commercial vehicle section of the Madison Square Garden show. In addition to electing officers, the Engineers will read and discuss papers of scientific interest and hear reports of their several standards committees.

Two Tire Chain Companies Consolidate.

The Fegley Tire Chain Co., of Philadelphia, and the Pearsall-Traver Mfg. Co., of New York, have been consolidated under the style the Reliance Tire Chain Co. The manufacture of tire chains will be continued in New York.

GENERAL MOTORS TRUCK POLICY

How Big Company's New Subsidiary Will Handle Commercial Cars—Old Nameplates That Will Disappear.

Truck selling on a rather unusual basis, contemplating a broadening and an advance over the more common systems, has been decided upon in connection with the marketing of the commercial vehicle products of the automobile manufacturing concerns in the list of the General Motors Co.'s subsidiaries. As was disclosed when the General Motors Truck Co. was created some months ago, the latter corporation is to undertake the selling of all the trucks made by subsidiaries of the General Motors Co., and by reason of the variety of types that the Truck company will have, it is possible to apply a selling policy that in many respects is unique.

W. J. Mead, who has the active direction of the General Motors Co.'s affairs, and H. S. Stebbins, manager of the General Motors Truck Co., have been working the plan out in detail for some time, and it is to have immediate application in connection with the New York headquarters that have been opened by the General Motors Truck Co. at 240 West Fifty-ninth street, on Columbus Circle, at Broadway.

No longer will the various trucks made by General Motors subsidiaries be featured by their factory names. They will all be known as General Motors trucks, and will bear a nameplate "G. M. C." accordingly. The factory name will only be used to describe the type, as the Reliance type, Buick type, Lansden type, etc. They will not be sold in competition with each other, but will be in united array as the General Motors Truck Co.'s offerings.

In treating with a prospective customer, the first effort will be to determine exactly what type or types of truck will best suit the requirements of his service. For this purpose a capable traffic engineer will make a study of the customer's traffic, and his report will govern the selling effort. It may be that he will find that the customer would best be served by two 1,500-pound high speed gasoline wagons, a two-ton gasoline truck and a three-ton electric truck. On his report to this effect the company will be prepared to furnish what is required. Situations sometimes arise where the customer diagnoses his own case and prescribes the wrong remedy. In such an event it will be the effort to show the customer that a heavier or a lighter truck would answer his purpose better, or that fewer of one type and more of another would meet the situation more perfectly. Other than to see that the customer in each case gets only the types that he needs, there is to be an impartiality as to what types the company sells, so that

the trucks will be sold to fit the customer rather than to make the customer fit the truck.

In the "service" end of the business, including repairs, replacements and adjustments, promptness is to be the ruling consideration. To this end a night force will be employed, so that there will be no such delay as commonly attends similar work on pleasure cars. Truck owners themselves have shown the importance they place on quick repairs and replacements, by buying extra wheels and extra parts for emergency use in connection with their vehicles. Their endeavors to minimize the periods of enforced idleness for their trucks, however, are to be exceeded by what the Truck company itself intends doing toward the same result.

Changes Among Prominent Tradesmen.

O. C. Curtis has been engaged by the Stevens-Duryea Co. as its Southern representative. Previously he traveled the same territory in the interests of the Franklin car.

Leslie B. Sanders has been appointed sales manager for the Lion Motor Car Co., of Adrian, Mich. Previously he was a district sales manager for the United States Motor Co.

J. W. McCrea, manager of the Hupp Corporation's Detroit store, has been transferred to the management of the corporation's branch in Los Angeles. S. B. Winn succeeds to the vacancy in Detroit.

A. M. Pearson has been appointed manager of the Franklin Automobile Co.'s branch in St. Louis. Formerly he was connected with the White branch in Boston and later with the Packard branch in Philadelphia.

P. W. Hood, former Western representative of the American Distributing Co., has been added to the sales staff of the Timken Detroit Axle Co. and the Timken Roller Bearing Co. He probably will operate in the Chicago district.

H. W. Moore, who previously was cashier of the Capitol National Bank, of Indianapolis, has been appointed assistant treasurer of the Mais Motor Truck Co., of that city. He will be located in the company's downtown office instead of at the factory.

Samuel B. Dusenberre, formerly connected with the United States Motor Co., has been appointed western sales manager for the New Departure Mfg. Co., of Bristol, Conn. He will make his headquarters at the Detroit office of the company in the Ford building.

Canadians Purchase Detroit Truck Plant.

The Superior Motor Car Co., of Detroit, of which L. N. Cooper was president, which manufactured commercial vehicles, has been sold to a party of Canadian investors. The entire plant and equipment will be removed to Petrolia, Ont., where the production of the trucks will be continued.

GARDEN SHOW SPACE APPORTIONED

Fifty-eight Board of Trade Members Secure Their Locations—Allotment Gives Comparative Line on Outputs.

Under the auspices of the Show Committee of the Automobile Board of Trade, Col. George Pope, Chairman; Alfred Reeves and L. M. Downs, the drawing for positions in the Madison Square Garden Show January was performed in the offices of that organization on the 6th inst., 58 members being allotted space. The distribution applied only to Part I of the show—that devoted to pleasure cars.

Apart from the mere apportionment of space, the Board of Trade allotment always is of more than surface interest because of the fact that the members draw for positions in the order of outputs, or rather the value of the cars which they have produced during the fiscal year ending June 30th, thus "giving a line" on their respective sales. The showing thus disclosed proved the standing of the first 25 members on this basis to be as follows: Buick, Overland, E-M-F, Cadillac, Packard, Maxwell, Pierce-Arrow, Chalmers, Hudson, Mitchell, Reo, Stoddard-Dayton, Oakland, White, Peerless, Locomobile, Oldsmobile, Stevens-Duryea, Winton, Pope-Hartford, Lozier, Franklin, Marmon, Stearns and Thomas.

While all of those entitled to space on the main floor exercised that privilege, there was no scramble to get spaces Nos. 1 and 2, which are located immediately within the entrance to the main hall of the Garden, several of those who could have secured them, passing them for more central locations.

The space numbers as finally allotted are as follows, the list after the first 23 exhibitors being substantially the order of drawing and production values:

Main Floor.

- | | |
|--------------------|-------------------|
| 1—Oldsmobile. | 13—Stevens-Duryea |
| 2—White. | 14—Buick. |
| 3—Stoddard-Dayton. | 15—Overland. |
| 4—Oakland. | 16—Cadillac. |
| 5—Pope-Hartford. | 17—Packard. |
| 6—Stearns. | 18—Maxwell. |
| 7—Lozier. | 19—Pierce-Arrow. |
| 8—Franklin. | 20—Hudson. |
| 9—Winton. | 21—Chalmers. |
| 10—Locomobile. | 22—Reo. |
| 11—Peerless. | 23—E-M-F. |
| 12—Mitchell. | |

Elevated Platform.

- | | |
|---------------|--------------|
| 101—Marmon. | 112—Brush. |
| 102—Thomas. | 113—Autocar. |
| 103—Alco. | 114—Haynes. |
| 104—Metzger. | 115—Lambert. |
| 105—Elmore. | 116—Pullman. |
| 106—American. | 117—Corbin. |

- | | |
|---------------|---------------|
| 107—Moline. | 118—Moon. |
| 108—Premier. | 119—National. |
| 109—Selden. | 120—Matheson. |
| 110—Columbia. | 121—Knox. |
| 111—Jackson. | |

Exhibition Hall.

- | | |
|-----------------|----------------|
| 50—Inter-State. | 53—Simplex. |
| 51—Amplex. | 54—Case. |
| 52—Mercer. | 55—Carter car. |

Balcony.

- | | |
|----------------|----------------------|
| 201—Garford. | 205—Palmer & Singer. |
| 202—Ohio. | 206—Daimler. |
| 203—Speedwell. | 207—Atlas. |
| 204—Marquette. | 208—McIntyre. |

Small Hope for Economy's Creditors.

According to reliable advices, the unsecured creditors of the Economy Motor Car Co., of Joliet, Ill., which went into the hands of a receiver on the 1st inst., will be fortunate if they realize 10 per cent. of their claims. C. E. Antram, who represents local financial interests, holds a \$12,000 mortgage, and a Joliet bank and two other local creditors and two outside ones also are secured. These amount to about \$25,000, leaving only about \$10,000 for the other creditors, out of which sum the expenses of the receivership must be borne. The liabilities approximate \$50,000. W. R. Everett, of Chicago, the president of the company, acquired control of it only last year and at once ousted the motor buggies which it had been building and set out to produce commercial vehicles. The change caused a financial stringency and Everett for months has been seeking to obtain an extension from his creditors; he says he thought he had about succeeded when the petition in bankruptcy was filed.

Tire Protector to Go to Akron.

William T. Dorgan, vice-president and general manager of the Standard Tire Protector Co., of Saginaw, has purchased the holdings of W. J. Wickes and A. D. Eddy, and has formed a new \$200,000 company under the laws of Ohio, to which state the plant will be removed. It will be located in Akron, where most of the stock is held.

Mitchell Incorporates Four Companies.

Under the laws of Wisconsin, the Mitchell Motor Car Co., of Racine, last week incorporated four branch companies to operate in as many different States. They are respectively the Mitchell Motor Co., of Philadelphia, of Atlanta, of Kansas City and of Seattle. Each is capitalized at \$10,000.

Chicago Branch for Colby Cars.

Pursuing its policy of expansion, the Colby Motor Co., of Mason City, Iowa, has opened a branch in Chicago at 2099 Michigan avenue, where floor space 25 x 150 feet has been obtained. The branch will be managed by W. H. Ogren, formerly of the Logan Auto Garage Co., of Chicago.

Bay City, Mich.—National Motor Truck Co., under Michigan laws, with \$300,000 capital; to manufacture commercial motor vehicles.

Stamford, Conn.—Schickel Motor Co., under Connecticut laws, with \$10,000 capital; to manufacture automobiles, motors, airships, etc.

Augusta, Ga.—Overland Motor Car Co., under Georgia laws, with \$10,000 capital; to deal in automobiles. Corporators—W. R. Eve, R. E. Carroll, J. H. Pronant.

Shawno, Wis.—The Frogner Auto Co., under Wisconsin laws, with \$5,000 capital; to deal in automobiles. Corporators—G. A. Frogner, E. M. Williams, C. E. Dunn.

Jersey City, N. J.—Oakland Motor Sales Co., under New Jersey laws, with \$10,000 capital; to deal in automobiles. Corporators—B. S. Mantz, J. R. Turner, H. A. Black.

Peoria, Ill.—Cadillac Automobile Co., of Peoria, under Illinois laws, with \$5,000 capital; to deal in automobiles. Corporators—Rollen Travis, Henry Naumann, H. H. Moody.

Chicago, Ill.—Ero Manufacturing Co., under Illinois laws, with \$2,400 capital; to deal in automobiles. Corporators—George A. Chrittenton, R. A. Raymojd, Ralph A. Schaefer.

Jersey City, N. J.—The Buick Co., under New Jersey laws, with \$10,000 capital; to deal in automobiles and motorcycles. Corporators—B. S. Mantz, L. H. Gunther, John R. Turner.

Milwaukee, Wis.—Motor Conveyance Co., under Wisconsin laws, with \$30,000 capital; to deal in motor vehicles. Corporators—J. W. Davis, C. F. Pullen, G. B. Louderback.

Boston, Mass.—Jackson Motor Car Co., under Massachusetts laws, with \$30,000 capital; to deal in automobiles. Corporators—Harold A. Matthews, Minot H. Bates, John L. Judd.

Dallas, Texas—Munger Automobile Co., under Texas laws, with \$5,000 capital; to do general automobile business. Corporators—S. T. Munger, Sr., S. T. Munger, Jr., S. R. Munger.

Vernon, Conn.—Buick Garage Co., under Connecticut laws, with \$3,000 capital; to operate a garage. Corporators—David B. Roberts, Thomas F. O'Loughlin, both of Hartford, Conn.

Detroit, Mich.—Motor Foundry Co., under Michigan laws, with \$35,000 capital; to manufacture gasoline motors. Corporators—John H. James, Joseph A. Geyman, Arthur Webster.

Boston, Mass.—Boston Commercial Co., under Massachusetts laws, with \$10,000 capital; to manufacture and deal in commercial vehicles. Corporators—L. H. Farnham, Ira M. Farnham.

Lima, Ohio.—The Lima Overland Co., under Ohio laws, with \$10,000 capital; to deal in automobiles. Corporators—Samuel Roeder, Howard P. Bears, George E. Bayley, George Roeder.

Chehalis, Wash.—Farnsworth Motor Co., under Washington laws, with \$25,000 capital; to manufacture and deal in motors and motor vehicles. Corporators—H. F. Farnsworth, Dick Balfour.

Evanston, Ill.—Evanston Motor Express Co., under Illinois laws, with \$2,500 capital; to do a general transfer business by motor wagons. Corporators—John G. Johnson, Michael F. Curtis, Earle F. Tilly.

La Grange, Ill.—Fifth Avenue Garage Co., under Illinois laws, with \$2,500 capital; to do general automobile business and conduct a garage. Corporators—R. Q. Jones, Clarence C. Collister, H. D. Howe.

Boston, Mass.—Boston Safety Crank Co., under Massachusetts laws, with \$50,000 capital; to manufacture starting cranks for automobiles. Corporators—Myer Berman, Walter M. Harding, Albert E. Rollin.

Canton, Mass.—Canton Garage Co., under Massachusetts laws, with \$10,000 capital; to maintain a garage and automobile livery service. Corporators—Benjamin F. Merritt, Frank W. Mansfield, Nathaniel N. Wentworth.

Montgomery, N. Y.—Security Reliner Co., under New York laws, with \$50,000 capital; to manufacture automobile tire liners and other automobile accessories. Corporators—Elmer I. Emerson, Grace A. Emerson, Orrin T. Barbe, all of Montgomery, N. Y.

Recent Losses by Fire.

Rochester, N. Y.—Rochester Taxicab Co.'s garage and seven automobiles damaged. Loss, \$10,000.

New York City, N. Y.—Richards Auto Supply Co., 1777 Broadway, store and contents burned. Loss, \$5,000.

Boston, Mass.—K. A. Skinner Co.'s garage, 179 Clarendon street, and 50 automobiles burned. Loss, over \$100,000.

Changes in Capitalization.

Owosso, Mich.—Owosso Motor Co., from \$200,000 to \$100,000.

Detroit, Mich.—Automobile Mfg. & Engineering Co., to \$50,000.

North Milwaukee, Wis.—Crown Commercial Car Co., from \$50,000 to \$100,000.

Change of Corporate Name.

Detroit, Mich.—Gulley-Walker Co., manufacturers of automobile parts, changes name to N. J. Walker Co.

George W. Creswell has "opened up" in Lancaster, Pa. He will handle the Cole "30" line.

Markee Manoogian is building a garage at 81 West street, Worcester, Mass. It will cost \$2,000.

W. W. Whitney, who maintains a garage in Lynn, Mass., has added a salesroom. He will sell Cole cars.

Julius Dusevoir, a Frenchman not very long in this country, has opened a garage at Centerville, California.

M. A. Bruder will erect a one-story brick garage at 1727-31 Snyder avenue, Philadelphia, Pa. It is to cost \$2,200.

Thomas Richter has opened salesrooms and a garage at 1112 Ludington street, Escanaba, Mich. He will sell Cole cars.

Frederick Bauernschmidt is building a garage at 939 E. Madison street, Baltimore, Md. It will be of iron, two stories high.

Ground has been broken for a three-story garage at the corner of Jackson and Marion streets, Tampa, Fla. Isaac Craft is the owner.

The Park Garage has been moved to new quarters at 18th street and Perkiomen avenue, Reading, Pa. The company handles the Cole "30" line.

The Logan Square Auto Co., of Chicago, Ill., which did a garage and delivery business, has changed its name to Illinois Braceville Coal Co.

J. H. Ebersole, of Washington, D. C., has opened a salesroom at 1521 Fourteenth street, in the national capital, where he will sell Stutz cars.

The Smith Implement Co., of Worthington, Mass., has added automobiles to its other interests and opened salesrooms. Cole cars will be handled.

James Friday has broken ground for a new garage at the corner of Fifth avenue and Elysian street, Pittsburgh, Pa. It will cost, when complete, \$2,500.

The Union Garage Co. is the style of a new concern which has established a garage and repair shop at Adrian, Mich. It is located in the Bijou building.

Thomas Black, of Winnipeg, Can., has been given the Canadian distributing agency for Universal motor trucks. He previously handled motor cars.

C. A. Howard, of Tracy, Cal., has opened salesrooms at Stockton, Cal., where he will display Marion cars. He has the distributing agency for San Joaquin county.

W. A. Grimm and R. W. Warner have formed a partnership and opened a garage

and salesrooms at 225 West Second street. They will handle the Krit and Imperial.

Northern Motors, Ltd., is the style of a concern which has "opened up" in Seaforth, Ont. It has the Canadian agency for Henry, Paige-Detroit and Marathon cars.

The General Motor Car Co., of 3952 Olive street, St. Louis, Mo., has taken the distributing agency for Cole cars. The concern will cover the whole state of Missouri.

At a cost of \$7,500 Horace F. McCann is erecting a garage at 6025 Germantown avenue, Philadelphia, Pa. It will be two stories high, of brick, and thoroughly fire-proof.

The United States Tire Co. has opened a branch in Los Angeles, Cal., under the management of John S. Wiese and Park Stair. It is located at 923 South Grand avenue.

Louis Davidson, of Philadelphia, Pa., has purchased a plot of ground 95 x 80 feet, at the northeast corner of 22nd street and Indiana avenue, on which to build a public garage.

Arthur Schultz has been elected vice-president of the Western Motor Car Co., Chicago agents for Stearns cars. He succeeds his brother-in-law, the late Harry M. Burnell.

Mayor T. L. Craig, of Castonia, S. C., is going into the automobile business. He is building a brick garage, 100 x 30 feet, at the corner of North Marietta street and Long avenue.

The Frank R. Parker Co., dealer in automobiles at 243 Columbus avenue, Boston, Mass., has made an assignment for the benefit of creditors to Alexander Kendall. The company is said to be insolvent.

The Tire Service Co. has been formed at Los Angeles, Cal., and is located at 620 South Spring street; it is under the management of E. Richard Just, who previously was connected with the Morgan & Wright branch.

Baker & Wainwright, who conduct a garage and automobile stage line at Winters, Cal., have purchased the garage of D. O. Judy in the same town. They are establishing therein a repair shop and storage department.

The Overland Co. of Lima, which was incorporated last week under Ohio laws, with a capital stock of \$10,000, has opened salesrooms in Lima, Ohio, at 206 East Market street. Elwood Lindesmith is the manager of the concern, which will handle Overland cars.

Under the style the Paxton-Crumley Co.,

a new concern has "opened up" at the corner of Broad and North streets, Philadelphia, Pa. Warren-Detroit cars will be handled exclusively. Harry Paxton and A. A. Crumley are the men behind the enterprise.

The Twin City Motor Transit Co. has been incorporated under South Dakota laws, with \$150,000, to inaugurate a passenger motor vehicle service between Minneapolis and St. Paul. Guy H. Perry and C. F. McMullen are the men behind the scheme.

The White Motors Co., of which W. A. Rutz is general manager, has taken possession of salesrooms at 1094 Chapel street, New Haven, Conn. The company formerly was located at 666 State street, in the same city, where it displayed White pleasure and commercial cars.

Charles U. Kierstead has purchased the automobile repair business of J. J. Butler, at 1100 Main street, Hartford, Conn. He will do business under the style the City Auto Repair Co. of Hartford, which he has incorporated with \$1,000 capital and with himself as president.

Charles A. Duerr, one of the real veterans of the industry, and P. A. Proal have formed the Morgan Sales Co., and will handle the Morgan truck in New York City. They will make their headquarters at 59th street and 10th avenue, with the Motor Car Repair Co., of which Proal is president.

The Chicago Motor Car Co., which represented Packard cars in the Windy City, has been purchased by the Packard company itself, and will be continued under the style Packard Motor Car Co. of Chicago. H. M. Allison, of the old company, will remain in charge of the branch as general manager.

A. J. Picard, one of the earliest workers in the automobile vineyard, and one of the best known in this part of the country, has formed the firm of A. J. Picard & Co., which, on the 22nd inst., will open an automobile supply establishment at 1720-22 Broadway, New York. Edward S. Morrison, a newcomer, constitutes the "Co."

Harry N. Baetjer and G. Ridgely Sappington have been appointed receivers for the Pullman-Schaffer Motor Car Co., Baltimore agents for Pullman automobiles, following the filing of a petition in involuntary bankruptcy by four local creditors. The assets of the company amount to \$11,000 and the liabilities, \$15,000. The company's place of business is at 408-410 North Calvert street.

The Haynes for 1912 Offers the Dealer a Splendid Line

Haynes Model 21, 40 h. p., $4\frac{1}{2} \times 5\frac{1}{2}$ Motor, 120 inch Wheel Base, \$2,100

The response of public and trade alike to our announcement of the 1912 Haynes models has been beyond all expectations.

Within twenty-four hours after the firing of our first big gun for 1912—the full page announcement in Saturday Evening Post, Collier's, Everybody's, McClure's, Munsey's, and other big publications—dealers in all parts of the country had wired in orders for demonstrating cars and the mails were bringing us bundles—literally bundles—of letters calling for the Haynes 1912 catalog.

Then when our announcement to the trade appeared in this and other publications the activity among dealers reached a point which we had not anticipated at all.

Just stop a minute to think what this means. The fire which completely destroyed our old factory last February practically put the Haynes car out of the market for seven months. In temporary shops we had been able, during that period, to make very few cars—not one-tenth enough cars to fill orders booked **before** the fire. And during those same months, other manufacturers were going to the public and to the trade day after day, month in and month out, with their advertising, with their salesmen, and with their announcements of new models while **we** were at a standstill.

Last month when our magnificent new factory had risen from the ashes of our old one, when its wonderful modern equipment had been installed and our first 1912 model had been built and tested and **proven** to be the **best** of all the splendid Haynes models ever built, **then** we came back into the market. It was a glorious return, and a royal welcome.

We hadn't realized it but the public was **waiting** for the new Haynes.

The 1912 Haynes—two chasses—Model 21, 40 h. p., $4\frac{1}{2} \times 5\frac{1}{2}$ motor, 120 inch wheel base, and Model Y, 50-60 h. p., $5 \times 5\frac{1}{2}$ motor, 127 $\frac{1}{2}$ inch wheel base—with eight types of body selling at \$2,100 to \$3,900—is truly a superb, high power car, and built into it are **eighteen years** of Haynes experience and skill.

There is a LIVE DEMAND for Haynes quality of design and construction at Haynes prices and Haynes dealers will supply this demand. Our first 1912 demonstrators are leaving the factory this week. Write us today, or wire, and if we can take care of you on an agency connection we will advise you at once. Address,

HAYNES AUTOMOBILE COMPANY, Dept. U, Kokomo, Ind.

NEW YORK, SEPTEMBER 14, 1911.

Arousing the Spirit of Amateurism.

So far as concerns the pastime, it is one of the happiest auguries of recent times that the Motor Contest Association and the National Association of Automobile Manufacturers should join in recommending the immediate application of the rule affecting privately owned cars which will render the Glidden tour and other similar contests more attractive to amateurs and private owners generally. The recognition and frank avowal that private owners are desirable and necessary to the success of such forms of competition is additional indication of the light that is breaking through, and that, it is to be hoped, marks the dawn of an era of real sport, unclouded by suggestion of commercialism.

As is apparent, and as the Motor World so often has pointed out, the permanence of any sport rests on amateurism, and automobiling is no exception to the rule. With the rules rendered more flexible and

inviting, promoters now should do their part to encourage the amateur. There should be special classes and special tro-

corded it; he should not be snuffed out in either entry blanks or programs.

Light That Does Not Illuminate.

Now that the better regulated communities have frowned on the use of glaring headlights within city precincts the lighting problem, in a way of speaking, may be said to be less in the public eye than it was a year or two ago. Motorists returning from vacations spent more or less on the road, however, are pretty generally alive to the fact that the headlight problem constantly is becoming a more vital factor in regulating the safety of the wayfarer by night.

As the number of cars on the road at night increases, as the depravity of the reckless driver continues to hold unabated sway, and as automobile traffic penetrates further into unknown and uncultivated regions, the amount of dependence which must be placed on the lighting system necessarily becomes greater. Whence it may be observed that less attention than formerly now is being paid to properly focusing the headlights. Despite the advantages of adjustable brackets, devices for varying the focus of electric lights and even sundry methods of causing the headlights to swing with the front wheels and so illuminate the course immediately to be traversed, it is a fact that a large percentage of the cars encountered in the paths of darkness are equipped with inadequate lighting. Frequently the result is more bewildering to drivers of opposing traffic than illuminating to the driver whom it is supposed to benefit. Cars with headlights which present a "cross-eyed" effect, or which shed more light on the tree tops than on the road, divide honors with those which are fitted with equipment which is directed to one side or too low to be of real service to the driver.

As far as the optical problem goes, there are two distinct theories to be considered. One has it that both headlights should be directed to a common focal point in the center of the car's direction and should have sufficient range only to illuminate a spot within easy distinguishing distance of a driver with normal vision. The other theory is that one of the headlights should be directed to the point of maximum easy vision, while the other is brought to bear on the road immediately in front of the car. Both long and short range adjustments have their advantages under differ-

ANNOUNCEMENT.

The Motor World Publishing Co., Joseph Goodman, president, announces the sale and transfer of its capital stock, assets and goodwill to Mr. A. B. Swetland and his associates, the transfer bearing date as of September 1st. Mr. Swetland has spent the greater part of his life in the publishing business and as he long has been identified with the automobile trade he requires no introduction. The impress he has made speaks for itself. In expressing appreciation of the support that has been accorded them during the past eleven years, the retiring owners of the Motor World bespeak for their successors that full measure of confidence and patronage of which they are in every way worthy.

In assuming the responsibility of unrestricted ownership and management of the Motor World, we will continue its present purpose and scope—"A trade paper giving the world's motor news." Long established, as time can be measured in a relatively new industry, its volumes now contain the most complete record extant of the unprecedented industrial and financial development of the trade and its outgrowths. We believe the future holds still greater achievement, which will be recorded in these pages as automobile history is made—completely, concisely, truthfully and promptly. And the aim of our editorial and business policy will be competent service and the square deal for everyone under every conceivable and self-respecting circumstance and condition; being absolutely unfettered and with our interests bound wholly and solely in the Motor World we will leave nothing undone to serve those purposes.

MOTOR WORLD PUBLISHING CO.,
A. B. Swetland, President.

phies for private owners, and every effort should be made to inject the element of human interest into every form of competition. The man is entitled to as much credit as the machine and should be ac-

ent conditions, while the compromise effect, otherwise satisfactory, falls short of the mark through failing to provide maximum intensity of illumination at either point.

An ideal system would be one in which the headlights were constrained to follow the direction of the steering gear and which also provided means for altering the range to suit speed and road conditions—long range adjustments being best for high speeds on good roads and short range for heavy running conditions. What is more to the point, however, is that motorists the country over should be impressed with the need of maintaining the proper alignment of lamp brackets and of avoiding adjustments which tend to cast a blinding light in the faces of approaching drivers. Such a precaution may be one of the "courtesies of the road" that have to be enforced by legal means.

Overcoming the Idle Motor Truck.

In considering commercial vehicle operation problems cost estimates usually are predicted on maximum service with the understanding that the more nearly continuous the service requirements—up to the point of overload—the greater will be the economy. Apparently this discounts the utility of the motor truck to the operator whose need of transportation is intermittent or only occasional. It is true that as compared with horses, automobiles do not "eat their heads off" while standing in the stall, but the fact remains that the automobile investment is sufficiently heavy to render it a questionable plan to allow it to remain idle.

There is no particular reason why a business should be deprived of the certainty and convenience of motor haulage merely because its requirement is not continuous. Hence such a case is worth investigating. Obviously two courses are open. One is to hire vehicles to perform the service when required; this solution taking it for granted that suitable service is obtainable and at a moderate figure. The plan is applicable in several ways and were it wholly feasible would set at rest all doubts. The only trouble is that it seldom is feasible. In the rare cases where adequate truck service is to be had on a rental basis it usually happens that the cost is high. The liveryman must protect himself against the very idle periods which the business man is seeking to avoid and he must have his own profit above expenses.

The second alternative is to purchase and hold a sufficient equipment to meet the maximum of service conditions, laying up such portion of it as is not needed during slack periods. The question then arises as to the actual cost of trucks when idle. To make it profitable to own, rather than to hire the rush period equipment, other things being equal, the cost of operating the extra equipment when in use, plus its cost while idle, must fall inside the cost of hire for similar service obtained. Broadly speaking, the storage cost of the equipment must be balanced against the profit of the professional operator or liveryman.

Circumstances govern cases, and in most instances it is probable that local, rather than general conditions, will provide for the balance of advantage one way or the

other. A point to be considered in this connection is brought out in another column by Robert McA. Lloyd in discussing the motor moving van. Owing to its mechanical simplicity the electric truck suffers less deterioration, costs less to "cut in" and "cut out," figuratively speaking, and therefore is cheaper when idle than the gasoline truck.

Safe to say the problem involved is one of present-day expedient rather than perpetual burden. In due season motor haulage will adjust itself to a normal state. Then, doubtless, a sufficient demand for contract haulage will develop to encourage considerable investments in rolling stock devoted to that purpose and likewise sufficient competition to force rates down to an equitable level.

HERR THE LION AT PORT JEFFERSON

National Driver Bags Four Events at Long Island Hill Climb—Threatening Weather Mars Lengthy Program

"Hill climbs are slow," disgustedly remarked one of the spectators of the Port Jefferson affair, after watching all sorts of

wire, but after a tremendous bump, in which all four wheels of his car went clear of the road, he straightened out and persons commenced to breathe again. The performance of Hughes in his little yellow Mercer was deceptive; he did not seem to go very fast as he scarcely skidded an inch, but that he did "make time" was evidenced by the timing apparatus. He came dangerously near Herr in the class for cars cost-

of oil had been spilled and the road was hard and practically dustless except at the top of the grade, where a shortage of oil and a plenitude of small stones was apparent. As a result, the timers and judges and other officials, who occupied a tiny stand, soon acquired a generous coating of Long Island real estate.

The crowd which turned out was a slim one. At both the start and finish lines there was a semblance of a crowd, though all along the course it was not necessary for spectators to crane their necks to look over persons in front of them. A very thin line on either side of the road constituted the crowd. A fair proportion of it was made up of ladies and children and the gathering of natives and yachtsmen from visiting craft far outnumbered the motoring contingent that was present. Perhaps the threatening weather had something to do with the shortage of motorists, but anyway very little enthusiasm was apparent, not a few of those who had foregathered leaving long before the curtain was rung down.

The first car got over the starting line a little after 1:30, and from then until after five o'clock cars continued to climb, each driver being permitted two trials at the hill, and though the best time in the two trials governed, not a few of the contestants failed to better their first efforts when they went up later. All starts were rolling, or rather flying, the cars starting about an

DON HERR (NATIONAL) WINNING THE FREE-FOR-ALL

cars snort their way up the 2,000 foot incline in the Long Island village on Saturday last, 9th inst. Which, taken literally, is not absolutely true—part of the program, at least, was productive of speed, though by far the greater part of it was not. Colloquially, the affair surely was "slow," which is to say, that there was little excitement, the spectacle of a single car on the course at a time scarcely causing an increased heart-throb.

The pilots who furnished the really fast driving and the only thrills of the day may be counted on the fingers of one hand. Of the five, Don Herr, who but recently made his debut at the wheel of a National, was the bright particular star. He was entered in four events and he won them all, including the big event of the day, the free-for-all. This he carried off in 21.31 seconds, which was the fastest time recorded during the meet.

Louis Disbrow, with his old familiar Pope "Hummer," also drove fast—so fast that every time it was announced that he had started, the spectators rushed back from the side lines, for they remembered his sensational work last year. The two Knox hill climb artists, Coffey and Belcher, likewise caused a general scattering of on-lookers, and incidentally of dust, for nearly every time Coffey came up he skidded over the timing wire and broke it. Once he nearly ran into a knot of standees at the

F. S. APGAR (LION) IN SIGHT OF THE SUMMIT

ing between \$2,001 and \$3,000, and of course he won his piston displacement class—he almost invariably does so.

It was the second annual hill climb which the Automobile Club of Port Jefferson has promoted, and the course over which it was run was in well nigh perfect condition. The slant is 2,000 feet in length and the gradient varies from 6 to 16 per cent. Lots

eighth of a mile from the line and almost in the heart of the village.

The light cars were sent away first, and though some of them care perilously near to "dying" on the steep grade, they all got up without trouble, and their performances, though slow in comparison with the fast time which subsequently was made, nevertheless were creditable in view of the hard

F. W. BELCHER (KNOX) AND A DOWN HILL VIEW

climb and the small motors. Walter Blair (Ford) accounted for the class for touring cars costing less than \$800, with Phillip Walters, also in a Ford, second. Later, Blair came back and was second to Clifford Bishop (Ford) in the next largest class for cars costing between \$800 and \$1,200. F. S. Apgar had no particular trouble in winning the \$1,201-\$1,600 division with his Lion, and repeated his victory in the 161-230 inches piston displacement class. H. B. Tucker (Corbin) was first in the division for cars costing from \$1,601 to \$2,000, with Walter Blair, this time in a Cole "30," second.

It was in the next larger price division class—\$2,001-\$3,000—that Herr started his winning streak. Hughes in his Mercer was the only other starter in this event, and he was only a little more than a second behind Herr. In the free-for-all which followed Fred. Belcher (Knox) was only beaten by the Herr-National combination by the scant margin of 26/100 of a second, while Louis Disbrow, who was third, was very nearly two seconds slower. Thereafter, Herr won both the 301-450 and the 451-600 inches classes by comfortable margins, Disbrow somewhat retrieving himself by running second in the former event, while Belcher and Coffey, both in Knox cars, were second and third, respectively, in the larger class. The summary:

Gasolene stock cars, \$800 and under.

Driver and Car	Time
Walter Blair, Ford	44.88
Phillip Walters, Ford	48.83
Rudolph Wehr, Krit	1:37.47

Gasolene stock cars, \$801-\$1,200.

Clifford Bishop, Ford	43.06
Walter Blair, Ford	46.61
J. Craig, Paige-Detroit	48.71

Gasolene stock cars, \$1,201-\$1,600.

F. S. Apgar, Lion	29.22
J. Taylor, Correja	33.95

Gasolene stock cars, \$1,601-\$2,000.

H. B. Tucker, Corbin	32.90
Walter Blair, Cole "30"	43.55
A. M. Campbell, Velie	46.24
J. Craig, Colby	47.98

Gasolene stock cars, \$2,001-\$3,000.

HUGHIE HUGHES (MERCER) WHIZZING TO VICTORY

PORT JEFFERSONIANS WELCOMING THE HILL CLIMBERS

AT THE TAKE-OFF OF THE PORT JEFFERSON CLIMB

BAUER BEST IN BUFFALO CONTEST

**His the Only Clean Road Score and None
Surmounts Technical Test—Four Days
of Grueling Going.**

After four days of travel over the poorest roads that could be found in Western New York, Howard A. Bauer, at the wheel

In those for touring cars \$1,201—\$1,600, a dispute arose over a technical point regarding two Maxwell cars. Three contenders finished the road tests in this class. They were E. G. Gager, Maxwell, who was penalized 39 points; J. W. Gardham, Everitt, 57 points, and Thomas Costello, Maxwell, 106 points. In the technical examination a dispute arose and the committee took the matter under consideration and up to yes-

to conspire to make them worse. Recent rains had made the ground soft and the mud in many places reached the hub caps of the machines. There were many hills, too, some of which make the national hill climbing grades look like pimples. Some of the roads were like the rocky bottoms of creeks and in many cases streams were encountered that brought the water to the cylinders of the motors. It had been expected that there would be at least 30 starters, but a study of the itinerary caused half of them to withdraw at the last moment. Of the 15 who started only eight finished.

Boliver was the noon control of the first day and promptly at 6:30 Wednesday morning Pilot D. H. Lewis, driving an E-M-F, blazed the way in that direction. He was followed by A. W. Kreinheder, referee and pacemaker, in a Pierce-Arrow; Chairman Augustus Knoll, in a Thomas "six," and the representatives of the press in a 1912 six-cylinder Cole, driven by E. A. Green, Buffalo agent for the Cole. The contestants came next at minute intervals as follows: C. F. Monroe, Maxwell; E. G. Gager, Maxwell; B. W. Scott, Flanders; T. R. Bell, Flanders; H. L. Blomstrom, Lion; J. W. Gardham, Everitt; G. M. Herron, Flanders; Thomas Costello, Maxwell; E. W. and C. H. Werick, Schacht; E. A. Blaney, Ohio; N. Wilkinson and L. J. Kinitz, Ford; G. Morton Wolfe, Ford; Howard A. Bauer, Oakland; J. D. Mohrhardt, Warren-Detroit; J. E. McFadden, Paige-Detroit; Frank H. Denny, Abbott-

BAUER (OAKLAND) ENOS TROPHY WINNER

of an Oakland, was the only one of 15 contestants in the second annual reliability tour of the Automobile Club of Buffalo, 6th to 9th inst., to complete the 800 miles with a perfect score. However, after the technical committee finished its rigid examination even Bauer's record was slightly soiled, but not sufficiently to keep him from securing the most coveted honor, the Enos trophy. When the technical tests were over, Bauer had been debited eight points. His nearest competitor was T. R. Bell, driver of a Flanders, who was penalized 16 points by the technical committee in addition to 38 he had lost on the road. Bauer therefore was awarded the Laurens Enos trophy, which has been held during the past year by Charles F. Munroe. The trophy was offered by Laurens Enos, president of the Buffalo Club, and is to be won three times before it becomes the permanent property of the holder.

In addition to the Enos trophy, which was the free-for-all award, there also were offered prizes to the class winners, and here again Bauer won, taking the prize in his class, the runabout division for cars costing \$1,200—\$1,600. The other class winners were the following: Runabouts, \$800 and under, T. R. Bell, Flanders; touring cars, \$2,001—\$3,000, H. L. Blomstrom, Lion.

No awards were made in the other classes.

COLE PRESS CAR ON THE PITCH OF BUFFALO HILL

terday (Wednesday) afternoon, no decision had been reached.

Buffalo was the starting and finishing point of each day's run, the route being through different territory. It was a real reliability contest, the roads traversed were not only generally bad, but nature seemed

Detroit; C. A. Almendinger, Hupmobile; James Noonan, Pierce-Arrow, and M. R. McCullough, Thomas "six." The last four, however, were non-contestants.

The route was through Warsaw and Wellsville and because of road conditions many things happened. Penalties were in-

MCFADDEN (PAIGE) AT A WILD SPOT NEAR CASTILE

ON BOSTON HILL, ONE OF THE SOUL-TRYING GRADES

afflicted only for mechanical trouble, leaving the cars free to make any speed they desired without penalty, although running schedules for each class were as follows: Cars selling at \$800 and under, 16 miles per hour; \$800 to \$1,600, 18 miles, and over \$1,601, 20 miles. This was not followed closely the first day on account of the mud, although the 200 miles was covered in less than 16 hours by nearly all the cars. Just before reaching Bolivar, Charles F. Monroe, Maxwell, who won the trophy last year, and was defending it, was the victim of an unfortunate accident which put him out of the contest. He had stopped to let a farmer's team pass when a non-contesting car came along. Monroe signaled this car to stop, but its driver did not see the signal and crashed into the rear end of Monroe's Maxwell. A few minutes later E. W. and C. H. Werick (Schacht), followed, and in an effort to get out of the way their car skidded into Monroe's car, adding further damage and putting their own out of commission. Both automobiles returned to Buffalo and were withdrawn from the contest. The return from Bolivar was by way of Olean. Various difficulties were encountered and when the cars checked in at Buffalo, but four had clean scores. The day's penalties were, T. R. Bell, Flanders, 3; B. W. Scott, Flanders, 3; L. Blomstrom, Lion, 11; E. G. Gager, Maxwell, 18; N. Wilkinson and L. J. Kinitz, Ford, 19; J. W. Gardham, Everitt, 27; Thomas Costello, Maxwell, 46; E. A. Blaney, Ohio, 96; J. E. McFadden, Paige-Detroit, 634.

Dansville was the turning point of Thursday's run. The roads were not quite as bad as those of the preceding day. However, it was no joy ride or pleasure trip. Several bad hills were encountered and some rough winding roads. Mud also was very much in evidence, and when all cars checked in at Buffalo after finishing the 200 miles but two clean scores remained. They were, Howard A. Bauer, Oakland, and C. Morton Wolfe, Ford. The day's penalties were, J. S. Mohrhardt, Warren-Detroit, 1; E. A. Blaney, Ohio, 3; J. W. Gardham, Everitt, 4; G. M. Herron, Flanders, 4; N. Wilkinson and L. J. Kinitz, Ford, 5; H. L. Blomstrom, Lion, 8; E. G. Gager, Maxwell, 14; Thomas Costello, Maxwell, 58; J. E. McFadden, Paige-Detroit, 291.

Although the run on Friday was a trifle more than 200 miles, the going was somewhat better than that of the preceding days. It took the contestants through Bedford, Warren and Jamestown. However, in order to keep within schedule time many of the smaller cars were compelled to maintain a pace of at least 25 miles an hour. C. Morton Wolfe, Ford, who up to this time held a perfect score, lost five points, while at the same time J. E. McFadden, Paige-Detroit, who had trouble each day, after being assessed 318 points, withdrew. The grind was also more than G. M. Herron, Flanders, and B. W. Scott, Flanders, cared to continue, and although

they covered the day's run without serious mishap, they also withdrew. This left but eight cars for the last day's run. The penalties for the day were, Thomas Costello, Maxwell, 2; E. G. Gager, Maxwell, 3; J. S. Mohrhardt, Warren-Detroit, 3; C. Morton Wolfe, 5; Wilkinson and L. J. Kinitz, 9; J. E. McFadden, Paige-Detroit, 318; E. A. Blaney, Ohio, 14; J. W. Gardham, Everitt, 230.

Sliding up and down mud banks and negotiating streams was part of Saturday's proceedings in order to reach North Java and return. The route was through Springfield, Batavia, Albion and Perkin, and the roads were worse than those encountered on the first day. In selecting the course Pilot Lewis determined to make it as severe as possible and well succeeded. Credit, however, is not only due to the cars, but to the drivers for only by extreme care serious accidents were avoided. When the last of the eight cars making this final trip checked in at Buffalo, but two—Bauer, Oakland, and Costello, Maxwell, had clean scores for the day and Bauer alone survived the four days without a penalty.

The day's penalties were: J. S. Mohrhardt, Warren-Detroit, 3; J. W. Gardham, Everitt, 3; E. G. Gager, Maxwell, 4; N. Wilkinson and L. J. Kinitz, Ford, 19; T. R. Bell, Flanders, 35; C. M. Wolfe, Ford, 43.

Frank H. Denny, Abbott-Detroit, who was a non-contestant, dropped out on the last day, but the other non-contestants made the entire trip and are credited with perfect road scores. The accompanying table gives the scores in detail.

Fastest Climbers Lose at Sioux City.

Entering stock chassis in stock car contests, which is contrary to the rules of the A. A. A., caused some disagreement at the hill climb promoted by the Sioux City Automobile Club, Saturday, 2nd inst. It was the first hill climb to be held in that Iowa city, which may account for the trouble. The course was less than a mile long. The best time was credited to two Moon cars, entered by the Bennett Co., which negotiated the grade in 37¾ and 38 seconds, but as they were stripped chassis of the roadster and touring car class, they were disqualified and the officials refused to accept the performances except as exhibitions. The summary:

Roadsters, \$801-\$1,200—Won by Bert Smith, Ford; second, Ford (Warnock Co.); third, E. L. Adams, Cartercar. Time, 0:45.

Touring cars, \$1,201-\$1,600—C. A. Kneeder, Buick, and Moon (Bennett Co.), tied for first; second, F. T. Leeder, Reo, and W. A. Retz, Buick (tied). Time, 0:51.

Roadsters, \$1,601-\$2,000—Won by Bert Smith, Ford; second, Ford (Warnock Co.). Time, 0:46¾.

Trial for the hill record—Moon (Bennett Co.). Time, 0:37¾. Disqualified as it was a stock chassis and not a stock car.

Touring cars, \$1,600-\$2,000—Won by Buick (Nebraska Buick Co.); second, F. T. Leeder, Reo. Time, 0:49¾.

Touring cars, 301-450 inches displacement—Won by Buick (Nebraska Buick Co.); second, W. A. Reetz, Buick. Time, 0:49¾.

Roadsters, 301-450 inches displacement—Won by O'Connell, Velie. Time, 0:53¾. Moon (Bennett Co.) was first in 0:38, but was disqualified for being out of its class.

Free-for-all—Won by H. A. Wetmore, Chalmers; second, B. Smith, Ford. Time, 0:47.

Free-for-all, touring cars—Won by Buick (Nebraska Buick Co.); second, W. A. Reetz, Buick; third, Thomas, Inter-State. Time, 0:47¾.

Free-for-all, roadsters—Won by O'Connell, Velie; second, Ford (Warnock Co.). Time, 0:50¾.

Cooper "Cleans Up" at San Jose.

Earl Cooper, at the wheel of a Maxwell, carried off the honors at the speed carnival held at San Jose (Cal.) Driving Park, Sunday, 3rd inst. The track was in good condition and over 5,000 spectators witnessed the performance. Cooper lost but one of the four races given. This was when he forsook his Maxwell for a big Pennsylvania "six" and in a special match met Frank Free, driving an eight-cylinder 70 horsepower "Comet." In all the other races he had a clean-cut victory.

The 15 miles free-for-all race proved a battle royal between Cooper, Maxwell, and Free, Comet, after the fourth mile. Free was away at the drop of the flag and Cooper had a bad start. At the first mile he was last but on the next lap passed his brother, Ray Cooper, Pennsylvania, and during the third mile overtook F. J. O'Brien, Ford. At the end of the fourth mile Cooper nosed his car in front of Free, and for the next ten miles the cars were side by side. During the last mile the Comet suddenly began to miss and Cooper shot the Maxwell ahead and crossed the line with a safe lead.

The summary:

Ten miles, stock chassis, 300 cubic inches and under—Won by Earl Cooper, Maxwell; second, Al Marino, Buick; third, F. J. O'Brien, Ford. Time, 11:29¾.

Five miles match, Earl Cooper, Pennsylvania, vs. Frank Free, Comet—Won by Free. Time, 5:20¾.

Ten miles, handicap—Won by Earl Cooper, Maxwell (30 seconds); second, Frank Free, Comet (scratch); third, F. J. O'Brien, Ford (40 seconds). Time, 10:24.

Fifteen miles, free-for-all—Won by Earl Cooper, Maxwell; second, Frank Free, Comet; third, Ray Cooper, Pennsylvania. Time, 16:41.

Philadelphia Racemeet Postponed.

The bad condition of Point Breeze track, combined with a lack of entries, caused the Philadelphia Automobile Trades Association to postpone the racemeet announced for the 7th and 8th inst. And when it is run, on the 23rd inst, it will be only a one day affair.

CINCINNATI TAKES LONG CHANCES

**Two Strenuous Road Races Decided on
Dangerous Course—Three Spills—Jen-
kins and Hearne the Victors.**

Over a sadly neglected course and under conditions that were anything but encouraging, Eddie Hearne, driving a Fiat, and Johnny Jenkins, in a Cole, won the two road races—one at 197.5 miles for cars under 600 inches displacement, and the other at 150 miles for cars under 300 inches displacement—with which the celebration over the Fernbank dam in the Ohio river at Cincinnati was brought to a close on Saturday last, 9th inst. Hearne's time for the longer event was 3:29:03, which is at the rate of 56.7 miles an hour, while Jenkins covered the shorter route at the rate of 54.5 miles an hour in 2:46:29.

According to the entry blanks three events originally were carded, a race at 180 miles for cars in the 301-450-inch class being sandwiched in between the other two, the longer of which also was different as first announced being scheduled to go 250 miles. But the course was in such vile condition, due to continued rain, and the roads were far from smooth even when dry, that 52½ miles, or seven laps of the 7.9 miles course, were lopped off the long race just prior to the start. As for the intermediate event, that was abandoned long before because of lack of entries and up to within a few days of the start it looked very much as if the other would share its fate. C. E. Stuart, of the Indianapolis Speedway, who had arrangements under his wing, scurried around, however, the result being that by Saturday morning a fair representation was on hand.

For the two races the entries were the same except that for the longer event the list was augmented by the addition of Eddie Hearne (Fiat), Harry Knight (Westcott) and Gil Anderson (Stutz). The other entries were as follows: Montague Roberts, Abbott-Detroit; Rupert Jeffkins, Schacht; Johnny Jenkins, Cole; Harry Matthews, Ohio; William Thatcher, Ohio; J. K. Gilchrist, Cino; Andy Burke, Cino; John Raimsey, Cino; W. H. Pearce, Colby.

But even though the entry lists were fairly well filled there came very near not being any races after all; militiamen who were supposed to be on hand and in their places before 10 o'clock failed to put in appearance until the last minute and it almost had been decided to call the whole affair off. Eventually they did show up, though nearly an hour late, and the start, which was scheduled for 11 o'clock, did not take place till nearly noon. The so-called guards might just as well have stayed away altogether for all the good they did, however, spectators roamed at will over the course and the "soldiering" that

was exhibited by the guards was a caution.

Other arrangements, too, were such that spectators who had paid real money for seats in the improvised grandstand were left in anything but amiable tempers. No covering to the stand was provided and as a result patrons simply sweltered. Add to which the stand was situated so that a railroad track was between it and the course and that trains continually were passing, slowly, to allow passengers to see as much of the race as possible, and the excuse for ill humor and criticism becomes apparent. Parking spaces were provided for automobiles, but as no one was on hand to direct drivers, many of whom mired their cars in the sticky mud, discomfort was increased. In spite of the disadvantages, however, there was a really big crowd on hand, the estimated attendance being in the neighborhood of 20,000.

As has been done on several other occasions, both races were run at once, all the cars being started at one minute intervals. In the preliminary examination before the start it was discovered that the seats on Roberts's Abbott-Detroit were arranged tandem fashion instead of side by side as is the usual custom. Judging that the arrangement was unsafe, F. E. Edwards of the Technical Committee of the American Automobile Association, disqualified the car and as Anderson's Stutz had slipped into a mud-hole and could not be extricated in time but ten cars came to the line.

In the first part of the race accidents came thick and fast and before the slippery grind was one-third over the field had been thinned from ten to seven. John Raimsey, pilot of one of the native built Cinos, was the first to have trouble, a blown out tire causing a skid in which the car was overturned and placed hors de combat. Pearce's Colby also suffered ill-luck on the first round, a broken wheel causing the withdrawal of the car. Beyond minor cuts and bruises, no one was hurt. One of the other Cinos, driven by Burke, was put out of the running in the fifth lap by a broken steering gear.

For the first round, Jeffkins kept his Schacht in the lead with the two Ohio cars, driven by Thatcher and Matthews, next, and Burke (Cino) close behind. Hearne in his big Fiat and Jenkins with his Cole, the eventual winners, took things easy until the third lap, when Hearne went to the front with Jenkins close behind him, and they stayed in those positions till the 19th lap, when Jenkins passed Hearne and led for a single lap. Hearne soon caught up, however, and from then to the finish of the 25 laps he led the field.

But six cars passed the finish line, the Ohio car driven by Thatcher having been withdrawn in the 20th lap because of trouble with the transmission. All of the other cars were running well at the finish, the greatest time between any two of them being 13 minutes. Thatcher in an Ohio was second to Jenkins in the shorter race

and Gilchrist (Cino) third. Just 11 minutes behind Hearne, though he had considerable less than half the power, Jenkins was second in the long race, and Harry Knight, with his Indianapolis Westcott, was third; Matthews (Ohio) and Gilchrist (Cino) were fourth and fifth respectively. The summary:

One hundred and fifty miles, class C, under 300 inches displacement—Won by Johnny Jenkins, Cole, time, 2:46:29.84; second, Chas. Thatcher, Ohio, time, 2:51:19.0; third, J. K. Gilchrist, Cino, time, 3:00:28.88.

One hundred and ninety-seven miles, class C, under 600 inches displacement—Won by Eddie Hearne, Fiat, time, 3:29:03.20; second, Johnny Jenkins, Cole, time, 3:40:04.27; third, Harry Knight, Westcott, time, 3:53:38.75; fourth, Harry Matthews, Ohio, time, 3:56:19.58; fifth, J. K. Gilchrist, Cino, time, 4:01:59.60.

A. A. A. to Fight for Federal Aid.

At the September meeting of the Executive Committee of the American Automobile Association, held in New York City, the 39th state association in the national organization was enrolled—the North Dakota State Automobile Association being the addition. It is likely that the 40th state membership will go to North Carolina as the presentation of two new clubs, the Winston-Salem Automobile Club and the Greensboro Automobile Club, together with the Automobile Club of Rowan county now qualifies that state for membership. The Idaho list was swelled by the addition of the Bannock County Automobile Club of Pocatello and an early applicant from Florida will be the recently organized St. Johns County Automobile Association. It also was decided at the meeting that until December Federal aid in inter-state road building becomes an accomplished fact the A. A. A. will hold annual conventions in Washington, while Congress is in session. The object of the conventions is to accelerate the movement already given considerable impetus by the A. A. A. in favor of Federal aid, which recently has been espoused by Speaker Champ Clark and other men on high places.

New Date for Hartford Racemeet.

Although disappointed at not having automobile races during the Connecticut Fair at Charter Oak Park, the Automobile Club of Hartford, Conn., has arranged to have a big meeting next Thursday, 21st inst. The Fair Association had intended making the races a feature of the last day, but rain and mud, on the 8th and 9th inst., caused the closing of the fair before the time scheduled. Ralph De Palma was on hand and was disappointed, of course. Secretary W. T. Plimpton, of the automobile club, brought to the matter to the attention of the contest committee and as the only date De Palma has open is the 21st inst., that day was selected. The meet has the sanction of the A. A. A.

GLIDDEN BEGINS TO LOOM LARGE

Application of New Rules Inviting Amateurs Aids National Tour—Forty Entries and California Referee.

The resemblance of the 1911 Glidden tour to its predecessors has been still further changed. As designated in the original entry blanks, it remains a Grade IV contest, and pretty much everything else in the entry blanks remains unchanged except the reference to stock cars. To enter the tour, the only requisites now are \$25 and a car—whether it is a registered stock car or any other kind of a car makes no dif-

the pathfinding will be resumed with Macon, Ga., as the objective point, Valdosta being reached the next day and the journey being ended at Jacksonville, Fla., on Tuesday, 19th inst.

Indicative of the favor with which the altered conditions of the tour have met, 40 entries already are in hand, and as the entry list does not close until October 1st, it is expected that this number will be considerably swelled before the start is made on October 14th. A large number of the entries are from Southerners, of whom several have participated in South to North tours, and who therefore know the rigors of the road. One of the latest entries received is that of James R. Gray, who has entered a six-cylinder Thomas, which will

A. L. WESTGARD IN FLANDERS STARTING THE GLIDDEN PATHFINDING

ference. Which is to say that the ban on the eligibility of unregistered cars for the Glidden tour has been removed. Acting on the recommendation of the Manufacturers Contest Association, the proposed amendment to the reliability contest rules to permit of the running of sanctioned tours for other than registered stock cars which was to have gone into effect on January 1st, 1912, has been made immediately effective and was put in force on the 8th inst.

Headed by A. L. Westgard, the pathfinding party started from the A. A. A. headquarters in New York in two Flanders cars on Friday last, 8th inst., the first stop being Philadelphia. Gettysburg was reached the following day and on Sunday night, 10th inst., the party rested at Staunton, Va. Roanoke, Va., was reached on Monday, Winston-Salem on Tuesday and Charlotte, N. C., on Wednesday. Today (Thursday) Anderson, S. C., is the destination, and on Friday, 15th inst., the delegation will reach Atlanta, where a stop over Saturday will be made. On Sunday

complete the Atlanta team of three cars, the other two being Major Cohen's White and Inman Gray's American.

Governor Albert W. Gilchrist, of Florida, is the first of the governors of the nine states through which the tour will pass to accept the invitation of Governor Hoke Smith, of Georgia, to be his guest from state line to state line. Governor Gilchrist will join the party as soon as the state line just south of Valdosta is passed. As a further evidence of the interest and enthusiasm which the tour is arousing in the South, the city of Anderson, S. C., has offered a trophy valued at \$1,000, which is to be known as the Anderson South Carolina Cup. The terms upon which it is to be awarded have not been made public as yet. It is expected that similar trophies will be offered from other sections along the line of the tour. The official referee of the tour, who has but just been appointed, is P. J. Walker, president of the California State Automobile Association, who, with his wife, will make the journey from New York to Jacksonville.

TWO DAYS IN ONE AT MINNEAPOLIS

Referee Forbids First Day's Racing, Which is Crowded Into Next Day's Program—Moross's Troupe Performs.

There was some good time made on a bad course on Saturday, 9th inst., at Hamline track, near Minneapolis, Minn., during the racemeet conducted under the auspices of the Minnesota State Fair Association. Moross's racing stable was much in evidence, and Robert Burman with his Benz, and his mates, ran counter to other "stables," which also acquitted themselves favorably. The races were scheduled for Friday and Saturday, 8th and 9th inst., but the poor condition of the mile dirt track, due to rain, caused Col. Frank M. Joyce, first vice-president of the A. A. A., who was referee, to prohibit them on the first day. Consequently a double program was given on Saturday. Heroic methods put the course in fairly good condition but the turns were at no time safe on account of mud near the pole and all cars were compelled to take the center of the track. However, despite this handicap, Burman made two efforts to lower the track record for a mile, created last year by Oldfield in the same Benz, and came close to the goal, doing 50 seconds as against the record of 49½.

Most of the races were spirited contests. The five miles free-for-all handicap proved the most interesting and demonstrated some fine handicapping on the part of the officials. Burman was at scratch and Sandell, Firestone-Columbus, was sent off 50 seconds in advance of him, followed by McNoy, Cutting, 40 seconds; Nyquist, Buick, 35 seconds; Heineman, 30 seconds; Jagersberger, Case, 25 seconds, and Kilpatrick, Hotchkiss, 10 seconds. Burman got a good start, but it was not until the third mile that he began to overhaul those in front. He gradually wore down the leads of all save McNoy, whom he finally collared on the homestretch and beat out by a few lengths. His time was 4:49½. McNoy, Cutting, was second, and Jagersberger, Case, third.

Ray Harroun with the Marmon "Wasp" that he drove to victory at the Indianapolis 500 miles sweepstakes, gave a fine exhibition of speed driving and rapid-fire tire changing. It was a novelty event and proved not uninteresting. After completing the mile circuit twice he brought his car to a stop in front of the grandstands while the mechanics changed a front tire. This was completed in 50 seconds and he then finished the third mile, covering the three miles in 4:45. He also participated in a special three mile race with Heineman, Case. On account of the length of the Marmon, Harroun had to slow up at the turns and Heineman forged to the

front. At the head of the stretch he was several yards in advance but Harroun opened up and crossed the line a victor by 10 yards.

Burman retained the Remy Brassard by winning two straight heats of three miles each, although hard pressed by Lee Oldfield, Mercedes, and Kilpatrick, Hotchkiss, in both heats. Burman also took the five miles free-for-all from his team mates.

The small car race at five miles, which opened the program, was won by Jagersberger, Case. Heineman, his stable mate, was the only other contestant. Jagersberger also won the fifteen miles race from Nyquist, Buick, while Heineman took the five miles free-for-all handicap, in which the Moross stable did not participate. Nyquist, Buick, captured the five miles for class C cars of 301-450 inches displacement. The summary:

Five miles, class C, 231-300 inches displacement—Won by Jagersberger, Case; second, Heineman, Case. Time, 5:27.

Five miles, class C, 301-450 inches displacement—Won by Nyquist, Buick; second, McNay, Cutting; third, Sandell, Firestone-Columbus. Time, 5:44.

Fifteen miles, class E, under 300 inches displacement—Won by Jagersberger, Case; second, Nyquist, Buick. Time, 16:25½.

Three miles with tire change, exhibition—Ray Harroun, Marmon. Time, 4:45.

Five miles, class D, free-for-all—Won by Burman, Benz; second, Lee Oldfield, Mercedes; third, Kilpatrick, Hotchkiss. Time, 5:06.

Mile time trial for track record—Robert Burman, Benz. Time, 0:50¾. Track record, 0:49¾.

Three miles, class D, free-for-all, for Remy Grand Brassard, best two out of three heats—Won by Burman in two straight heats; second, Lee Oldfield, Mercedes; third, Kilpatrick, Hotchkiss. Time, first heat, 3:01¾; second heat, 2:53.

Three miles, special—Won by Ray Harroun, Marmon; second, Lou Heineman, Case. Time, 3:58.

One mile time trial, second attempt for track record—Robert Burman, Benz. Time, 0:50.

Five miles, class E, free-for-all handicap—Won by Heineman, Case (15 seconds); second, Jagersberger, Case (scratch); third, Nyquist, Buick (15 seconds); fourth, McNay, Cutting (10 seconds); fifth, Sandell, Firestone-Columbus (30 seconds). Time, 5:08¾.

Five miles, special, handicap, class C, 301-450 inches displacement—Won by Sandell, Firestone-Columbus (40 seconds); second, Nyquist, Buick (scratch); third, McNay, Cutting (40 seconds). Time, 5:32.

Five miles, free-for-all, handicap—Won by Burman, Benz (scratch); second, McNay, Cutting (40 seconds); third, Jagersberger, Case (25 seconds); fourth, Heineman, Case (30 seconds); fifth, Kilpatrick, Hotchkiss (10 seconds); sixth, Nyquist, Buick (35 seconds). Time, 4:49¾.

A. A. A. OFFICIAL OF RIGHT SORT

Prevents Texas Racemeet Until Track is Made Safe—Then Wilcox and Other Visitors Catch a Native Tartar.

While Robert Burman was taking a fall out of Time at the Brighton Beach races on Labor Day, and J. M. Rutherford and Louis Disbrow were doing the same thing on the beach at Old Orchard, Me., Howard S. Wilcox, of Indianapolis, the National star, and other Western "invaders," were doing good work in the Lone Star State, where, however, they caught something of a Tartar in the person of Carl Reeves, of Midland, Tex., who proved that he could "go some."

The two days' meet was held at Glenwood Park, near Amarillo, and was under the direction of the Panhandle Auto Fair Association of Texas. The track was only recently constructed and by special effort on the part of the officials, assisted by ideal weather, was in almost perfect condition. The racing had been scheduled to begin Saturday, 2nd inst., but on that date, and although there were several thousand people present, R. W. Carr, of San Antonio, state representative of the A. A. A., and a member of the contest board of the A. A. A., would not permit the contests to take place. The course was covered with several inches of dust which he knew would endanger the lives of the drivers should the program be carried out. At first there was angry protest, but believing that the way to prevent accidents is to remove the probable cause, Carr was firm in his declaration that the contest board, when granting a sanction for a racemeet believed that promoters should take every precaution to protect the lives of contestants, and as dust was the greatest of all dangers, he would not permit races on a course where it would be impossible for drivers to see what they were doing. The promoters then dismissed the spectators, refunding the admission price, and immediately had the track well watered and rolled down. This was done again on Sunday morning, and later three car loads of oil put it in good shape. They were well repaid for the work, as it not only put the track in excellent condition, but when the races were run on Monday, 4th inst., and Tuesday, 5th inst. (the latter date being granted by Mr. Carr on behalf of the contest board, on account of taking away the first day), it was fast and the spectators could see the contestants at all times. This was especially interesting, as nearly all of the contests were long ones, the program including two fifty miles races and a hundred miles event. Reeves, the native son, took one of the "fifties" and Wilcox took the other one and also the "century." In every race save one the speed was better than a mile a minute.

The sensation of the racing was the driving of Reeves, who in turn drove an E-M-F and a National, the latter of which was wrecked in the fifty miles race on the last day. While passing the grandstand in the final race, at a rate of more than 72 miles an hour, one of the wheels struck a rough place and the car turned turtle. The automobile was wrecked but Reeves only received a severe shaking up. On the first day he also had a narrow escape.

Wilcox established a track record for two miles at 1:41, which is but 3.11 seconds behind the national record of 1:37.89 held by Burman. The summary:

Monday, September 4.

Twenty miles, free-for-all—Won by Reeves, E-M-F; second, Day, Marion; third, Trippler, Buick. Time, 20:15.

Thirty miles, free-for-all—Won by Monckmeier, Staver-Chicago; second, Nikrent, Staver-Chicago; third, Reeves, E-M-F. Time, 29:06.

Two miles, for track record—Won by Wilcox, National; second, Johnson, Marmon; third, Reeves, National. Time, 1:42.2.

Fifty miles, free-for-all—Won by Reeves, National; second, Wilcox, National. Time, 44:37.

Tuesday, September 5.

Thirty miles, free-for-all—Won by Nikrent, Staver-Chicago; second, Monckmeier, Staver-Chicago; third, Johnson, E-M-F. Time, 28:27.

Sixteen miles, free-for-all—Won by Johnson, E-M-F; second, Trippler, Buick. Time, 15:15.

Two miles time trial—Wilcox, National. 1:41.

Hundred miles, free-for-all—Won by Wilcox, National; second, Monckmeier, Staver-Chicago; third, Mullins, Cadillac. Time, 96:52.

Fifty miles, free-for-all—Won by Wilcox, National; second, Johnson, Marmon, Reeves, National, wrecked. Time, 46:59.

Alco Abandons All Forms of Racing.

With the distinction of having won the Vanderbilt cup two successive years, the American Locomotive Co. is content to rest on its laurels and henceforth Alco cars will be seen no more in road and track events. Although the company but recently formally shied its castor into the racing ring and came out with a stable of three cars, which it was intended to enter in practically every event of importance this year, it has been definitely decided to withdraw. The reason for the action, it is explained, is that racing requires a greater amount of time and attention than the company cares to devote to it. The decision does not refer to properly arranged commercial vehicle contests, however. In appreciation of his services, Harry Grant has been presented with the old "No. 18" Alco with which he won the last two Vanderbilt races.

PIERCE ADOPTS REAL LONG STROKE

**New Engine and Clutch Brakes Distinguish Famous Maker's 1912 Cars—
Rich Bodies and Equipment.**

Long-stroke motor practice gradually is gaining ground in the camps of the American designers, even as it has won its way abroad. One of the best evidences in point is that the new Pierce-Arrow 66 horsepower motor is of that variety. The Pierce-Arrow Motor Car Co., of Buffalo, N. Y., is widely known as one of the most prudent of the leading manufacturers of this or any other country, and the few changes in the construction of its product that are announced from time to time are made only after long and painstaking research, and because of the fact, they are of almost world-wide interest. The fact that

is resented in greater degree by the latter type. The cylinder dimensions of the two smaller motors remain the same as at the present time, namely, with bores and strokes of $4 \times 5\frac{1}{2}$ and $4\frac{1}{2} \times 5\frac{1}{2}$ inches, respectively; the stroke-bore ratios being 1.28 and

nificance in a broad sense, since they tend merely to improve the efficiency of an otherwise well-standardized machine. Following the precedent established in 1908 when the trio of sixes first was introduced and the production of four-cylinder models

PIERCE-ARROW 36 HORSEPOWER FOUR PASSENGER TOURING CAR

PIERCE-ARROW 36 HORSEPOWER FIVE PASSENGER BROUGHAM

it has adopted for the largest of its three models a motor with cylinder dimensions of 5×7 inches, is occasion for more than usual remark. Last year the bore and stroke of the corresponding motor were $5\frac{1}{4} \times 5\frac{1}{2}$ inches, while the first sextuple motor marketed by the Pierce company—back in 1906, as a matter of fact—had $5 \times 5\frac{1}{2}$ inch cylinder sizes.

The stroke-bore ratio of the "66 horsepower" engine, therefore, has advanced from 1.1 in 1906 to 1.4 at the present time, the model which is about to be superseded the dimensions of which are $5\frac{1}{4} \times 5\frac{1}{2}$ inches, representing the test of a 1.048 ratio. Incidentally, and as illustrating the inaccuracy of the common method of rating, the 1906 and 1912 motors, both of which would be given an output by formula of 60 horsepower, actually have piston displacements of 648 and 825 cubic inches, respectively, and develop unmistakable differences in real power. The slower rotative speeds and strong pulling ability at slow speeds, of course, are advantages pos-

discontinued, the three models are closely similar; they are, so to speak, assorted sizes of the same product, and with a line of nine different body structures which are applicable to the 66 and 48 horsepower chassis, respectively, and five which are adapted to the 36 horsepower chassis, a complete range of 21 distinct and different machines is offered for the selection of the prospective purchaser.

Treating the three chassis as of one-design construction and referring merely to the detailed improvements which are included in the re-drawn specifications of the line, it is noteworthy that about the only discoverable change in engine construction consists of the introduction of a priming device to assist in starting. A hand pump located on the dash is ar-

PIERCE-ARROW 48 HORSEPOWER SEVEN PASSENGER TOURING CAR

1.24, respectively, which puts them into the class of motors commonly recognized as of the long stroke type in this country.

Barring the increase in the stroke of the large motor, the mechanical alterations in the new line of Pierce-Arrow cars, which just has been announced, are not of sig-

nificance in a broad sense, since they tend merely to improve the efficiency of an otherwise well-standardized machine. From this point it is readily swept into the cylinders at the first turn of the starting crank. On the 66 horsepower motor a compression relief valve, which locks open and shut, also has been adopted.

Pierce-Arrow cars have been electrically lighted as regularly equipped for several years, although the current supply for the lamps has been drawn from a storage battery. Provision is now made for the installation of an electric lighting generator, however, although none is regularly supplied. The water pump shaft on the left side of the engine is extended through the pump casing for the attachment of a driving coupling for the generator, while four bosses are cast on the crank case for the purpose of supporting such a device.

The plain cone type of clutch is employed, as before, but it is improved by the addition of a clutch brake to prevent that member from spinning when disengaged from its seat in the flywheel. The braking device consists of a pair of small disks which are mounted diametrically opposite one another and against which the rear face of the cone bears when fully withdrawn from engagement. As heretofore, a four-speed selective type of gearset is employed, which is mounted in the waist of the chassis. Its actuation is safeguarded by a clutch-interlocking device to prevent the movement of the shifting lever at all times save when the clutch is out of engagement.

Another of the chassis alterations is the lengthening of the rear spring members on the 48 and 66 horsepower models by four inches and the lowering of the arch

of the current models, with the exception of the 36 horsepower runabouts, which now have 127½ inch wheel base instead of 125. The tire sizes for the small runabout likewise have been increased from 36 x 4 inches to 36 x 4½ inches, while those of the 48 horsepower touring and enclosed

oiling system with distribution through the hollow bore of the crank shaft and pump return to the elevated reservoir, double ignition, paired cylinder castings of T-head form, telescopic exhaust manifold with selector effect, automatic carburetter and power-driven air-pump for tire inflation

LEFT SIDE OF MOTOR SHOWING MECHANICAL TIRE PUMP

VIEW OF GEARSET FROM BELOW SHOWING NEW CLUTCH BRAKE

of the three-quarter elliptic spring members. This change, coupled with a shifting of the attachment of the upper quarter spring from the top of the frame sills to an outside position level with the chassis, contributes to easy riding and also harmonizes well with the new body designs.

The wheel bases remain the same as in

models have been increased from 36 x 4½ inches in front to 37 x 5 inches, making them equal to those in the rear. The large chassis, when furnished with touring and enclosed bodies, still is equipped with 37 x 5 inch tires in front and 38 x 5½ inch in the rear.

Such engine details as the gravity-feed

purposes are retained. The double-jointed propeller shaft with separate torsion bar semi-floating rear axle, external-internal rear wheel brakes, designed to be independent of spring movement in their action, and other characteristic features likewise are unaltered.

In the design of the new bodies, however, considerable changes are involved, changes which not only bring the line up to date in every respect, but which in several ways are in advance of the practice of other manufacturers, judged from the motorist's own point of view. Thus the emergency brake and gear shifting levers have been brought inside the front doors of the closed-front bodies, whereby the bodies have been considerably widened. Instead of now seating directly on the frame members, the bodies therefore project slightly and are supported by plates extending over the frames. The doors are absolutely flush and present an unbroken exterior effect, while by dint of some little contriving the running boards have been cleared of cluttering miscellany, only the spare tire carrier remaining.

To effect this improvement the batteries have been stowed away in a compartment under the body, while the tool kit has been removed from its former compartment under the front seat and placed in a receptacle built into the apron that extends from the body to the running boards. By this means room for an additional supply of

gasolene has been obtained. The sides of the bodies now are nearly vertical and the additional interior space afforded is divided between additions to the dimensions of the seats and an increase in the thickness of the upholstery.

One of the body details of pleasing effect, both visible and comfort-carrying, is the treatment of the dash. The concave or slightly hooded pattern is employed, but the molding of the surface has been carried out in such a way that the graduation from the hood to the surfaces of the body proper is accomplished without the awkward break in continuity which commonly is encountered. A profitable innovation in this connection is the introduction of a novel form of dash ventilator which is ar-

for emergency accommodation in all enclosed cars which nominally are of five-passenger capacity.

Like the touring models, the enclosed car designs newly adopted are not without novel features. One of the most striking points is the treatment of the side doors, which are full length and built with arched tops. To meet the added height of the doors, which is greater than that of the roof edge, a swelled surface is employed with a mild suggestion of dormer effect. The general style of the enclosed bodies harmonizes with that of the touring models and is equally clean and artistic.

The equipment is absolutely complete, including, besides items which usually are classed as extras, such little conveniences

three exceptions. The 36 horsepower landaulet is now listed for \$4,900 instead of \$5,000, while the 48 and 66 horsepower landaus now list at \$6,100 and \$7,100, respectively, which is \$100 less than their former price.

Where Brandt Found Price No Barrier.

With all confidence in his heart as to the merits of his offering, it nevertheless was a decided surprise to Ernest H. Brandt, one of the division chiefs of the United States Motor Co., when he went down South recently and found that the Southerners think no more about paying \$5,000 for a big car that they like than they do about paying \$1,000 or \$1,500 for a smaller car. In fact he was amazed to find the extent to which price is ignored as a deciding point in relation to big cars, not only by Southerners but by practically everybody in the big car class.

"Most of my many years experience in the automobile field have had to do with medium and low price cars," Brandt said, in telling of his Southern trip in connection with arranging distribution for Stoddard-Dayton six cylinder cars with Knight engine. "In the last few years I have found that buyers of cars in the lower range of price compare prices very closely, and that a difference of even a few dollars may decide them one way or the other. It has been quite a different atmosphere for me, and quite a relief, to find that in this great country of ours there are thousands of people who do not question a price so long as the car itself is what they want. A thousand dollars more or less seems to make no difference to them. All they care about is that the car is what they want. It goes to show that manufacturers are safe in going ahead and developing new and radical improvements, and that if the improvements are real and important, the price will not be a stumbling block so far as big car buyers are concerned."

Engineers to Visit London in a Body.

Instead of going to the London show severally, it is probable that the American engineers who attend that function in November next will go jointly. The Society of Automobile Engineers has the matter in hand and as a sufficient party already practically is assured, the organization is making the necessary arrangements and is preparing to clasp a kindred hand across the sea, with the Incorporated Institution of Automobile Engineers, which will act the host on the "other side." In addition to the Olympia show, the more notable British factories and garages will be visited, likewise the Brooklands track and other points of automobile and historic interest: it is possible also that the visitors will devote one evening to technical discussion with the British organization. Afterward there will be a trip to France to visit a number of the more important automobile factories in that country.

PIERCE-ARROW FORD COMPARTMENT VENTILATOR ARRANGEMENT

ranged to afford ample cooling for the front compartment of the closed-front bodies but without unpleasant draughts. With this object, an opening is provided in the baseboard of the windshield, which extends for almost its entire length, and which is regulated by shutters on the front side. On the back side is a deflector vane which directs the inflow in a downward direction and so prevents a direct blast of air reaching the occupants of the front seats, while at the same time delivering a constant supply of fresh air to that portion of the vehicle in which ordinarily the degree of circulation scarcely is perceptible.

Another of the improved body details is the folding seat arrangement, the extra seats on the seven-passenger bodies being of such construction that while there are no obtruding supports to interfere with the feet of the passengers on the rear seat, they are of ample size and provided with comfortable arm rests. When out of use the spare seats may be folded against the side of the tonneau, three motions only being required to effect the change. The seats are locked when folded. Similar construction, but minus the arm rests, is used

as a device for lighting the gas headlights without leaving the driver's seat, sprags on all cars except those of 36 horsepower, the gasolene primer already described, and Yale locks fitted with a universal key which protect the hood, dash cabinets, tool compartments and Prest-O-Lite tank enclosure, which, as heretofore, is carried below the body. Standard equipment features include, in addition to the lighting outfit—gas headlights, combination oil and electric side and tail lamps, and electric number illuminator—a horn mounted inside the hood, "rain vision" style windshield, power tire pump, gasolene tank gauge mounted on the dash, shock absorbers, odometer, body fittings complete and a full set of tools.

Three-passenger roadsters, four-, five- and seven-passenger touring, broughams, landaulets, "suburban," landau and "vestibule suburban" bodies comprise the style list, these nine patterns being made for both 48 and 66 horsepower chassis, while the 36 horsepower chassis may be equipped with either three-passenger roadster, four- or five-passenger touring, brougham or landau bodies. The prices, ranging from \$4,000 to \$7,450, remain unchanged with

THE MOTOR AND THE MOVING VAN

Peculiar Conditions Affecting That Form of Vehicle and How They May Be Met—Lloyd's Opinions.

"Moving day" has lost some of its terrors—for the moving man—since the advent of the motor-driven van. For the members of that calling have not been particularly slow in making use of its advantages. Just how far it may be applied with economy and in what respects its use in the moving and storage warehouse business differs from that of other enterprises in which transportation plays an all-important part is a question which is ably discussed by Robert McA. Lloyd, vice-president of the General Vehicle Co., in that company's house-organ, "Elec-tricks." That Mr. Lloyd exhibits a decided leaning toward the peculiar advantages of the electric vehicle is natural, but it is noteworthy that in pointing out the especial fitness of the gasolene-propelled machine for long-distance haulage he treats what is sometimes considered a rival form of equipment in a perfectly fair manner.

"While I cannot speak with authority on the subject I venture to say that the average New York family moves oftener than any other family in the world, and it is natural that moving and storage facilities should have received the greatest amount of study in our city," says Lloyd. "The wagon or van drawn by horses has assumed a standard size and shape and the modern storage warehouses have features of design and equipment that possess similarity, which is doubtless the result of experience.

"The automobile builder has a simple problem in getting a suitable body for the moving van. The van body now used in New York for this work meets the requirements of the warehouse people. Its dimensions are satisfactory and it has good, big, smooth sides for display advertising. It has become the unit of measure for household goods. . . . I may say, furthermore, that the moving men as a rule are conscientious in their desire to get full measure into it, even if by so doing they break the legs off the tables and all the knobs off the sideboard.

"The change in motive power from horses to electricity or gasolene does not necessitate any change in the design of the standard van body, and it is not desirable to make it lighter or to put into it inferior workmanship or material, as the strains and shocks to which it is subjected are at least as severe where the vehicle is self-propelled as when drawn by horses. As a matter of fact these increase in proportion to the speed of operation.

"Assuming that the van body is now satisfactorily standardized for present pur-

poses, we have three kinds of power to select from—horses, electricity and gasolene. If we consider all of these without prejudice or sentiment we may be led to the conclusion that none of them is ideal for all purposes.

"There are doubtless a great many vans which are only used a few days in the year—in the months of May and October. It is not necessary to keep horses all the year round for these vans; they can be hired when wanted, and for long idle periods the vans may be stored at small expense in a vacant lot. It is difficult to estimate any advantage at the present time in substituting expensive motor vans for these, but the time is fast approaching when it will be impossible to secure sufficient horses for these vans when wanted, and when that time arrives the advantage will be with the motor van that suffers the least deterioration when idle.

"I am inclined to think that the electric van will suffer the least, as it is reasonable to suppose that by that time storage batteries may be hired for temporary use and that the van without battery may stand idle indefinitely without harm and may be started at a few minutes' notice, whereas the gasolene van will require some overhauling every time it is put into commission.

"The second class of work to be performed is that which is distributed more or less throughout the year, and which we all believe can be more satisfactorily and economically performed by motor trucks of some kind than by horses. These two classes each again must be divided into two classes, the long and short haul classes. The electric truck depending on storage batteries is limited in its radius of action from a charging station, but it has the advantage over the gasolene truck in simplicity, reliability and economy of operation, together with considerably less fire risk. It meets the requirements of all city work and a certain amount of suburban work.

"The gasolene truck is not limited in its radius of action and for that reason it is the only substitute in sight for horses on long country trips. It is a convenient addition to the equipment of a moving or warehouse business, but in many cases it is a serious question as to whether it pays to substitute it for horses for the short season in spring and fall when people are moving to and from distant country places, and the owners of gasolene vans endeavor to find other work for them sufficient to keep the investment active during a greater part of the year. It therefore becomes a competitor of the electric van in city service even if not purchased for that service.

"In comparing the relative merits of gasolene and electricity for the motive power of moving vans, we may point out that to carry a given load both vehicles should have the same wheels, axles, springs,

brakes, steering gear, driving gear and chains, frame and body, and that it is simply a question of which power plant is best for the work to be performed.

"On the one hand we have the storage battery, electric motor, controller and wiring, and on the other hand the gasolene motor, carburetter, fuel tank, magneto, ignition battery, radiator, cooling fan, oiling system, clutch, change gear, muffler, piping and wiring.

"The weight of the gasolene motive power is about the same as the electric. The gasolene fuel costs more for a given amount of work than the electric. The gasolene motive power requires more skill to operate. The cost of inspection and adjustment is greater for the gasolene motive power. The cost of replacing worn out parts over a long period is greater for the gasolene motive power. The liability of breakdown is greater in the case of gasolene motive power. The fire risk is greater for the gasolene motive power. The wear and tear on the wagon itself is greater for the gasolene for the reason that the gasolene power possesses greater possibilities for speed and greater strains are therefore suffered by it. Therefore, its tires, brakes, steering gear, etc., cost more per mile than those of the electric.

"I cannot imagine any possibility of operating a gasolene truck at as low a cost per mile or per day as an electric truck. I do not say that it does not pay to run a gasolene truck. That depends on how much you can obtain for the service, but I do say that it pays better to run an electric truck, providing, of course, that the service is within its radius of action. The gasolene truck should be kept as much as possible in long haul service and a higher rate per mile should be obtained for it.

"The electric is reliable for operation within a circle of 20 miles' radius, and I should estimate that 80 per cent. of the work done by moving vans for warehouses in New York is within this circle. If a man has a small business and can only use one wagon, with which he is obliged to make both long and short trips, the gasolene wagon is the only one which can do them both, but he should be very watchful that the profit made on long trips is not entirely absorbed by the loss on short ones.

"Motor vehicles, both gasolene and electric, have arrived at a state of perfection and standardization which makes it no longer necessary to view them with suspicion. Their merits and their faults are known. The fallacy of the cheap and poorly constructed vehicle has been laid bare. The dreams of storage batteries with unlimited capacity and gasolene engines that run forever without oil have been written off the books of manufacturers and users. The warehouse man recognizes the fact that automobiles that are worth having are not given away. Good ones involve a considerable investment and they cost money to maintain."

IMPROVEMENT OF THE LOCOMOBILE

Not Much Room for It, Most of It Being Centered on Rear Axle—Two New Body Styles.

Following the general tendency toward greater strength and accessibility of parts, the 1912 Locomobile "six," which just has been announced by the Locomobile Co. of America, embraces a brand new one-piece

styles, an inside driven coupe and a berline limousine, have been added; either of the new bodies may be had on the four or six cylinder chassis.

In the six cylinder chassis itself, the new rear axle housing which has been adopted is the most important change which has been made. As heretofore, the live axle is of the full floating type; differing from former practice, which embraced the use of a two-piece axle housing bolted together at the center, however, the new housing is a

lar torsion member formerly used has been replaced by one of pressed steel.

In general appearance the power plant of the 1912 "six" differs little from that of its predecessor. The same type of $4\frac{1}{2} \times 4\frac{1}{2}$ T-head cylinders, cast in pairs, is used, and the rigid manganese bronze crank case which for years has been a feature of Locomobile construction remains. Similarly, the distinctive Locomobile splash and force-feed oiling system has been retained, the connecting rod big end bearings being fit-

LOCOMOBILE FIVE PASSENGER TORPEDO MODEL, AND SEVEN PASSENGER TOURING CAR ON SIX CYLINDER CHASSIS

rear axle housing, which is a radical departure from its former practice. Except for this change and a few minor refinements of motor and chassis, which, while scarcely noticeable to the casual observer, nevertheless are indicative of the ceaseless effort to improve an always dependable and high

one-piece steel casting. The alloy steel tubes on which the weight of the car is carried are hydraulically pressed into position, and though it is stated that brazing is not necessary, as a further precaution against strain, the tubes are riveted in place. Obviously the new construction permits a

ted with small scoops which dip into troughs, the splashing of excessive quantities of oil onto the cylinder walls and the resultant smoky exhaust being prevented by suitably placed baffle plates.

In order properly to secure the large spiral gears in the cam shaft train, a slight improvement in the method of their attachment has been made. The new cam shafts terminate in a large flanged face-plate which fits into a corresponding recess in the gear hub. The face-plate on the cam shaft and the gear wheel then are firmly bolted together by means of four cap screws widely separated, the screws afterward being wired to preclude the possibility of their becoming loosened. The resultant coupling is such that the gears are held absolutely rigidly in place and the side thrust inevitable with large spiral gears cannot alter their position. One of the smaller detail refinements, which is none the less important, is that the magneto coupling, as heretofore of the universal jaw type, is enclosed in a grease packed housing. As the housing is perfectly tight it does not require frequent attention.

NEW LOCOMOBILE ONE-PIECE CAST STEEL REAR AXLE HOUSING

grade car, the "six," which made its first appearance last year, will be continued practically unchanged. The four cylinder chassis also will be continued and it will remain even more like its predecessors than will the newer model. But supplementing the regular Locomobile line, two new body

greater factor of strength while at the same time the differential mechanism is made very much more accessible, a large opening in the rear of the housing ordinarily covered by an aluminum plate, permitting its parts to be reached easily. Another change in structural detail is that the tubu-

TWO NEW LOCOMOBILE BODY STYLES, THE INSIDE DRIVEN COUPE AND BERLINE LIMOUSINE

The same four speed selectively operated change gear mechanism which has been used for the past six years is a feature of the 1912 models, and as heretofore it is enclosed in a manganese bronze case. Similarly the control mechanism, such as gear shift and emergency brake levers, and throttle and spark advance levers, remain

unchanged, though the type of accelerator has been changed slightly to afford greater ease of control. The tread of the new accelerator consists of two knurled rollers against which the sole of the driver's foot rests and which turn when the pedal is depressed. The possibility of the driver's foot slipping off the pedal, which might happen with the ordinary type of flat tread accelerator, thus is obviated.

entrance and exit, the auxiliary seats are automatically locked in position when folded back. The wheel base of both the "six" and the "four" remains unaltered, the former being 135 inches and the latter 120 inches; 36 x 4½ inch tires replace the 36 x 4 front tires formerly used on the six cylinder models,

seven-passenger touring car, or the four- or five-passenger torpedo, to \$6,050, \$6,150, and \$6,250 for the limousine, landaulet and berline, respectively. The four cylinder model also is furnished in six body styles, which range in price from \$3,500 for the touring car to \$4,800 for the berline, the price in all cases including complete equipment, embracing demountable rims and top. As heretofore high tension ignition is used exclusively.

New York's 1912 Tags Nearly Ready.

If preparedness will prevent it, Secretary of State Lazansky, of New York State, does not mean that there shall be such a rush of motorists to his office as heretofore has been the case when the time arrived for the annual change of number plates. To that end, about October 15, he will send out notices to the holders of registration cards information as to where they may get the plates.

Plates for the year 1912 will be ready by that date, and although it will not be necessary to display them on automobiles until February 1 of next year, it is hoped that before that time all of the 82,000 owners in the state will be possessed of their numbers. Next year's plates will be of red fused enamel, with the numbers in white enamel, and they will be of a much better quality than those which were supplied for the year 1911. They are now being made

INTAKE SIDE OF 1912 LOCOMOBILE SIX CYLINDER MOTOR

Except for the fact that the outsides of touring bodies have been made rather smoother than usual, the use of concealed door hinges and top latches furthering the effect, little change in general styles has been made. Running boards have been cleared, and thus may serve for the reception of suit cases or trunks, such items of equipment as tools and batteries being stowed in commodious spaces under the seats, and tires being carried at the back of tonneaux.

With a view to providing the acme of luxurious riding, particular attention has been paid the upholstery in all models. Seat cushions as well as the backs of the seats are 10 inches thick and are composed of springs and long white curled hair. The seven-passenger cars are equipped with the usual folding seats, though those in the new models are of a unique pattern. The bottoms are well upholstered but the backs are composed of a flexible leather strip which adjusts itself to the position of the occupant of the seat. Permitting of easy

LOCOMOBILE LIMOUSINE INTERIOR SHOWING AUXILIARY SEATS

the tire equipment on all the other models remaining 34 x 4½ all around on the four cylinder models and 37 x 5 on the rear of the "sixes." Six regular styles of body are made to fit the six cylinder chassis, and they range in price from \$4,800 for the

by the Manhattan Supply Co., in New York City, and will cost the state 39.6 cents each, whether it be for duplicates or original numbers. In anticipation that there will be an increased sale of cars, Mr. Lazansky has ordered 85,000 of them.

Methods of Magneto Mounting and Their Effects

Probably the greatest step forward in the development of the internal combustion motor for automobile use was made possible by the introduction of the magneto for ignition. If magnetos had been used from the first it is very probable that present day motors would have presented a considerably altered appearance at least, and, in view of the continual improvement which is being made in magneto ignition apparatus, it is not difficult to trace the causes of the greatly increased efficiency of present day engines.

Keeping step with the perfecting of magnetos, and ignition apparatus in general,

neto, and consequently manufacturers often were forced to place them where they could, irrespective of other conditions. That in many cases they failed to work, or that when they did work results were far from satisfying, scarcely is to be wondered at.

But if early designers underestimated the importance of placing the magneto so that it was accessible and also so that the wire leads to them should be as short as possible, to prevent the current leakage inevitable with festoons of wiring, there were other considerations which were overlooked as well. The most important of
